American, 10 % Hispanic; 77 % Women). Teachers will be recruited in consultation with school administrators and review of applications. Criteria for selection will include: location, subjects taught, and willingness to mentor OSU Fellows and participate in campus activities.

Organization, Management and Institutional Commitment: The PI and co-PI will be responsible for overall management of the project, and accomplishment of program goals. Faculty resource members will attend the Special Topics course each term and work with OSU Fellows on development of activities pertaining to their areas of expertise. A Project Coordinator will be hired to coordinate OSU Fellows activities, and assist with the internal evaluation, reports, webpage, and longitudinal tracking of impacts on current and alumnus Fellows.

Annual OSU commitments include: 1) One GTA from the College of Agriculture, 2) \$ 20,000 from the Research Office to be used towards Project Coordinator's salary (part), 3) CSS and SMILE staff time for delivery of the Science Education and Outreach course, 4) CSS, SMILE and the School of Education staff time for OSU Fellow and teacher training, and 5) Faculty Advisor time (diverse departments) for mentoring OSU Fellows.

Evaluation: Formative and summative evaluation will incorporate a "mixed methods" approach for ensuring validity of findings through triangulation of data. Internal evaluation will include 'before' and 'after' science content quizzes to determine student impact. A "Draw-a-Scientist-Test", coded to determine if the students' include aspects of themselves or of the OSU Fellows, will be used to assess K-12 student perceptions of scientists. As in Track I, feedback from mid and end year evaluation workshops will be incorporated for program improvement. The external evaluation will include classroom observations, interviews, focus groups, and surveys administered each year in fall and again in spring to K-12 students, K-12 Teachers, current and alumni Fellows, and faculty advisors. Qualitative data will be coded for themes based on program objectives, and triangulated with quantitative data from the surveys. The external evaluator will provide interim reports for formative evaluation. Annual summative evaluation reports will summarize and interpret results, and provide recommendations.

List of Faculty Participants: The OSU faculty team will consist of faculty with diverse backgrounds from science and education related departments: S. Rao (Entomology); E. Jensen (Forest Resources); P. Hayes (Plant Breeding); E. Sulzman (Soil Ecosystems); M. Dragila (Hydrology); J. Noller (Soil Mapping); H. Stotz (Post Harvest Technology); S. DeBano (Terrestrial Ecology); D. Wooster (Aquatic Ecology); R. Halse (Botany); M. Dalton (Education); E. Davis-Butts (Education); S. Bottoms (Education); Ryan Collay (Education).

School District Involvement: School administrators will assist with: 1) proposal development and selection of teachers, 2) funding for substitute teachers when participating teachers attend program-related activities, 3) scheduling to enable participating teachers train other teachers in the schools for program sustainability, 4) organization of events to showcase OSU Fellows-rural students achievements in local communities, and 5) contacting their districts and local businesses to seek supplemental funding. In remote areas, teachers will provide accommodations for OSU Fellows implementing the Science Blitz.

Bridging Track I and the Renewal: Track I success was largely due to the strong OSU-rural school partnerships that were established between 2002-2005. These also enabled us to sustain the program at a reduced level in 2005-2006, without a break, and without NSF funding. OSU students continued to enrich rural science education through support from Toshiba, CAS, Honors DeLoach Scholarship, and the Science Education and Outreach course. For 2006-2007, a grant has been received from Wells Fargo and additional proposals have been / will be submitted to Autzen, Toshiba, OSU Extension, the OSU Rural Initiative, and other agencies.

GRADUATE COUNCIL MEETING

**April 6, 2006
3:00pm, MU 212**

Present: Koenig (chair), Filtz, Francis, Gitelman, Harter, McCandless, Proebsting, Rettig, Rockey, and Tadepalli

Absent: Gupta, McLain, McMullen, Sanchez, Unsworth

Guests: Julia Jones, Katherine Hoffman, Ann Schaubert

1. Proposal for a new minor in Ecosystem Informatics

Julia Jones (Geosciences) introduced a Category II proposal to establish a new graduate minor in ecosystem informatics at OSU.

Jones informed the Council that the minor would be open to all OSU graduate students. She explained that the minor originated as part of an NSF funded IGERT (program now in progress) and as part of a strategic initiative funded by the Provost.

The minor involves a series of four courses, which have been taught in another form (599) for two years. There are five faculty committed to the long-term teaching of these courses. Four tenure-track faculty were hired for this purpose with the money provided by the Provost in support of the initiative in ecosystem informatics. Sustaining the teaching of this minor is assured by Provost's funding and by Jones continuing in her current position in the department of Geosciences.

Jones added that ecosystem informatics is appearing in job ads and offering a minor in the area, she believes, would give graduates of our University greater employability and provide OSU more visibility. No university in the United States currently offers a degree or minor in this field.

Alix Gitelman (College of Science) asked Jones to speak on the reasoning behind the ecosystem informatics courses not having coursework prerequisites especially considering the minor is open to any graduate student from any academic department. Jones answered that aside from not wanting to be exclusionary, the issues were timing and the disciplinary diversity of students. It was the hope that students could begin work on the minor immediately upon arrival at OSU and that since the students are coming from so many different disciplinary areas it didn't seem conceivable that they could identify any individual prerequisite course that would fit all students. Jones added that she does not anticipate that the students coming into the program would have a common set of knowledge but rather they would be trained to share their particular knowledge, cross bridges and build collaborative research proposals and do collaborative research projects.

Gitelman indicated that she believes informatics is the study of data and information and so she was surprised by there being no explicit mention of the discipline of statistics in the description

of the minor. Jones explained that when they wrote the proposal they did not have representation from the Statistics Department which she admits was an oversight. Since that time they have made attempts to integrate statistics.

When Jones left the meeting, more discussion concerning the past preparation of students and the possible need for prerequisites in one or more of the proposed minor courses ensued.

The Council felt that perhaps some of the courses should have prerequisites so that students are ready to grasp and wrestle with concepts rather than simply leaving a class with a “sense” of the topics presented. The Council’s concern was that the minor be rigorous. The Council decided to postpone a vote on the proposal and the courses that still need approval. After all the classes have been reviewed and approved by the College of Science and the Office of Academic Programs, the Council will review the proposals as they exist at that time as well as any supplementary material that might be provided such as additional liaison letters/messages. A formal vote on courses and the minor will occur at that time.

2. Category II Proposal to Revise Requirements for the MAIS (Master of Arts in Interdisciplinary Studies)

Ann Schaubert (Graduate School) reminded the Council that at its meeting of March 2, 2006 it was recommended that she go forward with a CAT II proposal to revise MAIS degree requirements. Today she brings that proposal to the Council. The proposal recommends making two changes. One would be to drop the College of Liberal Arts requirement (the requirement which states that at least one field among the three fields of study chosen must be selected from among the programs in the College of Liberal Arts) and the other is to add two new courses to the degree: IST 511, Introduction to Interdisciplinary Graduate Students and IST 512, Applying an Interdisciplinary Perspective. Adding the two courses increases the total degree credits from 45 to 49.

A motion was made and seconded to approve the CAT II proposal and the two new courses. All voted in favor. Motion passed.

3. Minutes from Previous Meeting

A motion was made and seconded to approve the minutes of March 2, 2006. All voted in favor. Motion passed.

4. Revision of the Graduate Program Review Guidelines

Sally Francis (Graduate School) brought to the Council suggested changes to the *Graduate Council Graduate Program Review Guidelines* and a set of proposed guidelines for three year internal reviews of new graduate programs. She also wished the Council to consider whether or not to establish reviews of graduate minors, graduate certificate programs, and service courses.

Graduate Council Program Review Guidelines

Francis introduced and the Council discussed the following changes:

- introduction of language to bring attention to a unit's efforts to increase and enhance diversity
- removal of language suggesting an OSU Research Office interview be a part of the site-visit agenda
- introduction of an additional template (for self-study cover sheet)

Francis then suggested a change in the management of the graduate program review panel. She suggested asking the external academic peer to serve as chairperson. She explained that occasionally when she phones prospective reviewers to request their services, she hears that the reviewer immediately assumes that he/she would be in charge of writing the review report. Additionally, Francis reported that external reviewers are getting, in most cases, an honorarium for their service.

As Francis envisions the change, the external academic peer member of the review panel would lead discussion and be the point person in the coordination of the review report. However a local person (a member of the review team who is also a member from the Graduate Council) would serve to move the review report forward here on campus. The peer reviewer would not be flown back to campus to present the final report to the Graduate Council or to the Provost.

A member of the Council asked if this is a more typical model found employed at other universities. Francis answered that at some universities the review teams are completely external. She also pointed out that accreditation reviews and CSREES (Cooperative States Research, Education, and Extension Service) reviews are external.

A motion was made and seconded to approve as amended (minor editorial changes) the changes to the Graduate Program Review Guidelines suggested by Francis. The revised guidelines will be effective Fall 2006. All voted in favor. Motion passed.

Proposed Questions for an Internal Three-Year Review of New Graduate Degree Programs

Francis proposed a list of seven questions to be formally asked of Department chairs/Program directors three years after the initialization of a new graduate degree program. Francis informed the Council that OUS does review new degree programs at five years, but that the Provost requested that an internal review be completed prior to that. It is the Provost's concern that promises of resources made during the CAT I process do not materialize, and an internal review would potentially identify problems (and give units time to address them) prior to the OUS external review.

Francis explained that the process would not involve the Graduate Council beyond the current request to consider and approve the seven questions included in the survey. The process would involve the Dean of the Graduate School submitting the three-year review survey to the Department Chair/Program Director and then forwarding the unit's response to Mina McDaniel in the Academic Programs Office and from there to the Office of the Provost.

After some discussion over the wording of the questions and the suggestion of including a preamble to remind the unit that the questions asked during an OUS external review will be very similar to the OSU internal review, Francis suggested that Hal Koenig present the approved three-year review guidelines to the Academic Senate's Executive committee when next he visits.

A motion was made and seconded to approve the three-year internal review guidelines as amended. All voted in favor. Motion passed.

Review of Graduate Minors and Certificates

Francis told the Council that the discussion of whether or not to review graduate minors and certificates was a conversation started last year at a previous Council meeting. Graduate minors at OSU have never been reviewed. This is of particular concern in the case of standalone minors which have no relationship to a corresponding graduate major. Bruce Rettig (Graduate School) reminded the Council that an MAIS student is permitted to select three standalone minors to complete the degree. Standalone minors have never been reviewed by the Graduate Council. Francis stated that it is even more crucial to review graduate certificate programs, because completion of them provides a transcript-visible credential and they can be earned independent of admission to a graduate degree program.

Francis asked the Council if it felt that a process to review minors and certificate programs should be instituted. She also asked for suggestions on how to develop the process if it were considered necessary.

The Council was unanimous in its feeling that a process should be instituted and after some discussion it was decided that a process be created that would require a self-study, but that the self-study would require less information and not involve a formal site visit. It was also suggested that an external reviewer would read the unit's survey responses/self-study and forward a report to the Graduate Council for approval. In response to a question from Francis about who would design the review process, the Council asked the Graduate School to design something for the Council to respond to next year.

Meeting adjourned

Three-Year Follow-up Review of a New Graduate Program

1. General Information

- a. Have you made major modifications in the program from the original proposal?
(include rationale)
- b. Do you foresee modifications of this program in the future?

2. Faculty Resources

- a. Please list faculty by name, FTE, and rank/title.

3. Enrollment/Degree Production

- a. How many student majors are currently in the program?
- b. How many degrees have been awarded, per year, since program implementation?
- c. Is the program delivered in alternative ways (e.g., distance delivery, off-campus)?

4. Accreditation/Advisory Bodies

- a. Is this program accredited? If so, by what agency? If not, will accreditation be sought?
- b. Please indicate if this program has a business/industry and/or professional advisory body.

5. Other Resources

- a. What is the current budget (present year) for this program?
- b. Have grants been generated through, or because of, this program?
- c. Evaluate the adequacy of other resources necessary to support this program (e.g., library, computer equipment, other equipment, facilities, labs).

6. Student Outcomes

- a. Are employment-related experiences required in this program (e.g., internship, student teaching, practicum, clinical experience)?
- b. Describe the capstone activity required of students in this program. Other major assessments?
- c. Are there professional licensure exams for this degree? If so, how have your students performed on these exams (e.g., how many students sat for the exam; what percentage passed)?
- d. What have you learned about the employment and/or further professional- or graduate-level educational activities of graduates from your program?

7. What else would you like to tell us about your program that was not addressed in this review?

GRADUATE COUNCIL MEETING

March 2, 2006

3:00pm, MU 212

Present: Koenig (chair), Filtz, Francis, Gitelman, McCandless, McLain, McMullen, Rettig, Rockey, Sanchez, Tadepalli, and Unsworth

Absent: Gupta, Harter, Proebsting

Guests: Logen Logendran, Ken Funk, Ron Adams, Ann Schaubert

1. Industrial and Manufacturing Engineering (IME) Review Report

Michael Unsworth (Oceanic & Atmospheric Sciences) presented the report of the Industrial and Manufacturing Engineering Graduate Council Program Review Committee to the Graduate Council. The review took place November 3, 2005.

Unsworth began with assuring the Council that the overall conclusion was that this was a very positive review and that the Program should certainly be continued. The Department has done very well over the years in developing attractive graduate areas of specialization. It has very good laboratory facilities. The Program seems very well matched with the needs of industry and in placing their graduates. Unsworth added that like so many other OSU departments, IME has lost a significant percentage of their staff over the years and without additional support it's hard to see how the Program can maintain its current level of productivity let alone expand both its teaching and research missions.

Unsworth presented the Council with the Review Panel's recommendations:

1. *At least one IME faculty position should be created over each of the next two years to restore faculty numbers and permit growth of the graduate program.*
2. *There are risks that a prospective merger with the Mechanical Engineering Department could adversely influence the Department's ability to recruit and retain high quality IME faculty and graduate students, but there are also potential benefits in a merger. We recommend that, if a merger proceeds, steps be taken to ensure that IME can be identified as a self-contained discipline with a clear graduate curriculum and faculty career path.*
3. *The review committee acknowledges the increased recruitment efforts by the department and recommends that they be continued*
4. *To broaden the graduate curriculum, and alleviate some of the impact of faculty losses we recommend that IME consider cross-listing courses with departments with common interests. Opportunity would seem strongest with Statistics (operations research for Manufacturing Systems majors) and Mechanical Engineering (material and materials processing for Nano/Micro Fabrication majors) although other relationships might also be built with*

Computer Science (Information Systems majors) and Exercise Science and Psychology (Human Systems majors). Developing these relationships would also satisfy the graduate students' desire for a broader range of courses

- 5. IME should publish a list of courses that will be offered over a two-year horizon to enable students to better plan their programs.*
- 6. We recommend the development of a graduate seminar series. It may be useful to create this as a course for credit, and require graduate students to attend. Such a series could include speakers from OSU, both from in IME and elsewhere, as well as speakers from industry. Academic speakers who require compensation for expenses could come from other universities in the region to minimize expenses, while those from farther away may be invited based on fiscal considerations. Possible sponsorship of the series by industry should also be investigated*
- 7. The Department, in association with College administration, should develop a flexible plan that matches graduate student numbers and teaching commitments to the number of faculty available.*
- 8. The Department should look into areas of research collaboration, which might be led by IME faculty or otherwise, that could take advantage of the excellent infrastructure in IME and lead to more research involving cross-disciplinary integration.*
- 9. The Department should consider mechanisms to avoid isolation of those working at ONAMI. These may involve improving transportation between ONAMI and campus, creating a student seminar series, and encouraging regular faculty interaction both professionally and socially.*
- 10. In order to keep an identity for IME it should retain department or a similarly clearly defined status. This will be critical for the continued recruitment of highly qualified faculty and graduate students.*
- 11. Some budget lines of IME should be kept separate from Mechanical Engineering to avoid erosion of the smaller program.*
- 12. IME should be allowed to hire faculty to replace those that have departed. This is critical to meet the new Graduate School rules regarding graduate coursework and would be an important show of support for the program.*
- 13. The Department should keep records of the quality of students applying and being accepted into the program, and should endeavor to compare intake quality with that of comparator departments.*
- 14. The Department should introduce an on-going plan to keep track of former students and their career progression.*

15. *The Department should investigate further the possible causes of the decline in graduate applications in recent years. For example is this a national trend, or are there special factors at OSU that need to be remedied?*
16. *The Department should consider developing a graduate internship program in collaboration with industry.*
17. *The Department should keep track of national rankings of graduate programs in IME departments and endeavor to use this knowledge to improve the ranking of IME at OSU.*
18. *Given the climate nationally (and particularly in Oregon) for the funding of higher education, it may be necessary to increase development efforts as noted in the self-study report. This is not a short-term process and requires proper cultivation of alumni and corporations. Efforts should be made to put together a strategic plan of how to accomplish this. Other than scholarship and assistantships, IME may also wish to consider an endowed seminar series and professorships to attract top faculty or support current faculty.*

Hal Koenig (College of Business) asked if the Council had any issues or requests for clarification from Unsworth. As there were none, he then asked Ron Adams (College of Engineering) if he would like to comment.

Adams thanked the Council for their efforts on the review. He then addressed the Panel's recommendations concerning the creation of a new School in the College of Engineering by the merging of IME with Mechanical Engineering. He assured the Council that as this merger moves forward work to retain the identities of the individual departments is a high priority with the College.

Adams informed the Council that utilization of the laboratory facilities at ONAMI will rise and that he is working with the parking department to solve the transportation problems that will result with additional students and faculty traveling to Building 11.

Adams also thanked Unsworth for reminding the Council of the fact that external visitors from all over the country are repeating the same message: OSU has a group of faculty that is not the right size. Adams told the Council that faculty in the College of Engineering (on an individual basis) out-performs the national average by about 30-40% and he suspects that other colleges at OSU can show similar statistics. Adams hopes that the Council can deliver this message to Administration: OSU faculty cannot sustain this high performance without additional resources.

Ken Funk (Industrial and Manufacturing Engineering) thanked Logen Logendran for the high quality of work he produced with the IME self-study. Funk also took a moment to comment that the panel's recommendations are very reasonable and helpful and he thinks that with the help of Dean Adams they are achievable.

Logen Logendran (Industrial and Manufacturing Engineering) was then given the opportunity to respond to the panel's findings and recommendations (appendix II).

David McCandless entered the meeting during Logendran's presentation and Ron Adams left.

When asked for questions or comments, the Council asked for Logendran to clarify the following issues in his statement:

- The decrease of International student applications in the nation, the Pacific Coast states and at OSU.
- The quality of IME applicants and students. (In response to questions about the GRE scores of recent students, Logendran explained that he was making a qualitative assessment of quality and argued that GRE scores are a very weak indicator of the performance of IME students.)
- The use of a departmental exit survey or an exit interview.

Funk and Logendran left the meeting.

The Council then discussed the merger of the IME and Mechanical Engineering departments. Prasad Tadepalli (Engineering) asked if the external reviewers thought the merger was a good idea. Unsworth responded that the reviewers were divided. Jim Johnson, the employer reviewer who also serves on the advisory committee to the Dean of the College of Engineering, thought the merger would bring greater collaboration between the two departments. Paul Cohen, the academic peer reviewer, claimed that many departments who had done this have suffered and have found it much harder to recruit and retain faculty. Unsworth informed the Council that he believed that this question was beyond the purview of the Panel. Tadepalli commented that ideally the Graduate Council would want a program review panel to be able to make this kind of recommendation or not make it, but he understands the difficulty and complimented Unsworth on the thoroughness of the review.

A motion to accept the report was moved and seconded. All voted in favor. Motion passed.

2. Minutes from Previous Meetings

A motion was made and seconded to approve the minutes of January 19, 2006 as amended. All voted in favor. Motion passed.

A motion was made and seconded to approve the minutes of February 2, 2006. All voted in favor. Motion passed.

A motion was made and seconded to approve the minutes of February 16, 2006. All voted in favor. Motion passed.

3. Update on the Category I Proposal to Create a Master of Science in Interdisciplinary Studies and Modify the Master of Arts in Interdisciplinary Studies

Ann Schauber (Graduate School) began by summarizing the responses she received from department heads regarding the proposed changes to the Master's Degree in Interdisciplinary studies. She received 13 responses from 6 colleges. The feedback was split: half supported the MIS degree with no language requirement, 3 supported the MAIS degree with no language requirement and 3 responses reported no preferences.

Schauber reported that she met with the MAIS advisory committee today and that the consensus within the committee is that the true issue is maintaining a flexible interdisciplinary studies degree, the name of the degree is unimportant.

Schauber was surprised to learn that the Curriculum Committee had already reviewed the CAT I proposal and had sent her questions about it. Schauber informed Marvin Pyle that the CAT I was still in the Graduate Council and that we are currently addressing questions closely related to issues raised in discussions at the Curriculum Council.

Schauber informed the Council that if they wished to move forward with the MIS degree, a new CAT I proposal will need to be written; this process could take another year. If they wish to approve the revised MAIS (remove the CLA requirement and add the two new courses), a CAT II proposal will be needed; if approved the revised MAIS could be effective Fall 2006.

Theresa Filtz (Pharmacy) suggested going forward with the CAT II proposal to revise the MAIS degree requirements now and following that up with a CAT I proposal (for a name change) at a later date.

Discussion ensued.

A motion was made to instruct Schauber to write a CAT II proposal to revise the MAIS degree was made and seconded. All voted in favor. Motion passed.

The meeting adjourned at 4:30 pm.

IME Department Response to the Graduate Program Review Report

1. *At least one IME faculty position should be created over each of the next two years to restore faculty numbers and permit growth of the graduate program.*

In June of 2005, the IME department lost three of its faculty members, including the former Department Head. In fall of 2005, a new assistant professor was hired to meet the needs in the Information Systems Engineering focus area. We agree that, in order to meet the current needs of the IME graduate program and to sustain growth, it would be necessary to recruit one faculty member in each of the next two years.

2. *There are risks that a prospective merger with the Mechanical Engineering Department could adversely influence the Department's ability to recruit and retain high quality IME faculty and graduate students, but there are also potential benefits in a merger. We recommend that, if a merger proceeds, steps be taken to ensure that IME can be identified as a self-contained discipline with a clear graduate curriculum and faculty career path.*

The efforts are currently under way to develop and submit a Category I proposal to form a school structure by merging the IME department and the Mechanical Engineering (ME) department. It is our intent to make sure that the structure and leadership proposed will ensure that the IME department continues to function as a self-contained discipline. The current Interim IME Department Head would continue to serve in the capacity as Interim IME Associate Head, reporting directly to the Head of the School of Industrial, Manufacturing, and Mechanical Engineering. The operations and budgetary issues associated with the IME department would be handled by the Interim IME Associate Head. Nevertheless, we anticipate that the direction in which the School should strategically move forward, concerning curricula, research, and other issues, would be jointly determined by the faculty of both departments and recommended by both Associate Heads, should there be one appointed for the ME department, and finally approved by the Head.

3. *The review committee acknowledges the increased recruitment efforts by the department and recommends that they be continued.*

The increased recruitment efforts, targeting regional universities in Oregon, and those nationally and internationally, were first instituted in the fall term of 2004. We intend to offer 4-8 graduate teaching assistantships to incoming graduate students in the fall term of 2006, depending upon the budget. The information on the offer of assistantships for fall of 2006 is posted on the IME website to encourage students to apply for the IME graduate program. In addition, we are continuing our recruiting efforts this academic year by making recruiting presentations at regional universities. Four universities (Western Oregon University, University of Portland, Willamette Universities, and George Fox University) have been contacted, and four recruiting presentations to graduating seniors at these universities have been made. Several students who attended these recruiting presentations have expressed interest in pursuing graduate studies in IME. They will all be invited to attend the College wide graduate student recruiting event, scheduled to be held on Friday, March 10, 2006. The day's events are planned to include several activities including lab tours, campus tour,

meeting with IME graduate faculty, current graduate student presentations, and a Potluck at Westminster House for invitees, current students, the IME staff, the IME graduate faculty, and their families.

4. *To broaden the graduate curriculum, and alleviate some of the impact of faculty losses we recommend that IME consider cross-listing courses with departments with common interests. Opportunity would seem strongest with Statistics (operations research for Manufacturing Systems majors) and Mechanical Engineering (material and materials processing for Nano/Micro Fabrication majors) although other relationships might also be built with Computer Science (Information Systems majors) and Exercise Science and Psychology (Human Systems majors). Developing these relationships would also satisfy the graduate students' desire for a broader range of courses.*

The recent loss of IME faculty and our obligation to teach the required undergraduate courses to meet the needs of our undergraduate programs as well as the requirements set forth by the ABET (Accreditation Board for Engineering and Technology) have limited our ability to teach all of the required and elective IME graduate courses. For example, this academic year (2005-06), neither of the Operations Research courses (IE 521 and IE 522) is taught. These are strictly graduate courses in the Manufacturing Systems Engineering focus area. Although courses comparable to them are taught by the Statistics Department, they are all slash courses which does cause a problem in light of the 50% graduate only courses requirement.

Nevertheless, the current IME graduate students have been asked to take these courses from the Statistics Department to avoid any delays in completing their graduate degree. The Nano/Micro fabrication focus area is highly interdisciplinary, and the students majoring in this are required to take courses from the School of Electrical Engineering and Computer Science, and the Departments of Mechanical Engineering and Chemical Engineering, in addition to the required and elective courses taught in the IME department. Likewise, students from these other departments take Nano/Micro Fabrication courses taught in the IME department to meet their program requirements. Similar situations exist with the courses taught in the Human Systems Engineering focus area and those taught in the Exercise Science and Psychology departments. To summarize, the opportunities for IME graduate students to take courses taught in several other departments at OSU currently exists and they do take them, although they are not cross-listed in the catalogue. With the efforts to merge the IME and ME departments currently under way, we will start with exploring the possibility of cross-listing some of the courses taught in IME with ME.

5. *IME should publish a list of courses that will be offered over a two-year horizon to enable students to better plan their programs.*

As noted in item (4) above, the uncertainties in graduate faculty availability to teach both required and elective courses in IME has hindered us from publishing a list of graduate courses for two years in advance. If course offerings are published in advance, we will need to make sure that all of the courses are taught at the right time as noted in the communiqué to the graduate students. This would be very hard to meet, given the fewer number of graduate faculty and the uncertainties associated with budgets and other factors to allow hiring faculty

to replace the ones who left last summer. We will, however, try to disseminate accurate information on course offerings in advance to the extent it is feasible.

6. *We recommend the development of a graduate seminar series. It may be useful to create this as a course for credit, and require graduate students to attend. Such a series could include speakers from OSU, both from in IME and elsewhere, as well as speakers from industry. Academic speakers who require compensation for expenses could come from other universities in the region to minimize expenses, while those from farther away may be invited based on fiscal considerations. Possible sponsorship of the series by industry should also be investigated.*

With the merger of IME and ME departments, anticipated to take effect in fall of 2006, we see two options to offer a graduate seminar series. The ME department has an ongoing seminar series in which the faculty from the ME department and those from other departments in the COE have presented seminars. These seminars are attended by the ME graduate students. One option is to require the IME graduate students to attend this seminar series along with the ME graduate students. The other option is to introduce a seminar series, or even seminars from time to time as we see fit, in which the IME faculty, and subject experts from industry as well as those from other universities but budget permitting, present their work. We intend to explore these two options and decide on using one of the two or both options that suits the best for our graduate students. When implemented, the attendance in a minimum number of seminars offered in the IME department and/or ME department will be made a requirement for all IME graduate students.

7. *The Department, in association with College administration, should develop a flexible plan that matches graduate student numbers and teaching commitments to the number of faculty available.*

Currently, there are about 40 IME graduate students and 8 graduate faculty members. A couple of us have assigned service/administrative responsibilities that total up to approximately 1.0 FTE (0.6 FTE – IME Interim Department Head; and 0.3 FTE – IME Graduate Program Chair), which leaves us with only 7 FTE of graduate faculty for teaching and research. The availability of graduate faculty and their area of (research and teaching) expertise, the number of graduate students, and whether or not a course is required or elective have been critical in determining which courses to offer in an academic year. In other words, we have exercised a flexible plan in making these determinations and will continue to do so.

8. *The Department should look into areas of research collaboration, which might be led by IME faculty or otherwise, that could take advantage of the excellent infrastructure in IME and lead to more research involving cross-disciplinary integration.*

Some research collaboration exists between the IME faculty and faculty from other departments as well as those from other universities. The projects funded by HP-Foundation, UTC/RITA (University Transportation Center/U.S. Department of Transportation's Research and Innovative Technology Administration), and those funded and pursued in Nano/Micro fabrication are a few examples of this. The imminent merger of the IME and ME departments

should create an environment that is conducive for more cross-disciplinary research collaboration.

9. *The Department should consider mechanisms to avoid isolation of those working at ONAMI. These may involve improving transportation between ONAMI and campus, creating a student seminar series, and encouraging regular faculty interaction both professionally and socially.*

The graduate students who work on projects funded by ONAMI have offices in HP-Bldg. 11. The reasons for this are many fold – better student office facilities, all or most of the equipment for running the research experiments are housed in Bldg. 11, and allows for students working on different projects to interact with each other in laboratories and offices, all in one location. While all of the issues associated with the transportation of students between OSU and HP-Bldg. 11 may not have been addressed, there was some discussion with the students about this and they were encouraged to purchase an affordable car. We will bring this to the attention of the IME faculty who work with students on these projects to help alleviate any further concerns they might have about transportation. The graduate students majoring in Nano/Multi fabrication are required to take courses that are common to all IME graduate students (IE 552, IE 563, IE 594 (for M.S. thesis/Ph.D. dissertation), and for PhD students: IE 521 or IE 522, and IE 545 or IE 570). So there are opportunities for them to interact with graduate students majoring in other focus areas (Manufacturing Systems Engineering, Information Systems Engineering, and Human Systems Engineering). A seminar series for the graduate students, as noted in (6) above, should give them opportunities for further interaction with faculty and their fellow students in other IME focus areas.

10. *In order to keep an identity for IME it should retain department or a similarly clearly defined status. This will be critical for the continued recruitment of highly qualified faculty and graduate students.*

We realize that the identity of IME as a separate unit is very important for the recruitment of high-caliber graduate students and faculty. In the merger of the two departments (IME and ME), we intend to preserve this identity as best as we could.

11. *Some budget lines of IME should be kept separate from Mechanical Engineering to avoid erosion of the smaller program.*

Although the two departments will have a few overarching common goals after the merger, each will have their own goals and objectives that best suits their need. Thus, it is important that the budget lines are kept separate for the two departments in order to channel the funds to activities that are deemed important to realize the most benefit.

12. *IME should be allowed to hire faculty to replace those that have departed. This is critical to meet the new Graduate School rules regarding graduate coursework and would be an important show of support for the program.*

We agree that it is important to hire new faculty to replace those who have left to teach strictly graduate courses to meet the 50% graduate only courses requirement implemented recently, and to sustain growth of the IME graduate program. It is our expectation that the two vacant positions would be replaced, one in each of the next two years.

13. *The Department should keep records of the quality of students applying and being accepted into the program, and should endeavor to compare intake quality with that of comparator departments.*

A procedure would be put in place, beginning fall of 2006, to record the quality of students that are accepted into the IME graduate program. The proposed statistics to be tracked are GPA, GRE scores, and TOEFL scores of students whose native language is not English.

14. *The Department should introduce an on-going plan to keep track of former students and their career progression.*

Typically, the IME faculty members stay in touch with their former PhD students, primarily as a result of their pursuit of joint publications in journals based on the students' doctoral research. So their career progression is generally known, although currently there is no formal mechanism in place to track this. Similar collaborative activities do take place between the faculty and their former MS students, perhaps not to the same extent as those with their PhD students to know their career progression. Often there is contact between the professor and student as soon as the student graduates and takes up his/her first job, but with time, change of position, employer, and/or location the contact may not be there. We have now implemented a process to track this information, starting with students who graduated recently.

15. *The Department should investigate further the possible causes of the decline in graduate applications in recent years. For example is this a national trend, or are there special factors at OSU that need to be remedied?*

The IME Graduate Program Chair serves on the College of Engineering (COE) Graduate Council. In one of the recent Council meetings, some data on graduate student (US and international) enrolments at OSU and COE for the past few years was made available. Also, data on the total number of (graduate and undergraduate) international students enrolled at universities in Oregon and other States in the Pacific region for the past few years was made available. These data might help explain the reasons for the decline in applications for admission into the IME graduate program.

The total number of international students enrolled in the universities in Oregon has *steadily declined* from 6612 in 2000/01 to 5490 in 2004/05 (i.e., 17% drop). For the same data, the percentage change for 2004/05 from 2003/04 is -6.2%, by far the largest decrease compared to the other states in the Pacific region (Alaska +2.8%, California -2.8%, Hawaii +2.1%, and Washington -0.8%, for a Pacific region net total decrease of -2.5%). Nationally, some regions have seen a net increase (Mountain 0.7%, South 0.5%, Southwest 3.1%), while others have seen a net decrease (Midwest -2.9%, Northeast -3.0%) as did Oregon.

The number of (US and international) graduate students in the COE has decreased from 586 in 2002 to 508 in 2005 (-13.3%), while that for the COE international graduate students has decreased from 359 to 204 (-43%). For the same time period, the number of international graduate students at OSU decreased from 820 to 612 (-25.4%). As the majority of applications for graduate studies in IME come from international students, the data above may help explain the reasons for the decline in graduate applications in IME. The increased screening procedures applied to the international students at U.S. Consulates for issuance of a visa since 9/11 may also have contributed to the decline. It is important to note that the number of applications for all graduate programs in the COE decreased from 2195 in 2003/04 to 1065 in 2004/05, a 51.5% drop. For the same time period, the number of applications for graduate studies in IME also decreased by about the same percentage (51.2%; from 121 to 59).

16. *The Department should keep track of national rankings of graduate programs in IME departments and endeavor to use this knowledge to improve the ranking of IME at OSU.*

The U.S. News and World Report conducts a survey of all graduate programs in engineering schools in the U.S. to establish a ranking of graduate engineering programs across the country. The factors used in evaluating an overall score for ranking include peer assessment, recruiter assessment, average quantitative score, acceptance rate, Ph.D. students/faculty ratio, membership in NAE, engineering school research expenditures, research expenditures per faculty member, Ph.D.'s granted, and total graduate engineering enrollment. Conceivably, the same or similar set of factors would be used to establish the ranking of graduate programs in individual disciplines, including IME. While improving the performance/score in each factor that contributes to the evaluation of the overall score is not within our control, some are, as pointed out in the review committee's report. As a department we will aggressively pursue efforts to recruit *more* high-caliber Ph.D. students in IME, increase the graduate enrollment in IME, and increase research funding.

17. *Given the climate nationally (and particularly in Oregon) for the funding of higher education, it may be necessary to increase development efforts as noted in the self-study report. This is not a short-term process and requires proper cultivation of alumni and corporations. Efforts should be made to put together a strategic plan of how to accomplish this. Other than scholarship and assistantships, IME may also wish to consider an endowed seminar series and professorships to attract top faculty or support current faculty.*

The number of high-caliber graduate students that we can attract is dependent upon our ability to offer competitive scholarships and assistantships. As noted in the self-study report, we realize that it is important to pursue fund raising to supplement the number of scholarships and assistantships offered from research projects and State funds. We will pursue efforts to raise funds as best as we could from Alumni and corporations.

GRADUATE COUNCIL
PROGRAM REVIEW
OF
GRADUATE PROGRAMS IN THE DEPARTMENT OF INDUSTRIAL
AND MANUFACTURING ENGINEERING
November 2005

OVERALL CONCLUSION AND RECOMMENDATION:

Recent restructuring of the graduate program in the Department of Industrial and Manufacturing Engineering has created an attractive set of specializations supported by good laboratory facilities. This program is well matched to the needs of industry. We recommend that the program be continued with the additional support of new faculty hires to replace recent losses. Other specific recommendations are contained in the report.

SUMMARY OF SPECIFIC RECOMMENDATIONS:

1. *At least one IME faculty position should be created over each of the next two years to restore faculty numbers and permit growth of the graduate program.*
2. *There are risks that a prospective merger with the Mechanical Engineering Department could adversely influence the Department's ability to recruit and retain high quality IME faculty and graduate students, but there are also potential benefits in a merger. We recommend that, if a merger proceeds, steps be taken to ensure that IME can be identified as a self-contained discipline with a clear graduate curriculum and faculty career path.*
3. *The review committee acknowledges the increased recruitment efforts by the department and recommends that they be continued*
4. *To broaden the graduate curriculum, and alleviate some of the impact of faculty losses we recommend that IME consider cross-listing courses with departments with common interests. Opportunity would seem strongest with Statistics (operations research for Manufacturing Systems majors) and Mechanical Engineering (material and materials processing for Nano/Micro Fabrication majors) although other relationships might also be built with Computer Science (Information Systems majors) and Exercise Science and Psychology (Human Systems majors). Developing these relationships would also satisfy the graduate students' desire for a broader range of courses*
5. *IME should publish a list of courses that will be offered over a two-year horizon to enable students to better plan their programs.*

6. *We recommend the development of a graduate seminar series. It may be useful to create this as a course for credit, and require graduate students to attend. Such a series could include speakers from OSU, both from in IME and elsewhere, as well as speakers from industry. Academic speakers who require compensation for expenses could come from other universities in the region to minimize expenses, while those from farther away may be invited based on fiscal considerations. Possible sponsorship of the series by industry should also be investigated*
7. *The Department, in association with College administration, should develop a flexible plan that matches graduate student numbers and teaching commitments to the number of faculty available.*
8. *The Department should look into areas of research collaboration, which might be led by IME faculty or otherwise, that could take advantage of the excellent infrastructure in IME and lead to more research involving cross-disciplinary integration.*
9. *The Department should consider mechanisms to avoid isolation of those working at ONAMI. These may involve improving transportation between ONAMI and campus, creating a student seminar series, and encouraging regular faculty interaction both professionally and socially.*
10. *In order to keep an identity for IME it should retain department or a similarly clearly defined status. This will be critical for the continued recruitment of highly qualified faculty and graduate students.*
11. *Some budget lines of IME should be kept separate from Mechanical Engineering to avoid erosion of the smaller program.*
12. *IME should be allowed to hire faculty to replace those that have departed. This is critical to meet the new Graduate School rules regarding graduate coursework and would be an important show of support for the program.*
13. *The Department should keep records of the quality of students applying and being accepted into the program, and should endeavor to compare intake quality with that of comparator departments.*
14. *The Department should introduce an on-going plan to keep track of former students and their career progression.*
15. *The Department should investigate further the possible causes of the decline in graduate applications in recent years. For example is this a national trend, or are there special factors at OSU that need to be remedied?*
16. *The Department should consider developing a graduate internship program in collaboration with industry.*

17. *The Department should keep track of national rankings of graduate programs in IME departments and endeavor to use this knowledge to improve the ranking of IME at OSU.*
18. *Given the climate nationally (and particularly in Oregon) for the funding of higher education, it may be necessary to increase development efforts as noted in the self-study report. This is not a short-term process and requires proper cultivation of alumni and corporations. Efforts should be made to put together a strategic plan of how to accomplish this. Other than scholarship and assistantships, IME may also wish to consider an endowed seminar series and professorships to attract top faculty or support current faculty.*

1. **INTRODUCTION**

The Graduate Council conducted a site review of graduate programs in the Department of Industrial and Manufacturing Engineering on November 3, 2005. The review team, who all contributed to this report, consisted of:

Michael Unsworth, College of Oceanic and Atmospheric Sciences, Chair
Tracy Daugherty, Department of English
Alix Gitelman, Department of Statistics
Paul Cohen, Department of Industrial and Manufacturing Engineering, Penn State University
James Johnson, Intel Corporation, Portland

The self-study report of the program, which was provided in advance, gave a detailed description of the department and its history, strengths of the faculty, research facilities, graduate program components, assessment procedures and proposals for future developments. The review team appreciates the hard work that went into the preparation of the self-study, which greatly helped in informing the team during the review process.

The team met with Sally Francis, Dean of the Graduate School, over dinner on the evening before the site visit. This was a useful meeting for clarifying procedural issues and identifying areas of responsibility for the review team members.

In the site visit, on November 3, the team began with a series of meetings in Covell Hall with the Interim Department Chair (K. Funk), Graduate Program Chair (R.L. Logendran), Dean (R. Adams) and an Associate Dean (C. Bell) of the College of Engineering, followed by a tour of facilities in Covell. The Dean and Dr Funk both informed us of ongoing discussions concerning restructuring of the departments in the College, and these are referred to at several points in our review. A visit to the Oregon Nanosciences and Microtechnologies Institute (ONAMI) on the Hewlett Packard campus provided the review team with opportunities to see the impressive facilities being established there and to meet the Directors for discussion of the ONAMI role in graduate training. After lunch in Covell Hall, the team had sessions with the Graduate Committee, faculty, and graduate students before concluding with an exit interview with Drs Funk and Logendran.

This review includes an analysis of the Graduate Program, its mission, students, curriculum and organization, a section on the level of productivity and quality of the students and faculty, and a discussion of outcomes of the program, including the professional viability of the graduates, their satisfaction with their training, and the ranking of the program on a national scale. In this report paragraphs of comment and analysis by the Review Team are italicized, as are recommendations. The recommendations are made at the end of each section, and numbered sequentially. They are also drawn together in a summary preceding this introduction.

2. BACKGROUND

2.1 The Department, its mission, and the evolution of its Graduate Programs

The Industrial and Manufacturing Engineering (IME) Department at Oregon State University is one of the seven departments and a school within the College of Engineering. The others include Bioresource Engineering, Chemical Engineering, Civil, Construction and Environmental Engineering, Mechanical Engineering, Nuclear Engineering, and the School of Electrical Engineering and Computer Science. In terms of enrollment, the IME department is the fourth largest, with approximately 11% of the total enrollment (undergraduates and graduates) in the college.

Industrial and manufacturing engineering focuses on the use of knowledge from the mathematical, information, physical, and human sciences to design, develop, manufacture, implement, operate, and improve systems that are capable of producing and delivering high quality products and services. The MSE concentration focuses on the use of design, analysis, and technology to create efficient systems capable of producing highly reliable and economically competitive products by employing resources such as material, labor, machine tools, and computing equipment. NMF comprises the integration of silicon and non-silicon micro-fabrication techniques with more conventional macro-scale manufacturing technologies for the purposes of economical system miniaturization in conventional engineering materials. ISE uses information to combine the technologies, people, processes, and organizational mechanisms for the purpose of improving organizational performance. HSE uses engineering methods and knowledge from the physical, biological, information, social, and management sciences to develop, implement, operate, evaluate, and improve human-machine, human-human, and human-organization systems.

Working with advice from experts in industry, the department has developed a program with four areas of concentration at the graduate level: 1) Manufacturing Systems Engineering, 2) Nano/microfabrication, 3) Information Systems Engineering, and 4) Human Systems Engineering. These areas of concentration have been in place since January 2001. Prior to that, from the mid to late 1990s, the department offered a Master of Engineering degree program in Manufacturing Engineering (in collaboration with Portland State University). Initially, enrollment in this program was high but within a few years it dropped precipitously due to industry changes. The program was terminated

in the fall of 2004. The department has also suffered a net loss of two faculty positions in the last five years, including the departure of the department head in June 2005. This leaves the department with an interim head and with eight graduate faculty members, two each in the department's four areas of concentration. While these numbers provide a workable balance, faculty members struggle to offer enough sections of core courses. Outside instructors are sometimes hired to cover instructional gaps.

At this time, the department offers graduate programs leading to M. Eng, M. S. (with thesis or non-thesis options), and Ph.D. degrees in industrial engineering. Of the eight graduate faculty members, five are Associate Professors and three are Assistant Professors.

The department's mission is closely allied with the College of Engineering's Business Plan, and prioritizes the development of work-ready engineers, the development of collaborative research clusters, and the pursuit of diverse funding sources in order to stay flexible in the face of industry fluctuations and changes in academic support structures. In order to achieve these goals, the department strives to recruit top students regionally and nationally, so that masters-level graduates are prepared to step into industry and doctorate-level graduates are prepared to step into academia; the department strives to collaborate with industry and government through leadership roles, so that the department can secure more research dollars; finally, the department strives to maintain contact with IME alumni, particularly those in key positions in industry and academia, to garner additional financial support.

The Review Group concurs with these goals, seeing them as consistent with the mission of the College of Engineering and as appropriate for preparing graduate students for careers in industry and elsewhere.

Currently, because of recent faculty losses, the IME department is unable to meet the university requirement that 50% of a graduate student's credit hours be earned in graduate-only courses. The department has requested a temporary exemption from the 50% rule while it drafts a plan for meeting the requirement. As part of this plan, the department hopes to hire a new tenure-line faculty member but it is awaiting implementation of a decision by the Dean of Engineering to merge the IME department with Mechanical Engineering (ME) to form a new school of IME and ME. The proposed merger has delayed the IME department's job search, and it presents other challenges to the department as well, testing mainly whether it can retain a distinct identity within a larger school. While faculty members have adopted an optimistic attitude toward this change (anticipating opportunities for new collaborative efforts and for expanding the curriculum) they worry about recruiting new students and faculty if the department loses its disciplinary clarity. Faculty members and graduate students felt that, under the new school model, IME should maintain the integrity of its budget lines, curriculum, and P & T procedures. Without assurances in these areas, they told us that morale would suffer greatly within the IME program.

The Review Group recognizes the challenges that the loss of faculty have created, and the concern in the Department about restructuring. For IME to flourish it must maintain a viable number of faculty and be able to attract and retain high quality faculty and students.

Recommendations:

1. *At least one IME faculty position should be created over each of the next two years to restore faculty numbers and permit growth of the graduate program.*
2. *There are risks that a prospective merger with the Mechanical Engineering Department could adversely influence the Department's ability to recruit and retain high quality IME faculty and graduate students, but there are also potential benefits in a merger. We recommend that, if a merger proceeds, steps be taken to ensure that IME can be identified as a self-contained discipline with a clear graduate curriculum and faculty career path.*

3. THE GRADUATE PROGRAM

3.1 Graduate students

Graduate education in the Department of Industrial and Manufacturing Engineering focuses on producing “work ready” engineers, at both the M.S. and Ph.D. levels. To this end, there is an emphasis on applications-oriented coursework and on providing students opportunities to work in industrially relevant, and in many cases, state-of-the-art laboratories. Every entering IME graduate student is expected to have taken undergraduate courses in statistics and probability, linear algebra, computer programming and engineering economy. Most M.S. graduates go on to careers in industry, while many Ph.D. graduates, who have more grounding in theory as well as application, go into academics or other research environments.

In this section, we provide observations on several aspects of graduate education in the Department: 1) student recruitment; 2) quality and retention of students; 3) student support; 4) employment of graduates; and 5) current student and alumni satisfaction with the program. These observations are based on the self-study materials supplied by the Department, including the results of three surveys (current students, Graduate School Exit Survey, alumni survey), and interviews conducted in November 2005 during our visit to the Department.

Student Recruitment

In the past five years the number of applicants for graduate study in IME has ranged from 59-205, with the low of 59 coming in the most recent year (2004/05). As a percentage of all applicants for graduate study in The College of Engineering, the number of applicants to IME has dropped over the period 2001-2005 from a high of almost 14% in 2001/02 to 5.5% in 2004/5. This appears to follow a national trend. Over the same five year period, the number of students admitted ranged from 30-117, although the selectivity (percent admitted out of all that applied) has hovered around 50%.

Since the summer of 2004, IME has engaged in a number of recruitment activities. First, the Department developed a one-page flier describing the graduate programs and the department's commitment to making several assistantship offers to incoming M.S. and Ph.D. students. The flier was posted on the IME graduate program website and sent out by IME graduate faculty to their colleagues in the US and internationally, asking them to bring it to the attention of their students. We were told that this effort appears to have been rewarded by the receipt of more applications from "good to better quality students." Second, the IME Graduate Program Chair contacted faculty member from regional universities to arrange hour-long graduate student recruiting presentations. In all, four presentations were put together—one for each of the four focus areas in IME. At the time of the self-study, 5 presentations had been made at 3 universities in all four focus areas. At these presentations, students were given interest cards to return to the IME department for future recruitment. Finally, IME participated in The College of Engineering's graduate student recruitment event that took place in February 2005. A total of 6 prospective students who had expressed an interest in IME participated in that event.

The availability of teaching and research assistantships is also a valuable recruiting tool. IME is trying to make decisions about funding these assistantships earlier in the process so that students can consider them among competing offers. In addition, the current plan is that when a teaching assistantship is awarded, it is guaranteed for two quarters. After that, the hope is that students will get funded by a research assistantship in their focus area of interest.

Recommendation:

3. *The review committee acknowledges the increased recruitment efforts by the Department and recommends that they be continued.*

Quality and Retention of Students

In Spring 2005, there were a total of 38 graduate students in IME, and of them 26 were M.S. students. The ratio of men to women among the graduate students is roughly 3 to 1. In terms of ethnic diversity, the two most prominently represented groups are White (21 of 38) and Asian/Pacific Islander (15 of 38). Almost two thirds (24/38) of the graduate students are not US citizens. The Review Group was not given retention numbers. The department has delineated a number of steps to keep track of, and mentor, students who do not meet the requirements of a minimum of B in all courses.

Students are expected to earn a grade of B or better in each graduate course they take, and must maintain a term GPA and cumulative GPA of 3.0 or better during their academic career at OSU. Students who fall below these standards receive a warning letter from the Graduate Program Chair; if the student's performance does not improve, a second warning letter is issued. Continued sub-par performance warrants termination from the program.

Ph.D. students are required to take a preliminary examination after they have completed the majority of their coursework. The exam, which is designed to determine whether the student has the intelligence, motivation, and creativity necessary to complete the degree, tests student creativity and ability to synthesize material via individualized questions based on a preproposal of the dissertation research. The graduate students who met with the review team felt, uniformly, that the prelims were rigorous, fair, and extremely useful, as they were individually tailored to each student's research needs and interests.

Student Financial Support

Twenty-six of the 33 graduate students (79%) enrolled in 2005/05 received some assistantship. Of these, 12 were supported by a teaching assistantship, 12 by a research assistantship and 2 by fellowships. These assistantships are supported at between 0.40 and 0.45 FTE. Incoming students in Fall 2005 are supported on stipends ranging from \$1500 to \$1700 per month, with tuition waiver and insurance coverage (rates differ for M.S. and Ph.D.). These stipend amounts appear to be comparable to those in IME departments at comparator universities.

Students were critical about the policies for graduate teaching assistantships. Based on this feedback and discussions with the graduate program chair it would seem that the policies are a bit ad-hoc and might be improved with more structure and communication of the policy to graduate students.

Satisfaction with the Program

Interviews with current students, and surveys of current and exiting students, and alumni, were consistent in their praise of many aspects of the graduate program. Students and alumni generally expressed a satisfaction with the quality of teaching and advising, the hands-on preparation provided by the program, access and interactions with professors, and administration of preliminary examinations. There seems to be a genuine sense of community in the department.

Nonetheless, dissatisfaction was expressed by current students in four areas—(1) the number of 400/500 level course (the “slash” courses), (2) the lack of a research seminar series in which students can learn about applications outside of the department; (3) the awarding and availability of GTA/GRA appointments; and (4) communications. The department is actively working on a plan to reduce the number of slash courses—this is in keeping with the new Graduate School requirement that no more than 50% of course for a M.S. may be 400/500-level. The review committee had some recommendations for starting and maintaining a research seminar series—allowing it to be organized by the students, encouraging former students to return and share information about their current jobs, and asking current faculty to present their research. As for the awarding and availability of GTA/GRA appointments, we encourage the department to be as transparent as possible in these regards.

By far, the lowest marks in the survey of current students concern issues of departmental communication. By and large, respondents did not feel that department seminars are adequate to keep them “informed of developments in [the] field”; they did not feel that

the department informs them of “adequate opportunities for professional development . . . such as attendance at professional meetings”; and they did not feel that GTA assignments are “made equitably, based on established criteria.” The students who spoke with the review team echoed these sentiments.

In conversation with the review team, the Graduate Program Chair and the interim department head conceded that communication with students regarding procedural or departmental policy matters was usually “informal,” in large part because the department is small. The informality may reinforce student perceptions that departmental communication is not adequate or always transparent. The problem might be easily solved by establishing a departmental seminar series, perhaps organized by students working with faculty, and by establishing other formal mechanisms for student input into departmental policy. These recommendations are made elsewhere in this report.

3.2 Curriculum

IME offers courses in its four primary areas of graduate study: Human Systems Engineering, Information Systems Engineering, Manufacturing Systems Engineering and Nano/Micro Fabrication. One area of difficulty in the department is in the offering of graduate courses. From surveys and our discussions with students it is clear that students would like more courses offered at purely the graduate (500) level, but current staffing is inadequate to do this.

The department will clearly not be able to meet the new graduate school requirement regarding “slash” courses in 2005-06 due the loss of two faculty positions. We reiterate our earlier recommendation that the department be allowed to replace at least one position this academic year or the problem may persist longer. Additionally, with uncertainty about the transition of this program as part of the College restructuring, and with loss of faculty, it would appear that students find it difficult to plan their academic programs. A tentative listing of courses to be offered over a two-year horizon would assist students and faculty in planning. Additionally, IME should consider cross-listing courses with departments with common interests so that they can share the teaching burden.

There was also concern raised by students about the lack of a regular seminar series. Such a series would enable students to learn more about current research in the department and college, as well as hearing from visiting speakers from industry and elsewhere.

Recommendations:

4. To broaden the graduate curriculum, and alleviate some of the impact of faculty losses we recommend that IME consider cross-listing courses with departments with common interests. Opportunity would seem strongest with Statistics (operations research

for Manufacturing Systems majors) and Mechanical Engineering (material and materials processing for Nano/Micro Fabrication majors) although other relationships might also be built with Computer Science (Information Systems majors) and Exercise Science and Psychology (Human Systems majors). Developing these relationships would also satisfy the graduate students' desire for a broader range of courses.

5. IME should publish a list of courses that will be offered over a two-year horizon to enable students to better plan their programs.

6. We recommend the development of a graduate seminar series. It may be useful to create this as a course for credit, and require graduate students to attend. Such a series could include speakers from OSU, both from in IME and elsewhere, as well as speakers from industry. Academic speakers who require compensation for expenses could come from other universities in the region to minimize expenses, while those from farther away may be invited based on fiscal considerations. Possible sponsorship of the series by industry should also be investigated.

3.3 Faculty and Other Personnel

The quality of the faculty in IME has improved dramatically with the addition of good young faculty in the various specialties of the department. Each specialty of the program has two faculty. However, this number is insufficient to offer the graduate program to meet the new graduate policy on slash courses or to advise the proposed number of 50 graduate students (6.25 students/faculty with current faculty numbers).

The other personnel of IME include two staff assistants and two technical assistants, one for computer support and one for general laboratory support. This would appear to be appropriate for the size of faculty and graduate student body.

There currently appears to be a mismatch between faculty numbers and plans to expand the graduate population in IME. If it proves impossible to expand the faculty in the current circumstances, the Department will need to reconsider its future plans for the curriculum and student numbers.

Recommendation:

7. The Department, in association with College administration, should develop a flexible plan that matches graduate student numbers and teaching commitments to the number of faculty available.

3.4 Infrastructure:

The IME department has two dedicated office areas for graduate students, with space for a total of 22 cubicles for GTAs and research assistants. In addition, the department has eight on-campus laboratories, all housed in Covell Hall and the adjoining Batcheller Hall, and one facility (ONAMI) on the Hewlett-Packard campus:

- The IME Computer Laboratory, in three separate rooms, with over 60 computers for student use.
- The Human Factors/Ergonomics Laboratory, with an FAA-approved flight simulator and a laparoscopic surgical equipment simulator.
- The Computer-Integrated Systems Laboratory, with equipment that allows students to study the principles of sensors, pneumatics, and other automated industrial components.
- The Lean Automation Laboratory, designed to give students hands-on experience with electronic manufacturing.
- The Mobile Technology Solutions Laboratory, with more than \$500,000 in automatic identification and data collection equipment.
- The Electronic Vehicles Miles Traveled Revenue Collection System Project Laboratory, sponsored by the Oregon Department of Transportation for research into commercial fuel dispensers and mileage data collection.
- The Rapid Prototyping and Metrology Laboratory, used in support of research within microtechnology-based energy, chemical, and biological systems.
- The IME Machine Shop, which provides students with two engine lathes, three vertical drilling machines, a drill press, and other equipment and tools.
- The Oregon Nanoscience and Microtechnologies Institute (ONAMI) facility at Hewlett-Packard, specializing in customized prototyping, manufacturing and characterization equipment for creating devices with micro dimensions.

The laboratories are directed by the technical support staff or by individual faculty members working in the various research areas. The laboratories are well-aligned with the four areas of specialization in the Department, but there is scope for more integrative research across the laboratories and with other laboratories in the College and elsewhere. The faculty leadership teams appear to use the laboratories directly in their instruction and research. All seem proud of the work that the facilities let them accomplish. All laboratories seem to be continually refreshed with new or latest technology, whether computers, machine tools, equipment or NC/Robotics, but maintaining up-to-date laboratory equipment requires continuing efforts.

Currently, each on-campus laboratory is adequate or more than adequate for the department's needs, and serves the students well. The Lean Automation Laboratory is particularly state-of-the-art, having undergone an extensive renovation in the summer of 2002 during which an updated electronics manufacturing surface mount assembly was installed.

The ONAMI facility on the Hewlett-Packard campus is especially impressive. It is part of a unique collaboration involving OSU, Portland State University, and the University of Oregon, as well as the Pacific Northwest National Laboratory, the Oregon Graduate Institute, the Oregon Health and Sciences University School of Dentistry, and selected researchers from industry clusters throughout Oregon and Washington. ONAMI research leads the nation in microfabricated systems for miniaturization of energy, chemical, and biomedical/biological processes, as well as in high-temperature microstructures. The equipment is state-of-the-art and provides students with unparalleled opportunities for research and manufacturing application. The physical distance of ONAMI from the IME department carries with it the risk of isolation for those students and faculty based there.

Overall, the graduate student office accommodation, class rooms and laboratory infrastructure are adequate or even above average when benchmarked anecdotally to other universities. Overall, this infrastructure is a notable strength for IME, and could be used for further collaborations with other departments in the college, elsewhere at OSU, or externally.

Recommendations:

- 8. The Department should look into areas of research collaboration, which might be led by IME faculty or otherwise, that could take advantage of the excellent infrastructure in IME and lead to more research involving cross-disciplinary integration.*
- 9. The Department should consider mechanisms to avoid isolation of those working at ONAMI. These may involve improving transportation between ONAMI and campus, creating a student seminar series, and encouraging regular faculty interaction both professionally and socially.*

3.5 Organizational Issues

IME Department Personnel:

Dr. R. “Logen” Logendran, an Associate Professor with sixteen years experience in the IME department, serves as the Graduate Program Chair. He is responsible for planning student recruitment, overseeing graduate admissions, and monitoring students’ academic performances. In consultation with the department head, he appoints graduate teaching assistants (GTAs). GTAs and graduate research assistants are supported by grant income brought in by the IME faculty’s research projects. The department’s grant income has averaged approximately \$880,000 over the last three fiscal years. This money also helps support the purchase of computers and equipment, faculty time, and conference travel. The department aspires to support more graduate students, particularly at the Ph.D. level, but recognizes that this will require a larger faculty bringing in more research dollars.

An Office Specialist and a Business Manager within the IME department provide administrative support to the graduate program. The Office Specialist, who also serves as the Graduate Program Secretary, oversees correspondence with prospective students, the Graduate School, and the OSU Admissions Office, and compiles data regarding students' academic performance. The Business Manager is responsible for assistantship appointments.

Technical support is managed by two staff members in the IME department, one of whom maintains and upgrades faculty computers and computers in the department's various laboratories, while the other purchases lab machinery and equipment. Both staff members are assisted by students.

The administrative and technical support for the graduate program seems very effective and sympathetic to student issues. This undoubtedly contributes to the general level of satisfaction that the students expressed.

Restructuring plans in College of Engineering

The Review Group heard several times during the site visit, from Departmental faculty and graduate students, of concerns about the discussions that were under way to merge IME with Mechanical Engineering, thus forming a new School within the College.

This imminent reorganization places IME at a critical juncture, especially since similar mergers of mechanical and industrial engineering at other universities over the past two decades have resulted in quality decrements in industrial engineering. The College should endeavor to learn from these experiences of others. Although there are always challenges in reorganization, there can also be benefits. For example, in a merged department it might be possible to place more emphasis on research clusters and other collaborative programs. One of the major challenges will be to avoid losing the identity of the IME Department in any larger unit. In order to maintain quality in the graduate program we recommend the following be considered within any merger plan:

Recommendations:

- 10. In order to keep an identity for IME it should retain department or a similarly clearly defined status. This will be critical for the continued recruitment of highly qualified faculty and graduate students.*
- 11. Some budget lines of IME should be kept separate from Mechanical Engineering to avoid erosion of the smaller program.*
- 12. IME should be allowed to hire faculty to replace those that have departed. This is critical to meet the new Graduate School rules regarding graduate coursework and would be an important show of support for the program.*

4. PRODUCTIVITY

The Review Group considered the productivity of graduate students and faculty, and the quality of the scholarly community that they form.

4.1 Level and Quality of Student Performances:

As mentioned earlier, the number of students who have applied to the IME department's graduate programs declined from a high of 205 in 2001-02 to a low of 59 in 2004-05, and numbers admitted declined similarly. The department's Self-Study indicates that the graduate admissions committee has become more stringent in recent years, "admitting fewer but better quality students." It is difficult to judge whether this improved quality is, in fact, the case, or whether the smaller numbers simply reflect the overall decline in applications and student acceptances. While applications have generally increased throughout the College of Engineering, the numbers for the IME department have steadily decreased in the last three years. The Department should investigate whether this is part of a national trend, and should attempt to compare the quality of its intake with that in other comparator departments.

Other than a Graduate Alumni Survey distributed in May 2005, and a recent survey of current graduate students, the IME department only has anecdotal views of student performances. Faculty members agreed that weak students rarely make it as far as the preliminary examination, though they all recalled some students who failed the prelims the first time around. The Graduate Alumni Survey indicates that the majority of respondents (19 of 29) secured positions in business or industry after graduating from the IME department. Two more earned tenure-track faculty appointments at a college or university, and three others found work in government. Though the sample is too small to be considered anything other than anecdotal, it affirms the faculty's overall impressions that students who complete the department's graduate programs do rigorous, quality work, and leave OSU as highly attractive candidates for industry or academia.

We would have liked there to be more complete information about the quality of incoming students and the career progression of past graduates. We are surprised that more is not known about students leaving the Department, especially since continuing contact by the Department with its former students can be an important source of academic enrichment for both faculty and student currently enrolled in the program.

Recommendations:

13. The Department should keep records of the quality of students applying and being accepted into the program, and should endeavor to compare intake quality with that of comparator departments.

14. The Department should introduce an on-going plan to keep track of former students and their career progression.

4.2 Level and Quality of Faculty Performance

External research has averaged \$110,000/faculty-year over the last three years. Additional and substantial funding in nano/microfabrication has also been realized (some via ONAMI) but was not reported to us. The department's funding level is very good and competitive with top programs. The faculty performance in refereed publications is good in quantity and in the quality of journals.

The faculty is active professionally, publishing and presenting at conferences. Faculty also have numerous contributions of book chapters, particularly in materials processing. Three faculty serve as associate editors for four quality journals. All of these indicators are very good for faculty performance.

4.3 Quality of the Scholarly Community (including collaborative ventures).

The IME Department derives strength from being built around four main research (focus) areas—Manufacturing Systems Engineering, Nano/Microfabrication, Information Systems Engineering, and Human Systems Engineering. The review committee toured research laboratories for each of these focus areas, including the ONAMI center located on the Hewlett Packard campus in Corvallis. Many of these laboratories are equipped by industry partners or using funding from these partners. Details of the laboratories were given earlier. Each of the IME laboratories is used in both teaching and research, and we observed graduate research assistants at work in many of the laboratories.

There appears to be a real commitment among the IME faculty to the four focus areas, and there do not appear to be any tensions between faculty regarding the delineation of the focus areas and/or regarding the laboratory facilities. As a group, they seem to work together toward the common IME mission while at the same time pursuing research in their own focus areas. In addition, the faculty actively provide students with experience using state-of-the-art equipment and technology, both through classroom instruction and through graduate research assistantships. The collegial atmosphere among faculty and between faculty and students makes for a healthy and vibrant collaborative community within the Department.

Recommendation:

15. The Department should investigate further the possible causes of the decline in graduate applications in recent years. For example is this a national trend, or are there special factors at OSU that need to be remedied?

5. OUTCOMES

5.1 Professional Viability of Graduates:

Faculty believes that the Department maintains high placement rates of completed candidates in appropriate positions, but does not currently have quantitative data to support this.

The department should start tracking these data by area of specialization for PhD and Masters graduate. The Oregon industry view is that more candidates with advanced degrees are required, so there is a good alignment of goals between IME and industry. IME should make clear and aggressive goals for the number of PhD students that it plans to graduate over the next 5 years. The goals should be specific for areas of specialization.

In discussions with the Review Group the faculty felt there would be little or no interest in advance degree student internships in industry. On the other hand, students did show interest and believed that availability of internships could make IME more attractive than similar departments at other universities. Although faculty might be concerned of losing graduate students to industry during an internship, the Graduate Program should consider formalizing an internship program with industry and building mechanisms to encourage students to return for their degree (like with IME BS degrees).

5.2 Satisfaction Survey of Graduates:

Of the 29 students responding to the May 2005 Graduate Alumni Survey, 76% of respondents said they would recommend the graduate program to prospective students. 48% claimed to be “very prepared” for a career or further advanced degree after completing the graduate program, while 34% claimed to be “somewhat prepared.” Availability of resources for student research and diversity of course offerings received the lowest marks in the survey.

These responses accord with the attitudes of most current graduate students in the IME department. as evidenced by the recent survey as well as by the review team’s session with students.

5.3 Ranking of the Graduate Program

The Department did not comment in its self study on the ranking of the graduate program nationally. We believe that it should keep track of rankings (if possible) and endeavor to identify ways of improving its ranking

The IME Department at OSU is currently not ranked in US News & World Report’s top 40 graduate rankings (the extent of the specialty rankings). The department has clearly improved with the addition of good young faculty and laboratory facilities for graduate research (including ONAMI). Their self-study report also outlines areas for future

improvement including growing the graduate program, developing additional strictly graduate courses, pursuing funds via development, addition of new faculty, and development of a seminar series. These improvements are all needed.

Examining the USNWR Top 40, most of the programs are significantly larger than IME. Subjectively, the overall quality of the IME graduate program at OSU would seem to be equal to or even better than a number of ranked programs of similar size. The areas of improvement noted above, along with a more aggressive approach to national visibility, can help this program to be ranked in the Top 40 in future. Additional opportunities for visibility include:

- 1. Setting a specific goal for the proportion of doctoral students in the graduate program and seeking to place these students in academe.*
- 2. As aggressively as possible, invite top industrial and manufacturing engineering faculty regionally and from across the US for seminars. This has the dual benefit of better preparing graduate students and allowing others to meet the faculty and see the facilities, gaining increased visibility.*
- 3. Proactively work with colleagues at other universities to be invited to give seminars, thereby increasing visibility.*
- 4. Increase attendance and participation at key national professional society meetings.*

Recommendations:

16. The Department should consider developing a graduate internship program in collaboration with industry.

17. The Department should keep track of national rankings of graduate programs in IME departments and endeavor to use this knowledge to improve the ranking of IME at OSU.

18. Given the climate nationally (and particularly in Oregon) for the funding of higher education, it may be necessary to increase development efforts as noted in the self-study report. This is not a short-term process and requires proper cultivation of alumni and corporations. Efforts should be made to put together a strategic plan of how to accomplish this. Other than scholarship and assistantships, IME may also wish to consider an endowed seminar series and professorships to attract top faculty or support current faculty.

Departmental Response to Graduate Council Inquiry regarding Master's Degree in Interdisciplinary Studies

Contents:

- Original email request
- Summary of responses
- Recommendation from Director of MAIS Program
- Full Responses from Department Heads

Original Email: Request for Input on CAT I proposal to Add MSIS degree and Change the MAIS Degree

At Graduate Council meeting on February 2, the CATI MSIS/MAIS proposal was discussed. The vote was split on whether to approve the proposal as is. I was asked to solicit feedback from Department Heads across campus.

In the discussion following the vote, the consensus among the council was:

- They support an Interdisciplinary Studies Graduate degree
- They support eliminating the CLA requirement
- They support addition of 2 required courses

Their concerns were that there was not enough of a distinguishing difference between the MSIS and MAIS to launch a new degree. Currently, the MAIS degree does not have a language requirement. The language requirement for the MAIS degree was added in the CAT I proposal as the means to distinguish the difference between the MAIS and MSIS degree. MAIS would require language and the MSIS would not. This brings the degrees into consistency with other OSU MA and MS degrees.

Discussion among the council included possibilities (which assumed that the first three items that they had consensus on remained) such as

- Having one degree, calling it MIS (Master's of Interdisciplinary Studies) and not having a language requirement
- Having one degree, call it MAIS (as it is now) with no language requirement
- Having one degree, call it MAIS with a language requirement.

Please let me know which of these three possibilities you prefer and other input into this degree by **February 17** so that I can get your feedback to the Graduate Council. Your input will help them make the final decision.

I am attaching a copy of the CAT I proposal for your reference.

Summary of Responses

There were thirteen responses representing 6 colleges:

5.5 responses - one degree, calling it MIS (Master's of Interdisciplinary Studies) and not having a language requirement (COB, CHHS, COF, CLA, COS)

3 responses - one degree, call it MAIS (as it is now) with no language requirement (COS, CLA)

1 response – degree with a language requirement (ELI)

.5 response - one degree, call it MAIS (as it is now) with no language requirement (COS)

3 responses – no preference (CAS, CHHS)

Recommendation from Director of MAIS Program

Given the responses and the discussion in Graduate Council, the Director of the MAIS program recommends that the CAT I be revised to offer one Master's of Interdisciplinary Science (MIS) degree at OSU, that there not be a language requirement or a CLA course requirement, and two required courses be added as listed in the current CAT I proposal.

As a separate issue, the Graduate Council might consider the issue of a language requirement for an MA degree and an equivalent "science" requirement for the MS degree at OSU. Consider the respondents who favored this idea as potential committee members to explore this issue.

Full Responses

John Drexler COB: I prefer the MIS

Kate Lajtha – COS: I agree with either #1 or #2, and not #3.

1. Having one degree, calling it MIS (Master's of Interdisciplinary Studies) and not having a language requirement
2. Having one degree, call it MAIS (as it is now) with no language requirement
3. Having one degree, call it MAIS with a language requirement.

Leslie Burns, CHHS, Design and Human Environment: Although DHE fully supported the MSIS degree as it was proposed, since we now have just the three options, we would prefer the first, MIS (Master's of Interdisciplinary Studies). From our perspective the other 2 options do not make sense, given the work that has been done since the program review.

Bob Smythe (Statistics) COS: I would favor an MSIS or MIS degree not requiring a field in CLA and not requiring a language. I favor strengthening the degree by adding 4 IST credits and a suitable admissions review.

I'm passing on a comment from a colleague, Dave Birkes, who has the most experience of any of us with the MAIS:

"This might be a good time to change a confusing sentence that up to now has been included in the description of the MAIS requirements, and also appears in the proposed MAIS/MSIS requirements, which say:

" 'A minimum of 9 credits in each of any three fields of study is required...
No more than 21 credits may be taken in any one field unless the total program exceeds 49 credits. Thesis or research project credits do not count toward this 21-credit requirement.'

"I think this may be equivalent to saying:

" 'Aside from thesis or research project credits, the program must include at least 9 credits in each field of study. If exactly 9 credits are taken in one of the fields, then at least 11 credits must be taken in each of the other two fields (aside from thesis or research project credits).'

"The latter phrasing makes it easier, at least for me, to verify that a program meets the requirements."

I hope this comment is helpful.

Tom McLain COF: I had a department meeting recently and used the opportunity to pool my faculty. We have had the MAIS option for some time, but have never used it. There was some diversity of opinion, but in general the group :

--saw value in offering an IS option for interested students, (especially if CLA requirement is removed)

--doesn't see that they would encourage their students toward that degree especially with the dual major option being so much more attractive (almost all of our students are grant-funded), but could see that the IS degree could be useful in limited cases,

--saw no problem with 49 credits if those could be used to build a meaningful cohort (some skepticism here based on our experience in cohort building with dual majors)

--saw no need for two different degrees unless there could be a clear demarcation between MS and MA beyond the language requirement (some concern that demarcation wasn't already in place)

Sunil Khanna, Anthropology, CLA: (conversation summarized) Given the current situation, I favor an MIS degree with no language requirement and no CLA requirement.

Larry Flick, COS, Science and Math Ed: In my PhD program at Indiana University, you had an option of "tool skills", one was a year of foreign language and the other was advanced statistics.

I don't know if "tool skill" is the correct term but I favor the MAIS with a language requirement and an MSIS with its own requirement. I could imagine a parallel requirement in MSIS from the Department of History or the Department of Philosophy taking courses in history and/or philosophy of science.

Bill Lunch, CLA, Political Science: I would recommend an alternative I do not see among those you have listed (unless I mistake your intent, always a strong possibility) -- that is, to have a traditional language requirement, such as French, Japanese, Italian or whatever for the MAIS, and to have a quantitative "language" requirement for the MSIS. In that case, the students would be expected to take a certain number (perhaps three?) courses in the "language" of science, quantitative study, such as statistics, computer science, or math. Such a requirement would parallel the distinction we currently make for undergrads choosing between the Bachelor of Arts versus the Bachelor of Science degree.

Susan M. Shaw, Women Studies, CLA: I really do like the language requirement for an MAIS. I think it really does strengthen the degree tremendously. If that's the option, does that mean there will be no MSIS at all? I still support that idea with the addition of math/science requirements to further distinguish it from the MAIS.

Deborah Healey – English Language Institute: Personally, I think that everyone at OSU should have a language requirement - it's really the best way to become a globally-aware citizen, as well as to be more prepared to deal with our increasingly multilingual environment here in Oregon and the rest of the US. It would be a great shame to lose the requirement entirely.

Carolyn Aldwin, CHHS, HDFS: Thank you very much for seeking input on the proposal to add an MSIS degree and to change the MAIS degree. The graduate program in human development and family studies participates in the current MAIS degree only as a second or third area. Regardless of the outcome of this decision, we have no plans to change our level of participation.

We agree that HDFS is an appropriate support area for a number of primary areas offered on our campus. Our view is that those primary areas should have major input into this decision to change the master's interdisciplinary studies option. We are willing to cooperate with the Graduate Council's decision, whatever it may be, and to continue to participate in an MAIS and/or MSIS program as a support area.

Bill Krueger, CAS, Range: I have sent this out to the faculty for review. We have no preference since we rarely use the MAIS.

Greg Perry CAS AREC: AREC doesn't have strong feelings about whether there is one degree or two. We support eliminating the CLA requirement

~compiled by Ann C. Schaubert, Director of MAIS Program, February 17, 2006

GRADUATE COUNCIL MEETING

February 16, 2006

3:00pm, MU 212

Present: Koenig (chair), Filtz, Francis, Gitelman, Harter, McCandless, Proebsting, Rettig, Rockey, and Unsworth

Absent: Gupta, McLain, Tadepalli

1. IGERT Proposal Review

Oregon State University is allowed to submit only four proposals for the Integrative Graduate Education and Research Traineeship Program (IGERT). At the request of the Research Office, the Graduate Council reviewed six letters of intent to prepare proposals:

- Advanced Materials for Environmental Sustainability
- Computational Science: Data Simulation, Acquisition, and Visualization
- Fundamentals and Applications of Novel 3-Dimensional Imaging Techniques for Multi-Scale Characterization of Complex Heterogeneous Systems
- Integrated Bio-Inspired Energy Transport
- Integrated Synthesis, Analysis and Interpretation of Earth Structure and Dynamics Earthscope and Related Data Sets
- Waterborne Pathogens: Evolution, Ecology, and Environment

By majority vote, the Council identified four of the letters that ranked above the other two. At the request of the Council, Associate Dean Rettig submitted the following email to the Research Office:

From: Rettig, Bruce
Sent: Thursday, February 16, 2006 4:24 PM
To: Higginbotham, Jack
Cc: Delmore, Debbie; Koenig, Hal - COB; Francis, Sally K.
Subject: RE: NSF-IGERT proposals for review

Jack, the Graduate Council recommends that the following letters be developed into full proposals:

Advanced Materials for Environmental Sustainability
Fundamentals and Applications of Novel 3-Dimensional Imaging Techniques for Multi-Scale Characterization of Complex Heterogeneous Systems
Integrated Synthesis, Analysis and Interpretation of Earth Structure and Dynamics: Earthscope and Related Data Sets
Waterborne Pathogens: Evolution, Ecology, and Environment

Each of these proposals and the others that were not ranked in the top four have very interesting and promising features. The Graduate Council believed that any of them, with additional development, would represent Oregon State University well. We extend our hope for success in the national competition for these four and our regrets to the others who submitted proposals that Oregon State University is not allowed to submit more than four.

R. Bruce Rettig, Associate Dean
Oregon State University

GRADUATE COUNCIL MEETING

February 2, 2006

3:00pm, MU 212

Present: Koenig (chair), Filtz, Francis, Gitelman, Harter, McLain, McMullen, Proebsting, Rettig, Rockey, Tadepalli, and Unsworth

Absent: Gupta, McCandless

Guests: Bill Krueger & Dawn Eastlick, Ann Schauber

1. Category I Proposal to Rename Degrees in Rangeland Ecology and Management

Bill Krueger (Rangeland Ecology and Management) began by thanking the Council for reading the proposal and reminded the members that his department had changed its name from Rangeland Resources to Rangeland Ecology and Management last year. The Category I proposal brought forward today seeks to change the names of the BS, MS, PhD, degrees and the Rangeland minor to match the department's new name. Krueger informed the Council that the new name reflects current market and industry terminology and provides a more accurate description of the course of study for the department's students.

After being asked about the number of students in the programs and about what students think of the name change, Krueger told the Council that a student regularly attends the monthly departmental meetings and that others were consulted. Students are very supportive of the new name, and they feel the change is great.

Bruce Rettig (Graduate School) asked Krueger whether, if the proposal is approved, students would switch to the new degree name when given the opportunity, since current procedures allow students to keep the old name on their records if they so chose. Krueger responded that he believes that most students will switch to the new name.

A motion to accept the Category I proposal as submitted was moved and seconded. All voted in favor. Motion passed.

Krueger and Dawn Eastlick left the meeting.

2. Category I Proposal to Create a Master of Science in Interdisciplinary Studies and Modify the Master of Arts in Interdisciplinary Studies

Ann Schauber (Graduate School) began by informing the Council that her MAIS advisory committee had originally supported the drafting of an abbreviated Category I proposal, which would create the MSIS degree and introduce changes to the MAIS, but later learned that a full Category I proposal would be needed to make these changes.

Schauber presented a quick overview of the proposed changes to the MAIS and described the structure of the new MSIS. She told the committee that all of the proposed changes address recommendations made by the 2002 Graduate Council program review panel.

Extensive discussion ensued.

The consensus among the Council was:

1. They support an Interdisciplinary Studies Graduate degree
2. They support eliminating the MAIS' CLA requirement
3. They support the addition of 2 required courses to the MAIS

Council members were concerned, however, that there was not enough of a distinguishing difference between the MSIS and MAIS to warrant a new degree.

Additionally there was discussion concerning foreign language requirements, in general for all OSU MA programs, and specifically regarding the proposed change to the MAIS. Schauber argued that currently, the MAIS degree does not have a language requirement. The language requirement for the MAIS degree was added in the CAT I proposal as the means to distinguish the difference between the MAIS and MSIS degree. MAIS would require language and the MSIS would not. She added that the change brings the degrees into alignment with other OSU MA and MS degrees.

A motion to accept the Category I proposal as submitted was moved and seconded. The voting members of the Council were evenly divided, which led the Council to explore the sources of difference and to identify the best way to proceed.

The Council developed three alternatives to address the concerns expressed in the discussion before the vote took place:

- Having one degree, calling it MIS (Master's of Interdisciplinary Studies) and not having a language requirement
- Having one degree, calling it MAIS with no language requirement (status quo)
- Having one degree, calling it MAIS with a language requirement.

Schauber was asked to solicit feedback regarding the changes suggested above from Department Heads across campus and to report her findings at a subsequent Graduate Council meeting.

The meeting adjourned at 4:30 pm.

OREGON STATE
UNIVERSITY

Category I Proposal Transmittal Sheet

Submit proposals to: Office of Academic Programs
110 Kerr Admin -- Oregon State University

For instructions, see <http://oregonstate.edu/dept/academic/cph1998/>. Please attach Proposal, Library Evaluation (performed by the library), Liaison Correspondence, Faculty Curriculum Vitae, and Budget Sheets, as appropriate.

Check one:

Full Proposal

- ☐ New degree program
- ☐ New certificate program or administrative unit
- ☐ Major change in existing program
- ☐ Establishment of a new College or Department

Abbreviated Proposal

- ☒ Rename of an academic program or unit
- ☐ Reorganization -- moving responsibility for an academic program from one unit to another
- ☐ Merging or splitting an academic unit
- ☐ Termination of an academic program or unit
- ☐ Suspension or reactivation an academic program or unit

For proposals to establish a new center or institute, contact the Research Office (737-3437).

For requests to offer existing certificate and degree programs at new locations, use the New Location Request Form available on the Web: <http://www.ous.edu/aca/aca-forms.html>

Proposal Title: The Rangeland Resources Degree Name Change
Type of Proposal: Degree(s) Name Change
Institution: Oregon State University
College: College of Agricultural Sciences
Department/Program: Department of Rangeland Ecology and Management
CIP (*Classification of Instructional Program number*): 01.1106
Date of Proposal: 12/12/05
Proposed Effective Date/Term: Fall 2006

1. Title of the proposed instructional, research, or public service unit. For name changes, give both the current and proposed names. Describe the reason(s) for the proposed change.

This proposal seeks to change the name of the B.S., M.S., Ph.D., M.Agr., and M.A.I.S. degrees and the minor in Rangeland Resources, to Rangeland Ecology and Management. This title reflects current market and industry terminology and provides a more accurate description of the course of study for our students and future employment opportunities for our graduates. This change will also align our degree titles with our new departmental name.

2. Location within the institution's organizational structure. Include "before" and "after" organizational charts (show reporting lines all the way up to the Provost).

The location within the institutions organization structure will not change. Current organizational chart is included.

It should be noted the degree program hosted through Eastern Oregon University is a part of our department; their budget is a portion of the Corvallis campus Department budget and their staff is housed within our Department. Therefore, the degree name change here will also extend to those degrees earned through Eastern Oregon University.

3. Objectives, functions (e.g., instruction, research, public service), and activities of the proposed unit.

The program's current objectives, functions, activities, course offerings, program requirements, student learning outcomes and experiences, advising structure and availability will all remain the same. The new name, however, will provide a more accurate reflection of the activities and content of our degree programs.

a. **Resources needed, if any: personnel, FTE academic, FTE classified, facilities and equipment.** Identify the staffing and resource needs for the proposed program or unit. Note any impact on the budgets of affected programs or units. Provide an analysis of how the resulting programs or units will be adequately staffed and funded. Explain the extent to which affected faculty and personnel support this change.

Staffing and resource needs will not change from our current status. The faculty and personnel of the department have supported the name change unanimously via discussion and vote in the faculty staff meeting.

4. **Funding sources: state sources (institutional funds - state general fund, tuition and fees, indirect cost recoveries), federal funds, other funds as specified.**

N/A

5. **Relationship of the proposed unit to the institutional mission.**

a. How will the proposed program or unit support OSU's mission and goals?
b. Describe potential positive and negative impact of the proposed change on the program(s) or unit(s) involved. Identify other OSU programs or units which may be affected, and describe the potential positive and negative impact on their mission and activities.

a. N/A

b. We do not anticipate a negative impact resulting from these name changes. Conversely, we feel that these changes will give prospective students a better understanding of their course of study and future employment opportunities. We feel this clarification will increase the visibility and attractiveness of our degree programs.

6. **Long-range goals and plans for the unit (including a statement as to anticipated funding sources for any projected growth in funding needs).**

N/A as it relates to change of the degree name.

7. **Relationship of the proposed unit to programs at other institutions in the state.**

a. What is the current relationship of the proposed program or unit to OUS and other higher education institutions in the state? Describe how this relationship might be altered based on the proposed change.

b. Describe how the proposed change will affect other constituencies outside of OUS.

NA

8. **If the program is professionally accredited, identify the accrediting body and discuss how the proposed change may affect accreditation.**

The program has been and will continue to be accredited by the Society for Range Management. The name change will have no affect on accreditation.

IMPACT ON CURRENT STUDENTS:

There will be no negative impact to students; current students will be reasonably accommodated. Specifically, students who are enrolled in these programs at the time the name change is approved will be able to choose either the current name or the new name for their degree.

(OUS and OSU)

Category I Proposal Budget Outline

Estimated Costs and Sources of Funds for the Proposed Program

Total new resources required to handle the increased workload, if any. If no new resources are required, the budgetary impact should be reported as zero.

See "Budget Outline Instructions" on the OUS Forms and Guidelines Web site: www.ous.edu/aca/aca-forms.html

Change Proposal
Roy and Bill

With your approval I will circulate the following with attachments to the same list of Unit Heads that reviewed the Departmental Name Change.

Let me know if I can move ahead.

In keeping with the departmental name change to The Department of Rangeland Ecology and Management we are proposing a change to our B.S., M.S., Ph.D., M.Agr., and M.A.I.S. degrees from Rangeland Resources to Rangeland Ecology and Management to be effective Fall term 2006. The Category I (abbreviated) proposal is attached. Please review this proposal and comment or let me know if you have questions or concerns by December 09, 2005. (or one week from email date)

Non-response will be considered support. Thank you for your review of this proposal.

NOTICE: This E-mail (including attachments) is covered by the Electronic Communications Privacy Act, 18 U.S.C. 2510-2521, is confidential and may be privileged. If you are not the intended recipient, please be aware that any retention, dissemination, distribution, or copying of this communication is prohibited. Please reply to the sender that you have received the message error, then delete it. Thank you for helping to maintain privacy.

OSU Foundation, Inc.

Proposal for the Addition of a New Interdisciplinary Program Leading to the MSIS (adds to existing MAIS) And Revision of MAIS Degree

Oregon State University
Graduate School

Description of Proposed Program

1. Program Overview

- a. CIP number – 30.9999
- b. Brief Overview
This Category I proposal is designed to implement the following 2002 Graduate Council Program Review recommendations that were made by an external reviewer and a self-study committee of the MAIS degree program:
 - create new interdisciplinary degree, the Master of Science in Interdisciplinary Studies (MSIS) and thus add a language requirement to the MAIS degree to differentiate the two degrees;
 - eliminate the requirement that one of the fields of study for the MAIS degree be from the College of Liberal Arts;
 - add two required courses in interdisciplinary studies to the MAIS and MSIS degree requirements to make the total number of required credits to be 49.
- c. When will the program be operational, if approved? Fall 06

2. Purpose and Relationship of Proposed Program to the Institution's Mission and Strategic Plan

a. Background on the current MAIS Degree

The MAIS degree, emerging out of the M.A. in General Studies, came into existence at OSU in 1973. The MAIS degree is granted for attainment of broad, advanced knowledge integrated from three fields of study. The current degree requirements, in place since 1986, are:

- Any graduate major or minor may be used as one of three required fields for the MAIS degree;
- Two of the three fields may be from one department if the areas of concentration within these two fields are different;
- Currently, there is no foreign language requirement;
- No more than 21 credits (excluding thesis or research project credits) may be taken in any field unless the total program exceeds 45 credits;
- No more than 3 credit hours of blanket-number courses in each field of study may be used in the program (exempting thesis or research project credits)

The 2002 MAIS Self Study Report says that 399 MAIS degrees were awarded from 1991 to 2000 with 39 different graduate programs participating as fields of study. The predominant fields of study come from liberal arts with anthropology, speech communication, history, art, sociology, women's studies, and economics among the top. There have also been MAIS students with fields of study in forestry, computer science, education, health and human development, business, agriculture, and

geology. In most recent years, ethnic studies has become a popular field of study.

Graduates are employed by school districts, local and state agencies, non-profit organizations, Bureau of Land Management, and the U.S. Forest Service among others. Graduates also go on to complete a doctorate. Positions held by MAIS graduates include anthropologist, archeologist, author, journalist, lawyer, librarian, community college teacher, K-12 teacher, museum curator, newspaper editor, sociologist, and watershed coordinator.

b. What are the objectives of the program?

We are proposing to add an MSIS degree and make two changes to the MAIS degree to distinguish the difference between the two degrees.

The first change is that the MAIS degree will no longer require one field of study from the College of Liberal Arts. Both the Master of Arts in Interdisciplinary Studies (MAIS) and the Master of Science in Interdisciplinary Studies (MSIS) will allow students to put together and integrate a course of study based on any three fields of study and not be limited by the requirement to have one field from the College of Liberal Arts.

This proposal also changes the MAIS degree to be similar to other OSU MA degrees by requiring that the MAIS have a language requirement and the MSIS not have a language requirement. The MAIS degree does not currently have a language requirement. (MS and MA degrees at Oregon State University are differentiated by a language requirement. MA degrees include a 2 year college proficiency in a foreign language, while the MS degrees do not).

Otherwise, the course of study for the MSIS will be the same as for the MAIS degree. Students will choose three fields of study, have a faculty graduate committee member from each of these three fields to guide the course of study, and integrate these three fields into discovery of something new to address the student's scholarly inquiry. A field of study is defined as having it's own methods, tools, concepts, and theories which serve as shaping a particular world view.

Setting the course of study based on any three fields of interest diverges slightly from the 2002 recommendations of the Graduate Council in the MAIS program review process. The Graduate Council recommendation said that the three areas of study were to come from three different *departments*. The intention of this recommendation was to ensure that the degree was truly an interdisciplinary degree and not to provide an opportunity for students to get a graduate degree in a field in which OSU does not currently offer a graduate degree. The current proposal supports three fields of study as opposed to three different departments for two major reasons: (1) Current literature on interdisciplinary studies articulates fields of study rather than departments as the components of an interdisciplinary degree. We define field of study in the paragraph above. (2) The MAIS Steering Committee has initiated checks and balances with the MAIS program so as to ensure that the degree is truly interdisciplinary. These checks and balances include student advising (pre and post admission) from the Director of the MAIS program (new in 2004), an admissions screening committee to determine the readiness of the student to do interdisciplinary work, and two new interdisciplinary courses to be required of all students (see Section 3b below). The interdisciplinary nature of the degree will be determined by the interest, question, or professional goal with which the student comes into the MAIS program.

- c. How does the proposed program support the mission and strategic plan of the institution(s)? How does the program contribute to attaining long-term goals and directions of the institution and program?

This proposal supports the OSU 07 Strategic Plan which emphasizes thematic areas. The MSIS program will open up options for students to work within thematic areas from an interdisciplinary perspective, drawing upon the disciplines which most apply to the student's proposed course of study and interdisciplinary problem that can not be addressed from the perspective of a single discipline.

- d. How does the proposed program meet the needs of Oregon and enhance the state's capacity to respond effectively to social, economic, and environmental challenges and opportunities?

Social, economic, and environmental challenges and opportunities often require integrated thinking from many disciplines. Indeed, the interested student begins her/his inquiry into the MAIS/MSIS program with a societal, economic, or environmental issue or question through which he/she then seeks out faculty from the student's areas of interest to work with her/him in putting together the proposed program of study. The program graduate committee, which includes a minimum of three graduate faculty members from three different fields of study, works with the student to integrate his/her program of study into a cohesive unit.

The MAIS/MSIS program appeals to students who have a particular passion which often comes out of Oregon's social, economic, and environmental challenges and opportunities. For example, one current MAIS student is working on creating a theatrical movement curriculum to be used in long term care facilities in Oregon as her research project. In combining the fields of gerontology, theatre, and interpersonal communication, she is creating a series of CD's which will be used in care facilities to improve the mental and physical health of residents. Another current student is combining biochemistry, history of science, and public health. His research project focuses on a particular disease, combining insights gathered in relation to the disease's history, chemical makeup, and relation to the public's health and well-being. This work will be of value to him as he enters medical school in the fall. In essence, the MAIS/MSIS programs prepare students to explore a personal interest and graduate prepared to make a contribution to the state's social, economic, and environmental opportunities.

3. Course of Study

- a. Briefly describe proposed curriculum. (List is fine.)

In common with the Master of Arts in Interdisciplinary Studies (MAIS) degree, a minimum of 45 credits of graduate level work beyond the baccalaureate is required for the Master of Science in Interdisciplinary Studies (MSIS). However, two new courses are proposed (section 3 b.) to add four credits to this degree. Thus, both the MAIS and the MSIS will require 49 credits for completion.

A minimum of 9 credits in each of any three fields of study is required. A field of study contains its own theories, methods, tools, and concepts. No more than 21

credits may be taken in any one field unless the total program exceeds 49 credits. Thesis or research project credits do not count toward this 21-credit requirement.

No more than 3 credits of blanket-numbered courses in each field may be placed on the program except for thesis (Option A) or project (Option B) credits. There is no foreign language requirement for the MSIS, but there is a foreign language requirement for the MAIS. For the MAIS degree, the student must show foreign language proficiency equivalent to that attained at the end of a second-year university course in that language with a grade of "C" (2.00) or better. English is not considered a foreign language for purposes of this requirement. The foreign language requirement for the MAIS degree must be completed before the student takes the final oral examination for the degree. A minimum of 30 credits must be taken as resident credit through Oregon State University. A final oral examination covering the thesis or project, which integrates the three fields of study, and course work is required.

MAIS students meet the foreign language requirement in one of four ways:

- Complete second year university level sequence of language with an average grade of C or better;
- Pass the Foreign Language Achievement Test through Brigham Young University.
- Complete the equivalent of a U.S. high school diploma or U.S. baccalaureate degree where a language other than English was the medium of instruction.
- Pass placement exam given by Department of Foreign Languages and Literatures at OSU demonstrating language proficiency equivalent to that attained at the end of a second-year university course with a grade of C or better.

- b. Describe new courses. Include proposed course numbers, titles, credit hours, and **course descriptions**.

Two new courses, currently in development, (draft syllabi attached) will be proposed and will be required for both MAIS and MSIS students. A one credit course will be taken in the first year of study and a three credit course after a student has completed some course work in each of his/her three fields of study:

***IST 511: Introduction to Interdisciplinary Graduate Studies* – 1 credit**

This first term graduate course is designed to support the student in understanding and navigating the interdisciplinary graduate study process. The course will introduce the methods of interdisciplinary study which include dialogue, process, inquiry, transformation, interaction, construction, and negotiation. The course will be offered every term since new students arrive each term.

***IST 512: Applying an Interdisciplinary Perspective* – 3 credits**

In a highly interactive setting, students will define interdisciplinarity as it relates to their areas of study and analyze other interdisciplinary projects with the intent of gaining clarity about their own thesis or project, resulting in their own research proposal. Institutional Review Board policies and procedures as well as project funding will also be explored.

- c. Provide a discussion of any nontraditional learning modes to be utilized in the new courses, including, but not limited to: (1) the role of technology, and (2) the use of career development activities such as practica or internships.

The degree itself may be considered to be somewhat nontraditional in that it requires the student interested in the MSIS degree to apply for admission with a societal problem or career interest in mind that requires the integration of two or more fields of study to fully address the issue or problem. Thus, the student enters with a freedom to choose across the OSU curriculum to select the three fields that will best address his/her learning objectives. In some cases, a practicum or internship may be part of the course of study. On-line learning is used where it is available and applicable to the student's academic needs.

- d. What specific learning outcomes will be achieved by students who complete this course of study?

The learning outcomes include:

- Ability to articulate a researchable question that requires the integration of 3 fields of study and cannot be addressed from a single, disciplinary perspective;
- Evidence of ability to integrate three fields of study in relation to an interdisciplinary problem or issue;
- Generation of a final, culminating project or thesis that makes measurable progress toward understanding of the interdisciplinary issue or problem identified by the student;
- Mastery of subject matter in 3 fields of study sufficient to support the scholarly study of an interdisciplinary issue or problem;
- For MAIS students, a foreign language proficiency equivalent to that attained at the end of a second-year university course with a grade of "C" (2.00) or better.

4. Recruitment and Admission Requirements

- a. Is the proposed program intended primarily to provide another program option to students who are already being attracted to the institution, or is it anticipated that the proposed program will draw students who would not otherwise come to the institution?

This program is intended to provide options to some students who have already been attracted to the institution. Some prospective students who have expressed interest in the MAIS program decline to apply when they learn that one of the fields of study must be from the College of Liberal Arts. Students have interdisciplinary interests that sometimes do not include an area of study within the College of Liberal Arts.

In the past, the MAIS program has been perceived by some as being a way for a few students who do not succeed in a particular discipline to change to the MAIS degree as a means of attaining a graduate degree. The MAIS advisory committee has worked to address this concern by putting in place a more rigorous admissions review to be sure that the student is ready to do interdisciplinary work, by more carefully advising students who are interested in changing their degree to the MAIS degree, and by development of two required courses which will prepare the student to do integrative work.

- b. Are any requirements for admission to the program being proposed that are in **addition** to admission to the institution? If so, what are they?

There will be an MAIS/MSIS admissions screening committee which will review the student essay to ensure that the student is ready to do interdisciplinary work.

- c. Will any enrollment limitation be imposed? If so, please indicate the specific limitation and its rationale. How will students be selected if there are enrollment limitations?

Individual faculty members will determine enrollment limitations. Students will only be admitted when faculty members from each of the three fields of study have agreed to work with the student. This will be processed through the current Departmental Action Form (DAF).

5. Accreditation of the Program

- a. If applicable, identify any accrediting body or professional society that has established standards in the area in which the proposed program lies.

There are no accrediting bodies or professional societies.

- b. If applicable, does the proposed program meet professional accreditation standards? If it does not, in what particular area(s) does it appear to be deficient? What steps would be required to qualify the program for accreditation? By what date is it anticipated that the program will be fully accredited?

NA

- c. If the proposed program is a graduate program in which the institution offers an undergraduate program, is the undergraduate program accredited? If not, what would be required to qualify it for accreditation? If accreditation is a goal, what steps are being taken to achieve accreditation?

Accreditation is not a goal.

Need

6. Evidence of Need

- a. What evidence does the institution have of need for the program? Please be explicit. (Needs assessment information may be presented in the form of survey data; summaries of focus groups or interviews; documented requests for the program from students, faculty, external constituents, etc.)

The MAIS program underwent a Graduate Council Program Review in the spring of 2002. This review included a self-study report and an external review. One of the recommendations for strengthening the Master of Arts of Interdisciplinary Studies (MAIS) degree was to add an MSIS degree option.

- b. Identify statewide and institutional service-area employment needs the proposed program would assist in filling. Is there evidence of regional or national need for additional qualified individuals such as the proposed program would produce? If yes, please specify.

The MSIS degree will prepare students to address complex issues that require an integrative approach to problem-solving. Many public and private employers are in need of employees who can address complex societal issues from a broad based perspective.

- c. What are the numbers and characteristics of students to be served? What is the estimated number of graduates of the proposed program over the next five years? On what information are these projections based?

Currently, there are approximately 80 students enrolled in the MAIS program. We anticipate that the MSIS degree will add approximately 5 to 10 new students per year. The numbers are flexible and will vary depending on the faculty available to work with an MSIS student. The students who apply are generally interested in an interdisciplinary approach to learning and scholarship with a more flexible opportunity to address a passion or interest from a broad holistic perspective.

- d. Are there any other compelling reasons for offering the program?

The MSIS degree will be a complement to the MAIS degree and should have been implemented along with the MAIS when it was approved initially. Further, this proposal specifically addresses a recent program review report.

- e. Identify any special interest in the program on the part of local or state groups (e.g., business, industry, agriculture, professional groups).

There is none.

- f. Discuss considerations given to making the complete program available for part-time, evening, weekend, and/or place bound students.

This program will be dependent on the availability of current course offerings in the students' three chosen fields of study.

Outcomes

7. Program Evaluation

- a. How will the institution determine the extent to which the academic program meets the objectives (section 2a) previously outlined? (Identify specific post-approval monitoring procedures and outcome indicators to be used.)

The objectives previously outlined in Section 2a and how we propose to determine the extent to which the objects are met are:

Objective 1: Students will be able to put together a master's program from three fields of study at Oregon State University. We will determine that this objective is met by reporting the number of students applying, accepted, and completing the MSIS program over a five-year period. We will also report the variability of the three fields that students choose as well as a summary of project and thesis topics completed.

Objective 2: Students will integrate a minimum of two of the three fields of study into discovery of something new. We will use student evaluations of the IST 511 and IST 512 courses to determine how well students learn how to integrate fields of study.

We will use the student's final oral exam to determine the extent to which student's have integrated their fields of study.

Objective 3: MAIS students will demonstrate a foreign language proficiency comparable to other master's degree students at OSU. Student transcripts will show completion of required language classes or they will show successful completion of this requirement through a testing out of the classes.

- b. How will the collected information be used to improve teaching and programs to enhance student learning?

The information collected will be taken to the MAIS/MSIS Advisory Committee to be used for dialogue around implementing continuous improvements to the program. The Advisory Committee consists of representative college and departmental faculty who have worked with MAIS students.

8. Assessment of Student Learning

- a. What methods will be used to assess student learning? How will student learning assessment be embedded in the curriculum?

Students will meet with their graduate committee members to discuss their learning. The mid-program course: IST 512 Applying an Interdisciplinary Perspective (see Section 3 - Course of Study) will include dialogue around integration of student learning. The final learning outcome will be measured by the completed thesis or project.

- b. What specific methods or approaches will be used to assess graduate (completer) outcomes?

Graduate outcomes will be assessed in the final oral exam with the student's graduate committee.

- c. Is a licensure examination associated with this field of study?

No

Integration of Efforts

9. Similar Programs in the State

- a. List all other closely related OUS programs.
Portland State University offers
Interdisciplinary Studies: MA, MS
Systems Science: PhD, MS

University of Oregon offers

Interdisciplinary Studies: Individualized Program, MA

- b. In what way, if any, will resources of other institutions (another OUS institution or institutions, community college, and/or private college/university) be shared in the proposed program? How will the program be complementary to, or cooperate with, an existing program or programs?

This degree program is one that is typically offered by most universities as an option for students. Some universities also offer an interdisciplinary doctoral degree.

- c. Is there any projected impact on other institutions in terms of student enrollment and/or faculty workload?

No, there is no impact anticipated.

Resources

10. Faculty

- a. Identify program faculty, briefly describing each faculty member's expertise/specialization. Separate regular core faculty from faculty from other departments and adjuncts. Collect current vitae for all faculty, to be made available to reviewers upon request.

All faculty members who are approved Graduate Faculty members are eligible to participate in the MSIS program. The Graduate School maintains files on all Graduate Faculty. There will be no regular core faculty established at this time. However, the design of the new IST courses includes a method to build the interdisciplinary skills of faculty who are currently working with MSIS/MAIS students through involving the faculty along with the students in class dialogues and rotating one or two new faculty team members into teaching the class over time. Since there will be no core faculty initially, we will make all Graduate Faculty records available to reviewers upon request.

- b. Estimate the number, rank, and background of new faculty members who would need to be added to initiate the proposed program in each of the first four years of the proposed program's operation (assuming the program develops as anticipated). What commitment does the institution make to meeting these needs?

No new faculty are needed at this time.

- c. Estimate the number and type of support staff needed in each of the first four years of the program.

No additional support staff will be added.

11. Reference Sources

- a. Describe the adequacy of student and faculty access to library and department resources (including, but not limited to, printed media, electronically published materials, videotapes, motion pictures, CD-ROM and online databases, and sound files) that are relevant to the proposed program (e.g., if there is a recommended list of materials issued by the American Library Association or some other responsible group, indicate to what extent access to such holdings meets the requirements of the recommended list).

Library and department resources will remain the same that currently exist within each field of study at OSU.

- b. How much, if any, additional financial support will be required to bring access to such reference materials to an appropriate level?

How does the institution plan to acquire these needed resources?

We will use current Interdisciplinary Allocation Model (IAM) resources to develop new forms, brochures, revise the web site, and support initial instructional costs of the two required courses. The IAM provides resources to directly support the MAIS and, pending approval, the MSIS degrees.

12. Facilities, Equipment, and Technology

- a. What unique resources (in terms of buildings, laboratories, computer hardware/software, Internet or other online access, distributed-education capability, special equipment, and/or other materials) are necessary to the offering of a quality program in the field?

Since this is an interdisciplinary program that relies on existing resources, nothing new is required.

- b. What resources for facilities, equipment, and technology, beyond those now on hand, are necessary to offer this program? Be specific. How does the institution propose that these additional resources will be provided?

There are none.

13.If this is a graduate program, please suggest three to six potential external reviewers.

In the Graduate Council Program Review process of 2002, the MAIS program was reviewed with an external member participating in the process. The intention of the current Category I proposal is to implement the recommendations that resulted from the Program Review of 2002. We request waiver of an external review.

14. Budgetary Impact

- a. On the "Budget Outline" sheet (available on the Forms and Guidelines Web site), please indicate the estimated cost of the program for the first four years of its operation (one page for each year). The "Budget Outline Instructions" form for filling out the Budget Outline is available on the Forms and Guidelines Web site, as well.

See attached budget.

The budget includes faculty, staff, and supply costs to manage the two programs as well as instructional costs to offer the two courses once a year.

- b. If federal or other grant funds are required to launch the program, describe the status of the grant application process and the likelihood of receiving such funding. What does the institution propose to do with the program upon termination of the grant(s)?

NA

- b. If the program will be implemented in such a way as to have little or minimal budgetary impact, please provide a narrative that outlines how resources are being allocated/reallocated in order that the resource demands of the new program are being met. For example, describe what new activities will cost and whether they will be financed or staffed by shifting of assignments within the budgetary unit or reallocation of resources within the institution. Specifically state which resources will be moved and how this will affect those programs losing resources. Will the allocation of going-level budget funds in support of the program have an adverse impact on any other institutional programs? If so, which program(s) and in what ways?

The MSIS will be another interdisciplinary graduate degree option along side the MAIS degree program. The current Director of Interdisciplinary Graduate Studies will take lead responsibility for implementing the new degree program by internally reallocating current resources in the Interdisciplinary Allocation Model. This will include updating the website and getting information out to faculty and prospective students as well as working with the Admissions Office to make minor modifications to graduate admissions forms. Current support staff will aid in implementing and monitoring this program. Strategic Investment dollars from the Interdisciplinary Allocation Model will be requested for use as start up money to launch the two new proposed courses. Revenue generated by the two IST courses will be used to help continue funding of the course.

Subject: RE: Cat. I MAIS

Paul,
Thank you for your feedback on our Category I proposal to add an MSIS and modify the MAIS program. I wanted to respond to your concerns.

We agree that many disciplines have interdisciplinary aspects. We understand your concern that two required courses for the MSIS and MAIS program may appear to be too general. We are, however, designing the two courses to be specific to each student's chosen course of study.

Our understanding is that many graduate programs have a course which introduces the student to graduate studies at OSU. Most current MAIS students do not have an opportunity to take such a course. In my advising of MAIS students, I am finding many of them lacking the basic understanding of the graduate study process and eager to find other graduate students who are also doing interdisciplinary work. The one credit first term IST 511 course is designed to meet these two needs.

The IST 512 course is intended for students to develop their full proposal for their thesis or research project. This course is currently designed to include the student's major professor along with the student in their proposal development. Thus, our intention is to deliver a course which meets each student's individual needs.

Thanks for your attention to our Category I proposal,
Ann Schauber

Subject: Cat. I MAIS

Thanks for sending the MAIS and MSIS cat. I document. I think making the split makes sense. My only reservation is the requirement of two core courses on interdisciplinary studies. I think that graduate work tends to be fairly specialized and that many of the so called "disciplines" are quite interdisciplinary. I think that two courses that are designed to be for everyone is likely to be little value to anyone because it will have to be done in a very general fashion. I am unconvinced that there is a subject, "interdisciplinary" studies that is coherent. The student would be better off working with an advisor to craft a program that makes sense and make it tailored to fit the student's interests and needs. Paul Farber

Hi Susan,

I wanted to respond to your concerns about our Category I proposal.

The reason that we have a language requirement for the MAIS students and not for MSIS students is simply to bring the MAIS/MSIS degrees into alignment with all other MA/MS degrees at OSU. It is up to the student to decide if he/she wants an MAIS or an MSIS degree.

Thanks for your feedback on the Category I proposal,

Subject: RE: Curriculum liaison for adding and MSIS degree

Hi, Ann. Thanks for all your hard work on this. I may have read it too fast--but is it up to the major department to decide whether it will accept students as MAIS or MSIS? As I mentioned before in our meetings, I'm worried about students opting for the MSIS to avoid the language requirement. So I'm wondering, then, for example, could the English Dept. say any student doing a primary area in English must do an MAIS? I just can't imagine allowing a student to do, for example, an MSIS in English, Philosophy, and Music. Or if a student wants to do an MSIS in Women Studies, can we require that student to do more statistics classes than an MAIS student?

Thanks.

Ann,

The proposed additions/revisions to the MAIS to include the MSIS can only serve to strengthen their program. I think both tracks of the MAIS/MSSIS will suit students who intend to start our program.

Thank you,
 Larry

Cc: Schauber, Ann
Subject: RE: Curriculum liaison for adding and MSIS degree

Dear Leslie,

Thank you for your feedback about the MAIS/MSIS CAT I proposal. The following is my response to your concerns.

The Interdisciplinary Allocation Budget administered by the graduate school for the last year addresses this "inequity" in headcount. Hopefully, this will open up the possibility for MAIS/MSIS students to consider a field of study from your department.

In regard to admission standards to qualify for the MAIS/MSIS program, our MAIS/MSIS admissions screening committee will be developing criteria as their first business item once the committee is formed.

We agree that "mastery" in a field is rarely possible within 45 credits. We see the "mastery" occurring withing the "narrowed focus" of the student's research project or thesis. This narrowed focus will incorporate relevant portions of the body of knowledge which resides in three fields of study. For example, one student is studying the use of theatre arts to increase the health and wellness of seniors living in long-term care facilities. Thus, she will focus on relevant literature in theatre arts, gerontology, and health and wellness to create an integrated outcome. She will have a "mastery" in involving the elderly in theatre arts programs.

In regard to your comments on the syllabi, we agree with your concerns and we are modifying the two syllabi to address these issues and make our intended meaning clearer.

Thank you for your feedback,
Ann Schauber

From: Burns, Leslie
Sent: Wednesday, September 07, 2005 11:14 AM

To: Schauber, Ann
Subject: RE: Curriculum liaison for adding and MSIS degree

Dear Ann,

Here are the comments/questions on the Category I proposal from the Department of Design and Human Environment:

Overall, the Department of Design and Human Environment is supportive of the proposal for an addition of an MSIS degree and a re-vamping of the MAIS degree. For the past few years, DHE has not agreed to be a lead department for MAIS students. This was because these students were not included in our headcount for graduate students and yet faculty spent as much time with these students as with students receiving an MA or MS in DHE. Our current involvement with MAIS students (and with MSIS students if this proposal is approved) will be discussed by the DHE faculty this academic year. It will be important that how MSIS and MAIS students "count" for departments is clearly articulated.

Although there is discussion of a stricter review of applicants, the proposal needs to develop criteria by which they will evaluate the applicant's ability to integrate. In other words, for those individuals who are reviewing the application they need a set of criteria to use.

Also, in their learning outcomes they state students will have mastery of the subject matter in the three fields. We are not sure our master's students have "mastery;" if this is what is meant then there needs to be discussion of how this can be achieved in 45 credits.

Use of word methodology is problematic in several places including the syllabi. Methodology is study of methods; we believe in most places where it is used, the correct word would be method. Students are learning methods and using methods; they are not themselves (generally) embarking in a methodological study.

In the syllabus for IST 511 -- it is not clear how students will be taught to integrate and synthesize information. The student projects need to be described and there needs to be a discussion of how learning is expected to occur in more detail.

For IST 512 -- use of terms is problematical. The word portfolio should not be used when what is meant is proposal. And it is critical that a research proposal be a part of this course, so I strongly recommend, so there is no confusion, that the word portfolio not be used.

Another area of terminology confusion is in the Course Topic list, item 4. It currently reads -- "Instrumental, strategic, and pragmatic forms vs. critical and reflexive forms of interdisciplinary study" -- these terms either need to be defined or changed. What I hope this means is that the students will learn about a variety of inquiry paradigms including positivism, interpretive approach, and the critical science approach.

Best wishes as you move forward with this proposal.

Draft

Introduction to Interdisciplinary Graduate Studies

IST 511 Syllabus

Course Information

1 Credit, offered Fall, Winter, and Spring Terms

Instructor Information

Dr. Ann C. Schauber
Director of Interdisciplinary Studies
347 Snell
541-737-2315
ann.schauber@oregonstate.edu

office hours: tbd

Course Description

This first term graduate course is designed to support the student in understanding and navigating the interdisciplinary graduate study process. The course will introduce the methods of interdisciplinary study which include dialogue, process, inquiry, transformation, interaction, construction, and negotiation. Students will participate in group dialogues as a means of practicing interdisciplinary inquiry. Dialogues will be focused on student's programs of interest.

Course Objectives

The objectives of this course are to:

- Introduce new MAIS/MSIS students to the processes and practices of graduate study at OSU;
- Build a supportive graduate community;
- Introduce students to research resources;
- Develop an understanding of what interdisciplinary study requires;
- Begin to deepen focus of inquiry for each student.

The class may vary in format. Some terms the class will meet for five weeks for two hours each week. Other terms the class will meet for ten weeks for one hour each week.

Desired Student Outcomes

Students will

- Have a clearer understanding of what is involved in completing a master's degree;
- Know where to find research resources at OSU and throughout the web;

- Feel connected to a group of graduate students with whom they can seek support and encouragement throughout their time at OSU;
- Gain a deeper understanding of what interdisciplinary study is and what the process of synthesis entails;
- Begin to focus individual interdisciplinary inquiry.

Proposed Schedule of Course Topics

Week 1 – Building an Interdisciplinary Community of Scholars

Week 2 – What is graduate study – how to navigate the system

Week 3 – Learning Styles and Differences – Working effectively with faculty

Week 4 – Resources at your fingertips

Week 5 – The process of integrating three fields of study

Week 6 – The thesis or the research project

Week 7 – Developing and focusing the inquiry:

Week 8 – Student presentations on interdisciplinary nature of their graduate studies and intended outcomes

Week 9 – Student presentations continued

Week 10 – Final student presentations and course evaluation/closure.

Course Requirements

1. Readings and mini assessments as assigned
2. Complete a web search using online journals and other OSU electronic resources
3. Presentation on interdisciplinary focus of course of study
4. Completion of first draft of Program of Study

Resources

MAIS/MSIS Student Handbook

**Proposed Course Outline for a Course Addressing
INTERDISCIPLINARY STUDY
for the MAIS/MSIS degree
IST 512: Applying an Interdisciplinary Perspective**

This course adheres to all OSU academic regulations as found in the *Schedule of Classes*. Students with documented disabilities who may need accommodations, who have any emergency medical information the instructor should know of, or who need special arrangements in the event of evacuation, should make an appointment with the instructor as early as possible, no later than the first week of the term.

1. COURSE INFORMATION:

Term, class meeting dates and times, room location

2. INSTRUCTOR INFORMATION:

Name, OSU address, office hours, phone number, fax number, and email address

3. COURSE DESCRIPTION:

This course is designed to help students in Master of Interdisciplinary Studies program develop knowledge and skills in theory, research methods, and practice of approaching problems, issues, or events from an interdisciplinary perspective. The course is concerned with the process of research -- from the selection of the research topic to the dissemination of research findings. The course involves reading, evaluating, and writing research proposals, learning about submitting proposals for funding, and discussing ethical issues involved in conducting research. We will discuss issues concerning selection of a research topic, methodology and data collection, data analysis and interpretation, ethical and political aspects of research, and finally writing for publication. The primary assumption here is that the best way to learn about interdisciplinarity is to actively engage in interdisciplinary thinking. Through developing and writing a research proposal you will be able to synthesize and critically evaluate information and perspectives from different disciplines.

4. COURSE OUTCOMES:

- Students will be able to define interdisciplinarity for themselves for their areas of study
- Students will be able to analyze other interdisciplinary projects through in class peer review process
- Students will be able to identify possible sources of funding
- Students will develop a Proposal that will prepare them for their thesis or project
- Students will prepare an annotated bibliography of relevant sources for their literature review

5. COURSE TOPICS:

1. History of development of disciplines
2. Approaches and their Defining Characteristics: Multidisciplinary, Interdisciplinary,

3. Transdisciplinarity
4. Problems as a Focus for Interdisciplinary Study
5. Developing the holistic perspective through breadth, depth, and synthesis
6. Selection of a research topic, methodology and data collection, data analysis and interpretation, ethical and political aspects of research, and finally writing for publication
7. Communicating across disciplines

6. RESOURCES:

7. COURSE REQUIREMENTS & ASSESSMENT:

Course Assignments

1. Contribute to the construction of a template for analyzing readings, guest speakers, etc. Turn in template for each reading assignment, analysis of peers' work, and/or guest speaker presentation

Instructor assessment: See attached scoring guide

Peer assessment:

Due Date:

2. Develop a proposal:

Proposal sections:

- a. Identifying the topic
- b. Defining the scope of work—what are the limits?
- c. Literature Review—annotated bibliography of salient readings (consult with major professor); submit copies of the readings with bibliography
- d. Known, Knowable, Unknown
- e. Methods
- f. Executive Summary
- g. Identifying sources of funding
- i. Develop an IRB protocol for the project

Instructor assessment:

Peer assessment: See attached scoring guide

Due Date:

Attendance/Participation	15
Analysis Templates (4)	10 each = 40 total
Portfolio	35

Total 100 points

Grades in the Class will be computed as follows:

95 -- 100 %	A	80 -- 83 %	B-
90 -- 94 %	A-	74 -- 79 %	C

84 -- 89 % B 70 --73 % C-

2. Six sections of a research proposal

Enclosed is a list of primary sections in a "standard" research proposal. For each week you will write a section of your research proposal and make sufficient copies of the write up to share it with the class. Each section should not exceed three double-spaced typed pages. Obviously, you will receive copies of the sections written by other class participants. Over the weekend you will read those section descriptions and prepare for discussion. Because the course is organized to provide feedback on each section of your research proposal, it is necessary that you submit each section in a timely manner. We will not discuss late proposal sections in a later class meeting and late proposal sections will not receive class credit.

3. Research proposal Based on suggestions and comments on your proposal sections throughout the term, you are to write a research proposal according to the guidelines provided in class.

Schedule of Course Topics and Assignments

Date	Topic	Readings	Crse Objectives
Week 1	-An Introduction to Approaches and their defining characteristics: multidisciplinary, interdisciplinary, Transdisciplinary - Presentation of models from the course instructors' fields of interdisciplinary study.		
Week 2	-Evaluating interdisciplinary proposals We will constitute ourselves into two or three groups of "experts" to evaluate proposals for funding and to assess their success in interdisciplinary perspective. Developing a template to assess interdisciplinary research proposals.		
Week 3	Problems as a Focus for Interdisciplinary Study Instrumental, Strategic, and Pragmatic Forms vs. Critical and Reflexive Forms of Interdisciplinary Study		
Week 4	Reading and Evaluating: Ethics and human subjects Submit Introductory problem statement	Read Statement on Problems of Anthropological Research and Ethics ; Role and Function of the Committee on Ethics ; Rule and Procedures ; Draft AAA Code of Ethics ; Ethical Obligations and Federal Regulations in Ethnographic Research and Anthropological Education by Murphy & Johannsen)	
Week 5	Reading and Evaluating Introductory problem statement Submit Theoretical background		
Week 6	Reading and Evaluating Theoretical Background: Submit Research methodology, plan, time line, and budget	(read Informed Consent in Anthropological Research: We are not Exempt by Fluehr-Lobban)	
Week 7	Reading and Evaluating Research methodology, plan, time line, and budget Submit Significance and conclusion	Section on ethics and human subjects due on	
Week 8	Reading and Evaluating Significance and conclusion		
Week 9	Sample proposal presentations Learning to use technology for presentations	List of possible publications due on	

	Thesis writing, Project writing, Paper writing, and writing for Publication		
Week 10	Presentations: Full proposal	Final version of research proposal due on	

Sections of a "Standard" Research Proposal

A. Project Statement

- i. Introductory statement
- ii. Theoretical background
- iii. Research methodology and plan (time line and budget)
- iv. Significance and conclusion

B. Statement on Ethics and Human Subjects

C. Dissemination of Results

- i. List of possible research publications

Proposal Evaluation Guidelines

The purpose of our funding agency is to support innovative scientific and scholarly research in all branches of anthropology. Although all of us (experts) are not anthropologists, we are well equipped to spot a "worthy" proposal in a clutter of badly written, vague, and simplistic proposals. In order to reduce "subjective evaluation," we have developed the following set of criteria for rating these proposals.

1. Clearly written
2. Complete information provided on research topic, objectives, and research methodology (presents a well-planned research process)
3. Clear evidence of and justification for interdisciplinary thinking
4. Justification for using specific research techniques clearly presented
5. Relevant literature on the topic is reviewed (shows a clear promise of developing a theme which will add to the scholarly understanding of the subject area of research)
6. Research goals are realistic and can be achieved in the allotted time for research (12 to 18 months)
7. Represents original thinking
8. Relevant research topic (addresses an issues or issues of general importance to scholars within one or more disciplines)

There are two options under the MAIS/MSIS program

Option A. Thesis option. The thesis is a systematic study of a significant problem which integrates knowledge from the three fields. The requirement is 6 to 9 credits of thesis to be registered in the primary field i.e. (as 503).

Option B. Project option. The project is a significant undertaking which integrates the knowledge from the three fields into a working deliverable such as a curriculum, a film, an exhibit or product which addresses the student's interdisciplinary issue or problem.

- a. What specific learning outcomes will be achieved by students who complete this course of study?

Evidence of ability to integrate two or more disciplines in the study of a problem or issue.

Ability to articulate a researchable question that requires the integration of 3 fields of study and that cannot be addressed from a single, disciplinary perspective.

Generation of a final, culminating project or thesis that makes measurable progress toward understanding of the interdisciplinary issue or problem identified by the student.

Mastery of disciplinary subject matter in 3 fields of study sufficient to support the scholarly study of an interdisciplinary issue or problem.

Required Readings:

GRADUATE COUNCIL MEETING

January 19, 2006

3:00pm, MU 212

Present: Koenig (chair), Filtz, Francis, Gitelman, Harter, McMullen, Proebsting, Rettig, and Tadepalli

Absent: Gupta, McCandless, McLain, Rockey, Unsworth

Guests: Martin Fisk, Doug Markle

1. Minutes from the Meeting on December 1

The minutes from the Graduate Council on December 1, 2005 were approved as distributed.

OLD BUSINESS

MAT Cascades Campus

Hal Koenig (College of Business) reminded the Council that at its December 1 meeting, members raised concerns over the library holdings documentation within the College of Education's proposal for a Master of Arts in Teaching degree on the OSU Cascades campus. Koenig told the Council that that issue has been resolved.

Koenig also informed the Council that the Curriculum Committee, which is reviewing the undergraduate version of Education's proposal, had even greater concerns over the proposal's lack of detailed documentation. They felt that the School of Education had not provided enough information for the Committee to make an informed decision.

In order to prevent future submissions of similarly incomplete proposals the co-chairs of the Curriculum Committee are planning to modify a document found on the OUS website (unmodified document appended to these minutes) and adopt it for their use. The revised document will outline the information that is to be submitted in support of requests for approval of delivering existing academic program(s) to the Cascades campus. With the growth of the Cascades campus will come an increase in the number of new program proposals. Curriculum Committee hopes the new procedures will assist them in getting the information they need to make decisions in a timely fashion.

Koenig informed the Council that they might want to consider inviting the co-chairs of the Curriculum Committee to meet with them in order to discuss their new procedures once they have been formalized.

Sally Francis (Graduate School) asked Koenig if he is suggesting asking the Council to consider revising the Council's MOU (Memorandum of Understanding) clarifying the OSU-Cascades approval process for establishing existing OSU Degrees and Certificates on the Bend campus.

Bruce Rettig (Graduate School) explained to the Council that if a unit's new program proposal includes a graduate program, Graduate Council is asked to endorse it before it can proceed to the Curriculum Committee. Therefore it would be useful for the Curriculum Committee to articulate to the Graduate Council what they propose to do so that we may decide how we may wish to proceed. Rettig suggested that either the co-chairs of the Curriculum Committee could attend a Graduate Council meeting or they could write up whatever it is that they are proposing and forward it to the Graduate Council for review. Rettig indicated that he felt that it would be more effective if our respective procedures were aligned.

2. Follow-up Report of the Master of Arts in Applied Anthropology

Martin Fisk (Oceanic and Atmospheric Sciences) joined the meeting. After introductions, Koenig informed the Council that the report that Fisk came to present is actually the second follow-up report prepared after the full review of Anthropology's graduate programs conducted in 2002. Fisk further explained that he was the chair of the original review panel which also included Tom McLain and that the two of them were assigned to conduct the two follow-up reviews.

Fisk reported that in 2004, at the time of the first follow-up review, John Young was Chair of the Anthropology department and it appeared to Fisk and McLain that not much effort had been made toward following the recommendations made by the review panel in 2002. Graduate Council heard the first follow-up report and though the Council accepted the report they ordered that a second follow-up review be prepared in a years' time.

In preparing for the second report, Fisk and McLain met with David McMurray, currently interim chair of Anthropology, after first sending him all the previous reports including the response to the first follow-up report from John Young to the Graduate Council. Fisk learned that David McMurray had not previously seen any of these documents and therefore should probably not be held accountable for any progress or lack of progress the department has made toward addressing the review panel's recommendations.

In the original review, there was strong concern over the extended length of time Anthropology students took to complete the master's degree. Fisk reported that the department has recently instituted a four-year time limit.

Another issue raised in the original report was the amount of graduate student debt acquired while in the program due to the very limited funding offered. Fisk reported that Anthropology has addressed this by limiting the number of new Master's students entering the program and by obtaining additional Teaching Assistantships. The Department has also secured two Ph.D. assistantships (and will limit the number of entering Ph.D. students to two this fall). Overall Fisk and McLain were happy to see that the change in management has changed the outlook for the department.

In their report they concluded that they felt that the department was on the right track. Fisk concluded by mentioning that McMurray informed him that he would like to meet with Sally

Francis to propose that the program undergo another full review earlier than previously scheduled.

Theresa Filtz (Pharmacy) asked Fisk about the previous student funding issues in Anthropology. She also asked Francis if it is now a priority with the university to at least partially fund Master's Students so that they will not fall into such great debt. Francis responded that it is not and that the concern with funding master's students was specific to Anthropology because the program admitted many more students than they could support and the funding problems were compounded by students' extended time to degree (often over seven years).

Rettig related that since McMurray has become Chair, he has received many calls from him and briefly described one discussion regarding time to degree. McMurray had asked Rettig if Anthropology could set an even shorter official time limit than the seven-year limit set by Graduate Council. Rettig reported that he sees a positive shift in thinking in the department. He feels that McMurray is serious about improving his programs.

Starr McMullen (Liberal Arts) expressed her concern that McMurray had not previously seen the review reports before Fisk had forwarded them to him. She asked if the 2002 review report was not shared with the Anthropology faculty. Fisk answered that he assumes that the report never left John Young's desk. When McMullen expressed her concern, Francis assured her that in her experience most department heads are eager to share the report with their faculty and special retreats are often scheduled to discuss them.

McMullen asked Fisk about the three Ph.D. program concentrations being dropped in favor of bringing in two students and noticed that the department also dropped some required courses for the master's degree. McMullen asked if the department switched those courses over to the Ph.D.. Fisk answered that he recalled that in the original review, the reviewers felt that the new Ph.D. program was too big a fish to swallow and he thinks that the department now recognizes that too and they are now focusing on a package that they can actually accomplish. Fisk told McMullen that he did not know if the Master's courses were moved to the Ph.D. program. McMullen explained that what she is wondering about is what courses the first Ph.D. students are going to take. She asked Fisk if Anthropology has Ph.D. courses or will the incoming Ph.D. students just be doing independent study.

Rettig reported that when the original CAT I proposal came before the Graduate Council the Anthropology department committed to a number of graduate stand alone courses in order to meet the 50% rule.

Francis asked Fisk to clarify an item on one of the report's attachments which indicated that with the institution of the new four-year time limit, 30 of the 75 MA students would be cut. Francis asked if there would be a phase-in process and asked how students would be notified. Fisk answered that his feeling is that there would not be any cutting done, but that the students who have been in the program too long a time are being told that it's time to finish up. They will have the opportunity to finish. Fisk explained that the unit intends to shrink the program by not admitting as many students as was their custom.

McMullen informed the Council that she is concerned that units in the CLA often want to add new programs, which require more resources, without realizing that some other budget would have to be cut back. She is concerned about Anthropology's budget. Fisk remarked that Anthropology is also concerned about the costs involved with starting the new program.

Discussion was held concerning possibly revising the timing of Anthropology's next review. Koenig reported that one thought was that the Council might want to move the report up. Francis reported that a five year OUS review of the new Ph.D. program would be scheduled and that the executive committee of the Faculty senate had recently called for a three year internal review of all new programs as well. Francis recommended that she talk with McMurray to see if those reviews would satisfy his department's need.

A motion to accept the follow-up report as submitted was moved and seconded. All voted in favor. Motion passed.

Fisk and McMullen left the meeting.

3. Follow-up Report of the Master of Science in Environmental Health and Occupational Safety Management

Doug Markle entered and introductions were made.

As background information Markle told the committee that he and Barbara Bond were assigned both to the original Graduate Council review panel and to the follow-up committee. The original review of Public Health occurred in 2003 with the reviewers making fifteen recommendations and one procedural recommendation.

Markle first described the procedural recommendation. The original review reviewed only one degree program in a department that had six different degree programs. The reviewers felt that expecting the Graduate Council to review individual degree programs in a multi-program department and for the department to have to deal with that is neither desirable nor efficient. Therefore they recommended working with the department to coordinate their accreditation review with a Graduate Council program review of all their graduate degree programs.

Markle told the Council that at the time of the original review, the department of Public Health was going through tremendous changes. They were contemplating completely dropping the undergraduate program, increasing the number of graduate students, decreasing the number of graduate teaching assistantships and increasing the number of graduate research assistantships. The department planned to take the money being saved on GTAs to hire new faculty and increase faculty research funding. The department would be changing from a faculty doing a fair amount of undergraduate teaching to a faculty doing graduate teaching and research only. Markle alerted that Council that many of these departmental changes have come to pass and therefore some of the recommendations made during the original review no longer apply.

The reviewers' first recommendation was to consider moving the EHOSM MS students into the MPH (Master in Public Health) program. The reviewers believed this to be a good idea because

the MS in EHOSM was a non-accredited program with few students (about ten). Markle remarked, however, that this program's graduates had a very high placement rate. The MPH program was a larger, accredited program very highly ranked in the country. It also had five different tracks including a dormant track in Occupational Health and Safety. The reviewers therefore believed that incorporating the EHOSM program into the MPH made quite a bit of sense. Markle reported that instead of precisely following this recommendation the department decided to start a new MPH track and are retaining the MS degree in EHOSM. They wanted to keep the EHOSM

program because it is tied to a fellowship and they believe it is successful in servicing students wanting to get jobs in the private sector. Markle remarked that by having such similar program names, the department of Public Health could be confusing applicants (the MPH degree is in occupational environmental safety and health and the MS degree is in environmental health and occupational safety management).

The second big recommendation was to eliminate the MS in Public Health (not the same program as the MPH: Master of Public Health) partly because there were only two students in that degree program at the time of the review. Although this recommendation is still under discussion in the department, Markle feels it is likely that the MS in Public Health will be eliminated within a year or so.

Markle told the Council that there were a few student complaints heard during the review concerning the department's instrumentation courses. The problem was that the college did not have the instruments needed to provide students with hands-on experience. Since the time of the review, one of the courses has been eliminated. Additionally, it is now the department's policy to make it very clear to students that if they want experience with mass-spectrometers and other instruments they will need to go somewhere else. In addition the department encourages internships which usually include some instrument training.

Another recommendation was for the department to consider new ways to promote cohesion among the graduate students. At the time of the review the MPH program had many more students and they were more cohesive than the EHOSM students who were primarily non-traditional students (part time, with part time jobs). The acting department chair feels that there is more student cohesion with the department's institution of a new mentoring program.

Because of the department's rather dramatic change to a focus on graduate research, the review panel recommended that the department needs to make promotion and tenure expectations clear to entering junior faculty (who would naturally be held to a different standard than the faculty who joined the department before the change). Markle reported that the Department chair directly mentors new faculty on a one to one basis and though the department has no written Promotion and Tenure guidelines, new hires are directed to the university's P&T guidelines.

Although the department has always been successful in obtaining external support for students, the review committee recommended that with their move to a research focus the fundamental priority of the faculty should remain scholarship over grantsmanship. Fisk reported that the Dean and the Chair recognize the distinction and encourage both.

At the time of the original review, there was some confusion concerning whether or not chemistry was needed for admission to these degree programs. The reviewers felt that chemistry was absolutely needed. Markle reported that the department now requires introductory chemistry and organic chemistry and works on a case by case basis to ensure deficiencies are corrected before students begin the program.

Markle concluded his report by briefly touching on Public Health's efforts made toward some of the other recommendations. He also expressed his and McLain's excitement that the department's dramatic switch to an all graduate research focus appears to have been successful. Markle told the Council that Public Health did maintain a minor although the undergraduate program was dropped.

Koenig called for questions.

Prasad Tadepalli (Engineering) asked Markle about the differences between the Public Health programs with the similar names. Markle confessed that it was frustrating to learn how the department differentiated the degrees and he believes that the similar names are a bit of a problem for them. Markle reiterated that the MS in EHOSM was retained because the department felt that the program had a definite role to play while the review panel thought that a certificate program in EHOSM would have been an excellent replacement.

A motion to accept the follow-up report as submitted was moved and seconded. All voted in favor. Motion passed.

NEW BUSINESS

Graduate Student Conference

Francis informed the Council of plans the ASOSU Graduate Student Affairs Task Force Director, David McCandless, has made to redesign the annual Graduate Student Conference for which he is responsible. Instead of the past format featuring presentations of students' scholarly accomplishments throughout the day, workshops will be offered on topics such as building a curriculum vita or designing a poster presentation. Francis asked the Council to recommend additional appropriate workshop topics and/or recommend people who would be able to present a workshop. Francis will forward the suggestions to David McCandless. The Conference has been set for May 24, 2006.

Integrative Graduate Education and Research Traineeship Program (IGERT)

Francis informed the Council of the new change in NSF submission guidelines for the IGERT. Institutions are now restricted to nominating a maximum of four proposals.

Jack Higginbotham (Research Office) asked Francis to propose to the Graduate Council that its members review and decide which four OSU proposals will be submitted. Council members agreed that they would cooperate and discussed possible processes. It was agreed that all members would read the proposals and rank them (#1 being the top/best). The rankings will be

forwarded to Helene by February 13th and the Council will discuss the rankings and decide which four proposals will be submitted at its meeting of February 16th.

The meeting adjourned at 4:19 pm.

Proposal for Delivery of an Existing Program to a New Location

This document outlines the information that is to be submitted in support of requests for approval of delivering existing academic program(s) to new location(s).

1. Program Description

- a. Program title, level, and delivery sites.
- b. Department and school/college that would offer the program. Include the name of the institution program coordinator.
- c. Briefly describe the academic program. List all course titles, including number of credits.
- d. Indicate in what ways the proposed program at the new location(s) will differ from the on-campus program.
- e. List any special requirements or prerequisites for admission to the program at the new location(s).
- f. Is there an accrediting agency or professional society that has established standards for this program? If so, is the program currently accredited? If accredited, what steps would be needed to accredit the program at the proposed new location(s)?

2. Demand

- a. List any similar programs offered at the proposed or nearby location(s).
- b. Provide evidence of need for the program at the new location(s).
- c. Estimate enrollment and number of graduates over the next five years. Will any enrollment limitation be imposed? If so, how will those to be enrolled be selected?

3. Personnel

- a. List the names and qualifications of faculty (regular and adjunct) who will be involved in delivering the program to the proposed location(s). Will new faculty be needed?
- b. Estimate the number and type of support staff needed to provide the program at the new location(s).

4. Other Resources

- a. Describe facilities (e.g., buildings, labs, equipment) necessary to offer the program at the new location(s).
- b. Indicate how library needs will be met.
- c. Indicate how students at the new location(s) will receive student services (e.g., academic advising, financial aid assistance, course registration, access to book/text purchases).

5. Alternative Delivery Methods/Formats

- a. Are alternative delivery methods being used (e.g., telecommunications)? Please describe.
- b. Will this program be delivered in an alternative format (e.g., weekend, evening, on-site)? Please describe.

6. Budgetary Impact

- a. Indicate the estimated cost of the program for the first four years of its operation. (Use the “Budget Outline” and “Budget Outline Instructions” forms on the Forms and Guidelines Web site.)
- b. If grant funds are required to launch the program, what does the institution propose to do with the program upon termination of the grant?
- c. Will the allocation of going-level budget funds in support of the program have an adverse impact on any other institutional program, including the on-campus program? If so, in what ways?
- d. If the program will be financed from existing resources, specifically state:
 - i. what the budgetary unit will be doing as a result of the new program that is not now done, in terms of additional activities, and
 - ii. what these new activities will cost and whether financed or staffed by shifting of assignments within the budgetary unit or reallocation of resources within the institution. State which resources will be moved and how this will affect those programs losing resources.

Second Follow-up Review of the Masters of Arts in Applied Anthropology

(M.A.A.A)

December 2005

The Masters degree program in applied anthropology was reviewed in 2002 by the Graduate Council as part of the regular cycle of graduate program reviews. In 2004 a routine follow-up review was conducted and the Graduate Council discussed that report. The Graduate Council recommended that a second follow up review be conducted in the 2005-6 academic year.

Thomas McLain (representing the Graduate Council) and Martin Fisk (Chairman of 2002 Review) met with David McMurray the new chairman of the Anthropology Department on December 20, 2005 to discuss the previous two reviews and the response by former Anthropology Chairman, John Young. Professor McMurray indicated that he had not seen the 2002 or 2004 reports of the Graduate Council reviews prior to being contacted for our meeting. The issues discussed were streamlining the curriculum, improving time to completion of degrees, student funding, faculty composition and productivity, grant funding, departmental budget, and planning for the new Ph.D. program. David provided several handouts to facilitate the conversation and to address several key points. These are attached.

The number of graduate level world culture courses has been significantly reduced which was a recommendation in the 2002 review.

The department is making efforts to reduce the time to completion of masters degrees and recently instituted a limit of four years for completing the MA. Current students, who are not active, and grandfathered against the continuous enrollment policy, have recently been notified of this time limit. New students are now given copies of "Normal Progress Guidelines" and "M.A. Degree Timeline" documents (attached) and provided explicit guidance for filling out Programs of Study to minimize time of matriculation.

M.A.A.A. students are either self funded or funded by teaching assistantships or research grants. New GT A support for two students has been secured. Some funding is also available from e-campus courses. The department is limiting the admission of new M.A. students to only those that can be supported (typically 7 per year). For the Ph.D. program, which starts Fall 2006, funding has been secured for two students and only two students will be admitted.

The number of full-time faculty is presently eight, down from nine at the time of the 2002 review. Three senior faculty have retired, two assistant professors have been added, and a new faculty member will arrive in 2006. There are no impending retirements. The scheduled increase to 12.5 FTE mentioned in the proposal to establish the Ph.D. program will not be achieved in the next decade.

In an attempt to raise the level of scholarship by the faculty, the department chairman is offering financial incentives for faculty to publish results in the peer reviewed literature.

McLain and Fisk think that given the fiscal limitations and the number of faculty that the new chairman is making satisfactory progress in addressing many of the recommendations given in the 2002 review, and with the concerns expressed by the Graduate Council in January 2005. They recommend that McMurray discuss with Dean Francis some of the challenges with implementing the PhD program and the possibility of a three-year rather than a five-year review of that program.

Submitted by:

Dr. Martin Fisk, Professor, College of Oceanic and Atmospheric Sciences

Dr. Thomas McLain, Department Head, Wood Science and Engineering

Notes for MAAA (Anthropology) Review follow up Dec. 20. 2005

Presently 8 full time faculty; new hire starting Fall, 2006; five fixed term faculty teaching less than .5 fte each.

Efforts made toward streamlining the department:

- deleted from the course catalog ANTH 460/560; ANTH 439, 451, 432,587 and 411-419 plus all 511-519
- Program completion deadline for MA/MAIS of four years put into place which is cutting 30 of the 75 MA students from the program; restricting admission of new MA students
- dropped the three concentrations in the Ph.D. in favor of bringing in only 2 best candidates and only candidates with funding.

University Mission Compliance activities

- Received two GT As for international student mentoring (with Moira Dempsey) and to manage anth 208, 209 courses for study abroad students

Strategic Initiatives Activities

- Department has signed onto the Sustainable Rural Communities initiative
- Developing a Rural Studies Certificate
- Received support for 1 Ph.D. student
- Received research money for several grad and undergrad researchers

Improving Departmental Productivity

- Instituted summer research write up funds to cover one month writing time
- Instituted cultural anthropology field school development funds for both grads and undergrads
- Instituted a DeLoach Scholarship-like fund to allow grads and undergrads to work with profs. on projects
- Liberal travel money and classroom enhancement money now made available
- Instituted making classroom enhancement and travel money available to fixed term faculty

Improving Student Affairs

- increasing funding possibilities for grad students via greater ecampus involvement
- received two GT As in International Education
- instituted "Normal Progress Guidelines" for MA & MAIS Degree Timeline
- began a late fall term meeting with new students to go over program planning

Money Matters

- Library money in Ph.D. proposal = \$6,000/yr for 4 years. Who pays?
- TA support in Ph.D. proposal = \$10,000. Who pays?
- .5 position with education. No money.
- John's replacement? 50-50 chance
- Chance of increasing faculty numbers beyond PERS casualty replacements? Next to nil.

Normal Progress Guidelines

To encourage Anthropology graduate students to complete their educational program in a timely fashion, a set of benchmarks have been established. These normal progress guidelines help students assess their own progress. They also enable departmental administrators to identify problems early and to provide timely advice and assistance. Students who fail to meet normal progress guidelines risk losing their research or teaching assistantships and also may be dismissed from the program.

The benchmarks for M.A. and M.A.I.S. students are:

- Maintain a 3.0 grade average overall.
- Maintain a 3.0 grade average for courses in the program of study filed with the Graduate School.
- Maintain a 3.25 grade average for anthropology core courses.
- Complete required courses and the thesis within four years of entering the program. (Funding normally is available for no more than the first two years).

M.A. Degree Timeline

Students are encouraged to complete their educational program in a timely manner. To do this, we have provided the following suggestions:

- Anthropology core courses should be taken the first year.
- A thesis topic and your committee should be chosen before the 3rd term of your first year.
- All course work should be completed by the end of the 2nd year.
- The thesis defense date must be reported to the entire committee one quarter in advance of the defense.
- The major professor must receive the final thesis draft at least six weeks before the intended defense date.
- Your major professor must read your 1st draft and return it to you within three weeks.
- Register with the office staff (1) when you choose a defense date and (2) when you submit your final thesis draft to your major professor.
- The committee members must receive the final draft two weeks before the defense.

**GRADUATE COUNCIL FOLLOW-UP REVIEW OF
ENVIRONMENTAL HEALTH AND OCCUPATIONAL SAFETY
MANAGEMENT**

Department of Public Health

College of Health and Human Science

Oregon State University

1 December, 2005

GRADUATE COUNCIL FOLLOW-UP REVIEW OF ENVIRONMENTAL HEALTH AND OCCUPATIONAL SAFETY MANAGEMENT

This follow-up review of the Masters of Science program in Environmental Health and Occupational Safety Management (EHOSM) was conducted by Douglas Markle, College of Agricultural Science, and Barbara Bond, College of Forestry. We had a pre-review meeting November 17, received a written response to the recommendations contained in the original review on November 28, and met with the Chair, Marie Harvey, and program coordinator, Cathy Neumann, on November 29. Because of scheduling problems, Dr. Bond was unable to attend the November 29 meeting but provided questions and subsequent input to this review.

At the time of the original review, the program was contemplating substantial changes including: dropping the undergraduate program, increasing numbers of graduate students, decreasing GTAs, increasing GRAs, increasing faculty FTE, and increasing faculty research funding. The undergraduate program has been dropped but a minor in Environmental Safety and Health has been created. The Department and Program are still in transition but seem to have made considerable progress towards their goals. The original recommendations, written responses, and commentary follow.

Recommendations:

- 1) Consider moving EHOSM to the MPH degree. Currently the M.S. in EHOSM is a non-accredited degree program with minimal enrollment, approximately 10 students. In contrast, the MPH program is accredited, ranked second nationally, and enrolls approximately 82 students in three distinct tracks (Public Health Promotion and Education, Health Policy and Management, and International Health). Five other tracks, including Occupational Health and Safety, are approved under the MPH program, but are dormant. The review committee feels the M.S. in EHOSM would be better located under the MPH program in an EHOSM track. This recommendation would offer several important advantages detailed in our report.

Response: As of fall 2005, we began accepting students into a new Environment, Safety and Health MPH Track, as part of Oregon MPH Program. We are keeping our M.S. degree in EHOSM because it is part of a NIOSH fellowship and meets the needs of students who want to work in the private sector with industries.

Commentary: The M.S. program still has about 10 students and they are still easily placed in jobs after graduation, so the Department feels the program serves a legitimate academic need. The new MPH track has 6 students in its first year which is considered a very good start. The goal of increasing numbers of graduate students appears to be on track.

- 2) Consider eliminating the M.S. in Public Health. While this recommendation is admittedly beyond the “charge” of this committee, we feel the Department’s new direction makes this an opportune time to re-evaluate a traditionally low-enrollment (currently only two majors) program.

Response: Our Department is having on-going discussions on this topic and we will likely eliminate this degree sometime in 2006.

- 3) Re-evaluate some core courses. We encourage expanding the required core to include an environmental health course, such as H 540 (Environmental Health). The purpose of H 542 (Environmental and Occupational Health), required only for the Occupational Safety (OS) concentration, is not clear. This course would seem to duplicate the core required for H 545 (Occupational Health).

Response: Please see new EHOSM M.S. degree (below). This has been in effect since fall of 2004. We have completely revamped our program by merging the two concentration areas.

M.S. in Environmental Health and Occupational Safety Management (49 credits)

Required Core (28 credits)

H515 Research Methods (3) or H525 Principles of Epidemiology (3)
H524 Health Data Analysis (4)
H548 Public Health Toxicology and Risk Assessment (3)
H540 Environmental Health I (3)
H541 Environmental Health II (3)
H546 Industrial Hygiene Instrumentation (3)
H585 Environment, Safety and Health Policy and Law (3)
H588 Occupational Safety and Health (3)
H595 Design and Management for Environment, Safety and Health (3)

Thesis or Project H503 or H506 (6 credits)

MINOR (15 credits)

Commentary: This recommendation was from the outside reviewer and has clearly been implemented.

- 4) Evaluate effectiveness of internships as a substitute for courses requiring instrumentation (H543 and H546).

Response: H543 has been deleted when we streamlined our program above. H546 remains a part of the program and graduates are encouraged to do internships. For example, one M.S. degree graduate student in the program is currently doing an internship with a demolition company in Eugene OR, to evaluate and update their safety program.

Commentary: This recommendation was also from the outside reviewer and has been partly implemented. At this time, there is no evaluation of effectiveness but the program is making clear to all prospective students that it is not a lab-based program and directs students to other institutions if they seek those types of programs.

- 5) Consider ways to promote more cohesion among all departmental graduate students especially during this time of change. This should include continuation of program strengths (orientation for new students, list serve & student handbook) but might include modifications such as a single graduate student handbook with recommended course sequences, a student-organized seminar series, a larger role on Departmental committees, or creation of a student lounge area.

Response: There are several ways this is being accomplished:

1. Graduate students are invited to attend thesis presentations
2. This year we instituted a graduate mentoring program, with a pizza party for all new students and mentors
3. Graduate students participate in faculty searches
4. There is a single handbook for all MPH students in the Dept.
5. There is a MPH research symposium, every other year as well as the Oregon Public Health Assn. Meetings were held at OSU this year, where there was a poster session designated for graduate students.

Commentary: Both Dr. Harvey and Dr. Neumann feel there is more cohesion department-wide. Older graduate students serve as mentors to new students. They have no rigid structure for this mentoring and say that it seems to be helping new students make the transition. Professional presentations are being encouraged by paying student registration fees for all presenters at regional and national meetings. About 12 students in the Department gave posters at the Corvallis meeting and they won 2 of the 3 best student poster awards.

- 6) Make Promotion and Tenure expectations clear to junior faculty and any new hires and mentor all faculty through the transition.

Response: Chair is currently working with 1 assistant professor, 1 associate professor (without tenure), and two associate professors to be promoted.

Commentary: The Department has no written P&T guidelines but directs faculty to the University guidelines. In addition, the Chair has discussed P&T expectations with the Dean and the faculty.

- 7) Continue the excellent external support of students and pursue more outside research funding, but recognize the difference between scholarship and grantsmanship, the fundamental priority of the former, and the importance of maintaining faculty morale, especially if dollar targets for outside grants do not materialize in a timely fashion.

Response: ESH faculty continue to find funding for graduate students and the Dean and Chair acknowledge the difference between scholarship and grantsmanship and they encourage both.

Commentary: The transition in the Department's focus from undergraduate and graduate teaching to graduate teaching and research is in full progress. Three faculty were hired last year, all at higher ranks and all with funded research programs. Two searches are underway this year and similar hires are anticipated. In the P&T discussions with the Dean and faculty, the Chair has made clear that grantsmanship does not

necessarily equal promotion, especially for the older hires, but that scholarship is important. Student research funding through GRAs is increasing and faculty also arrange for direct funding of students, especially with industry employers.

- 8) Re-evaluate admissions requirements and expectations for students entering with non-science backgrounds.

Response: We do this with every applicant, and have established both provisional requirements and suggested course recommendations based on the student's work experience and academic record.

Commentary: This recommendation was primarily directed at the student's background in chemistry. The standard now is introductory chemistry and organic chemistry and the Department works on a case by case basis to insure deficiencies are corrected, often in summer before admission.

- 9) Move cautiously as the GTA budget is reduced and regularly evaluate the impact.

Response: The GTA budget was never reduced.

Commentary: Rather than reduce the GTA budget to create FTE for new faculty, the College has found other funds for FTE for five new faculty.

- 10) Move forward on a certificate program in EHOSM as a way to address the needs of working professionals and increase total enrollment.

Response: We are not doing this but rather focusing on both MPH and MS programs.

Commentary: This was a resource decision whose implementation would have detracted from the overall goal to increase research effort.

- 11) Conduct exit interviews of all graduates for on-going internal assessment of the effectiveness of the program and extent to which high placement rates are due to graduate quality or market demand.

Response: We are not currently doing this, but once the OMPH program has an established exit interview process we will adopt this and use it for MS degree students as well.

Commentary: They expect a process to be in place next year.

- 12) Mentor entering students on the process of research, including research funding possibilities.

Response: We do this routinely with new and existing graduate students in our Dept.

Commentary: The Department is using two listserves to advertise funding and other research opportunities to graduate students.

- 13) Consider giving graduate students a larger role in Departmental committees.

Response: Graduate students currently serve as representatives for our MPH Coordinating committee and faculty searches. As mentioned earlier,

this year we have also implemented a mentoring program for new graduate students in the Dept.

- 14) Develop a long-term strategy to improve or replace student office, laboratory and computing facilities.

Response: Currently, the Dean is working on finding funding to renovate the 4th floor of Waldo Hall.

- 15) Maintain the positive, mutually supportive relationship between faculty and administration during the term of the two-year interim chair.

Response: We will have a permanent Chair as of June 2006 (Dr. Marie Harvey).

Procedural Recommendation:

In the original review we noted that we reviewed one degree program in a Department offering six graduate degrees and recommended that the Masters in Public Health (MPH) program review, scheduled for 2008, be changed to a review of all graduate programs in the Department of Public Health, including EHOSM. This review and follow-up should be supplied to the 2008 Review team.

GRADUATE COUNCIL MEETING

December 1, 2005

3:00pm, Kidder 128

Present: Koenig (chair), Filtz, Francis, Gitelman, Harter, McMullen, Pehrsson, Proebsting, Rockey, and Tadepalli

Absent: Gupta, McCandless, McLain, Rettig, Unsworth

Guests: Sam Stern, Colleen Hill (via phone), Tammy Bray, Sheryl Thorburn, Leonard Friedman

1. Minutes from the Meeting on October 20

The minutes from the Graduate Council on October 20, 2005 were approved as distributed.

2. Category I Proposal for Name Changes in the Department of Bioengineering: Announcement of Results of E-mail Vote

The proposal to change the name of the Bioresource Engineering graduate degrees to Biological and Ecological Engineering was originally introduced and discussed in the October 20 meeting of the Graduate Council, but voted upon at a later time electronically. Sally Francis (Graduate School) explained that this CAT I proposal was returned to today's Graduate Council agenda, as a mechanism to get the results of the electronic vote into the minutes. The result of the e-vote was that the proposal was approved as revised.

3. 700-level courses on a PhD Program of Study (follow-up)

As this was her first time attending a Graduate Council meeting this quarter, Dale Pehrsson (School of Education) introduced herself to the new members of the Council. She then provided the Council with background information concerning the Category II subcommittee's work reviewing a number of 700-level Pharmacy courses.

At its meeting on March 3, 2005 the Council approved a motion that 700 level courses that successfully go through the Category II proposal process (the process used to gain approval for a graduate course) would be accepted as graduate level for programs of study. Pehrsson and the members of the Category II subcommittee determined that the 700 level Pharmacy courses they reviewed offered a thorough graduate education experience and the committee will be recommending to the Graduate Council that the courses be allowed on programs of study.

4. Proposal to offer the Master of Arts in Teaching at the OSU-Cascades Campus

Dean Sam Stern (College of Education) and Colleen Hill (phoning in from OSU-Cascades) announced that they were happy to be before the Graduate Council to talk about offering the Master of Arts in Teaching (MAT) in Bend.

Stern explained that the proposed MAT is the same program, from a curricular standpoint, as the program that has been offered on the OSU main campus for over twelve years. Stern informed the Council that he has been working with the faculty and staff in Bend and with a committee of educators from the Central Oregon community to develop this MAT program. Eastern Oregon University (EOU) had offered a similar program on the Cascades campus, but will be withdrawing it after their 2005-06 cohort has completed. This would leave Central Oregon without a teacher education program. Stern added that there is currently a need for 2,500 additional K-12 teachers in Central Oregon. This presents a growing demand for the preparation of teachers at the local level. The Central Oregon community is excited that OSU is interested in providing them with this vitally needed program. Stern also mentioned that although a high school authorization program is also needed in the area, the MAT program proposed today only offers elementary and middle school authorization.

Sally Francis (Graduate School) then distributed the MOU (Memorandum of Understanding) clarifying the OSU-Cascades approval process for establishing existing OSU Degrees and Certificates on the Bend campus. The policy was approved by the Graduate Council on April 15, 2004. Francis mentioned that the policy could be revised if Council members felt it was needed.

The Council asked Stern for clarification on the following issues:

Library Assessment – Council members were concerned over the library holdings documentation attached to the MAT proposal. The document prepared by the head librarian at OSU-Cascades, provided no summary or conclusion as to the current level of holdings at the OSU-Cascades library, and the full library assessment, originally submitted with the School of Education's March 2003 proposal to add an undergraduate degree in education, concluded that holdings at the Valley Library were only adequate to support undergraduate work. The Council questioned the Valley Library's present ability to handle graduate level needs both here and at OSU-Cascades.

Stern informed the Council that over the past two years work had been done to enhance the Library's collection and that he believed that the concerns raised over the March 2003 assessment had already been resolved.

Council members were unconvinced and asked Stern if meeting the shortfalls highlighted on the old assessment now satisfied the resource level needed for the Library to support graduate work in education. Stern could not respond to that, but told the Council that in 2001 the OSU MAT program was reviewed by a major accreditation body who found

that the OSU MAT program library holdings were sufficient. A Council member suggested that a new library analysis still would be in order.

Faculty and Faculty Support – Council members had a number of questions regarding the number and quality of education faculty at OSU-Cascades. Stern informed the council that two tenure-track faculty positions are currently being recruited with hopes of having them in place by Fall 2006. The proposed MAT program would begin Summer 2006 with a minimum cohort of 24 students. Stern anticipates employing both fixed term and tenure track faculty to serve the MAT program. He believes that the advising load for the new faculty will not be heavy. He informed the Council that the proposed MAT program's faculty will need to meet the same quality standards as OSU campus faculty as the new MAT program will fall under the same accreditation as the OSU main campus MAT program.

Tadepalli (Engineering) broached a concern that the faculty in Bend would need additional support due to their isolation and small numbers. Stern assured him that he is aware of the issue and believes that the people at OSU-Cascades are already implementing strategies to foster faculty community and scholarship in Bend. Pehrsson (School of Education) informed the Council that collaborative work is already a strong part of the OSU-Cascade's culture, with a faculty open to crossing department and college boundaries and providing each other a strong network of support.

Stern and Hill then left the meeting.

After additional discussion, including a discussion of the possible need for the Council to revisit the MOU procedures in terms of supplemental document requirements, a motion was made and seconded to approve the MAT proposal contingent upon receiving the Valley Library's head librarian's signature upon the proposal. All voted in favor. Motion passed.

5. Category I Proposal to Rename the Graduate Certificate in Health Management and Policy

Tammy Bray, Dean (College of Health and Human Sciences), Sheryl Thorburn (Public Health), Leonard Friedman (Public Health) entered the meeting.

After introducing himself, Friedman explained the reasoning behind the proposal to rename to Graduate Certificate in Health Care Administration to the Graduate Certificate in Health Management and Policy. Along with the desire to obtain consistency in the naming of their undergraduate and graduate programs, Friedman informed the committee that the new name is a more accurate reflection of the curricular requirements of the program's students. Bray added that the new name would also help to distinguish OSU's health programs from Portland State's program.

6. Category I Proposal for Name Changes for degrees and Minor in Health Promotion and Education

Thorburn described similar reasons for changing the names of the programs and minor in Health Education (including changing the name of the M.S. program in Health Education to the M.S. Program in Health Promotion and Health Behavior). She explained that over time many of the department faculty members have shifted the focus of their research to behavioral issues (e.g. obesity, smoking) and that the degree has also evolved to a more comprehensive community-based health promotion program. Bray added that the name changes will also aid in the recruitment of new faculty members doing similar research. She told the Council that the College of Health and Human Sciences now has a research cluster in behavior and that the proposed name changes would allow the cluster to become more visible to the education community.

After answering the few questions asked, the visitors left the meeting.

No discussion was held concerning the two CAT I proposals, but Pehrsson (School of Education) told the Council that she has noticed that the College of Health and Human Sciences has realigned since Bray became Dean. She said she is aware of awesome changes and finds it very exciting. Koenig (Business) added that he shares Pehrsson's view of the College's forward movement.

Motions were made and seconded to approve both CAT I proposals from the Department of Public Health. All voted in favor. Motions approved.

The meeting was adjourned at 4:33 PM.

Proposal to Offer an Existing OSU Graduate Program at the Cascades Campus

College: Education
Department: Teacher and Counselor Education
Degree: Master of Arts in Teaching (MAT)

Rationale:

The Oregon State University College of Education and Oregon State University-Cascades began exploring the feasibility of offering the Master of Arts in Teaching (MAT), which includes an Initial Teaching License in Bend during Spring quarter 2005. A committee of educators from Central Oregon was formed and met to advise OSU-Cascades about the local needs for the MAT program. It is clear from the reports from the committee that there is a need for a one-year, full-time Initial Teaching License MAT program that will serve the needs of local students. The existing program for licensure, the Education Double Degree is a baccalaureate program that enables students currently seeking a degree at OSU to earn two undergraduate degrees concurrently – one in their chosen field and one in education. The Double Degree program does not meet the needs of the many people in the Bend community who already have a BS or BA degree and who are seeking teacher licensure.

Eastern Oregon University (EOU), one of the partner schools at the Cascades Campus, has announced that they are withdrawing their MAT program from the Bend campus after the 2005-2006 cohort has completed their program.

Data indicate that there is a strong need for a MAT program in Central Oregon. We have also received many inquiries in the past 4 months from students requesting to be put on our mailing list for application materials. The application list is now includes approximately 100 students and we have not yet started a recruitment program. We are confident that we will be able to fill a cohort of 20 - 25 students. Moreover, offering the MAT program will be a public service to Central Oregonians as it is difficult to obtain a degree of this nature via distance learning.

Resources:

The enrollment and fiscal data indicates that this program can be self-supporting and will likely produce significant income for OSU-Cascades campus. If, due to unexpected circumstances, we are unable to enroll a cohort of 20 - 25 students, we will admit 15-18 students and still be able to cover our expenses. Tuition revenue was calculated on the basis of graduate tuition assessed for AY 2004-05.

Library resources are available at the OSU-Cascades campus and the EOU resources will remain. In addition, the OSU Education Double Degree program has teacher educational material that will be available for the MAT program. Many of the teacher education library resources are on-line and available from the OSU-Corvallis campus. The program

coordinator in Bend has discussed the library resources with the education librarians at the Bend and Corvallis campuses.

Admissions, Scheduling and Logistics:

All OSU admissions policies and procedures will be followed. The MAT curriculum will be replicated without any deviation from the National Council for Accreditation of Teacher Education (NCATE) accredited program offered on the Corvallis campus. Admission process for students will include the same procedures as the OSU main campus. The attached schedule of classes demonstrates the replication of the approved MAT program offered in Corvallis.

The Corvallis campus and Bend campus faculty who administer and teach in the MAT program have worked together very carefully to ensure that the programs at both campuses are equitable and both exceed the national and state accreditation standards. The program will follow the Elementary Education graduate curriculum and provide licensure in two authorizations. Along with attaining a masters degree, students will be able to acquire licensure in the elementary authorization (grade 3 through grade 8) and either the early childhood elementary authorization (age 3 through grade 4) or the middle school authorization (grade 5 through grade 9). As there is a state and national need for high school teachers, especially in the areas of mathematics and science, we are hoping to add the high school authorization in the near future.

Programmatic Ability to Comply with Graduate Council and Graduate School Policies and Procedures:

The MAT program at OSU-Cascades will follow all policies and procedures that are in place on the main campus. Curriculum and courses are all identical to the MAT program offered on the main campus. All faculty members who teach in the MAT program will be eligible for and be nominated for membership in the Graduate College. The OSU-Cascades campus will be hiring at least one more Education faculty member to teach in the MAT program.

OSU Libraries Support of the MAT Degree at Cascades

OSU Cascades Library Services

The OSU Libraries provide services for the Cascades campus in collaboration with the COCC Library. Two OSU Cascades librarians provide reference and instruction services tailored for Cascades students. Circulation is handled by COCC staff, and interlibrary loan is provided by OSU.

Budget and Print & Video Collection

The local library education collection in print and video is combined with the COCC Library collection and it has shown considerable growth in the last 2 years. Cascades spent \$2,890 towards the purchase of education books and videos in 03-04, and increased that to \$5,404 in 04-05. In each of these years Cascades has also contributed \$1,994 to the purchase of the online database *Education Full Text*, a subscription it shares with OSU main campus. Main campus library print and video materials are delivered to Cascades within 2-3 days. In 2003, OSU education subject librarian Paula McMillen wrote an assessment of OSU education holdings for the dual degree program. Please see file *Cat 1 Education Dual Degree.doc* for an in-depth analysis of this collection.

In addition to the branch library and the OSU main collection, the Summit catalog (<http://summit.orbiscascade.org>) provides noteworthy access to education books and videos. Summit includes the collections of over 30 academic libraries in Oregon and Washington. Twenty of these libraries are at other institutions offering masters degrees in education, and eight of these offer doctorates in education. Summit materials are brought to the Cascades campus by courier and are generally available within 2-3 days of being requested. Books and videos that are not available through Summit can usually be borrowed through the *WorldCat* catalog which provides access to hundreds of libraries in the United States and to some foreign libraries.

Journal Collection

Through the OSU Libraries the Cascades campus has immediate access to hundreds of electronic journals in education and related areas. (See <http://mw8xt6bj7r.search.serialssolutions.com/?V=1.0&L=MW8XT6BJ7R&S=SC&C=SO> for journal title lists under education categories.) Journal articles can be requested through the OSU catalog from journals in print format. Requested articles are scanned and posted to the web in 2-3 days, and the user is notified via e-mail. Articles that are not held at OSU are available from other libraries via Interlibrary Loan, and the average turn around time is 6 days. There is also a small number of subscriptions to print journals locally, such as *Educational Leadership*, *Harvard Educational Review*, *Instructor* and *Journal of Developmental Education*.

Reference

OSU subscribes to the online version *the Encyclopedia of Education* by Gale (2003) which provides comprehensive coverage of all aspects of education. The local print collection includes other education encyclopedias and dictionaries, such as *Encyclopedia of Special Education* (2003), *Encyclopedia of World Education* (2002), *Greenwood Dictionary of Education* (2003), and *Learning Theories A-Z* (2002). All volumes of *Mental Measurements Yearbook* and *Tests in Print* are available.

Databases

Cascades students have access to the same research databases available to main campus. *ERIC*, *Education Full Text*, and *Professional Development Collection*, *PsycINFO*, *Psychology & Behavioral Sciences Collection* are key databases for education literature. *Social Science Citation Index* via *Web of Science* is critical for tracking citations.

Library Assessment: Bachelor of Arts/ Bachelor of Science in Education
March 2003

Paula McMillen, Ph.D., Social Science Reference Librarian, The Valley Library

Background:

OSU's School of Education currently offers an undergraduate degree (B.S.) in Technology Education, and graduate degrees in Adult Education (Ed.M.), Counseling (M.S., Ph.D.), Education (Ed.M., M.S., Ed.D., Ph.D.), and Teaching (Ed.M., M.A.T.). The proposed addition of an undergraduate degree in education would seem, at first glance, to offer no extraordinary demands on library resources that support higher level programs. Several concerns are raised, however, by the anticipated increase of students utilizing education resources in the library and from a distance (an estimated "500 students—Corvallis campus plus OSU-Cascades campus-- participating in the program within five years" according to the proposal, p.10).

The major costs/concerns related to providing library services/ resources include:

- The increased use of interlibrary loan services to provide materials (books and journal articles) not currently held by the Valley Library
- The increased support services for distance education users which include librarian time for on site or online instruction and phone consultation; costs for delivering materials owned by the Valley Library to distance education students; costs of providing greater online access to full-text journals.
- The current lack of a Curriculum Materials Collection in the Valley Library
- The increased instructional load for the librarian supporting the School of Education.
- Cost of purchasing, on a regular basis, more copies of the study guides for teacher exams required for Provisional Admission into the program (CBEST) and for Professional Admission into the program (subject based PRAXIS exams). Cost is estimated at \$400-\$500 annually)

The Valley Library's Current Holdings

Monographs

The most recent comprehensive assessment of the library's education holdings was completed in 1999, so it is somewhat dated. At that time, it was found that the median age of book collections for specific areas within education ranged from the 1950's for areas such as Child Study and General Education to the 1980's and 90's for Computer Assisted Instruction and Intercultural Education. The most positive finding was that 21% of book holdings were published within the last 10 years, meeting national standards of currency for libraries supporting doctoral level education programs.

Specific title comparisons for "core" holdings in education showed that we held 63% of titles in the *Core list of books and journals in education*, published in 1991. This is sufficient to support master's level study according to national benchmarks.

For this assessment, two more recent bibliographies, were used to compare holdings on a title by title basis.

The educator's desk reference (Freed et al, 2002).

This work “seeks to facilitate educational research [by identifying] both traditional and electronic sources of information.” (p.ix) Given the emphasis on research articulated in this new program (Action Research ED 433 required for Professional Education component of both Adult and Youth Development pathways; “contributing to research” as an explicit outcome of the learning experience, and a capstone project which includes a research review), this seems an appropriate benchmark for library holdings. The Valley Library owns approximately 62% of the reference titles in this bibliography (see Table 1 for a more specific breakdown of material types). Because this is a bibliography of basic reference sources, which are not usually available through interlibrary loan, the library should probably own about 75% of these titles.

Table 1

Material Category	# titles owned by Valley Library/ # titles in Freed, et al	Percentage of titles owned by Valley Library
Bibliographies	11/21	52%
Biographical Information	1/1	100%
Research, Statistics, Measurement	5/10	50%
Dictionaries & Thesauri	4/9	44%
Directories	28/35	80%
Encyclopedias & Handbooks	10/20	50%
Indexes & Abstracts	18/26	69%
Miscellaneous	4/11	36%
Statistical Digests & Sources	7/8	88%
Yearbooks	2/4	50%

Education: A guide to reference and information sources (O'Brien, 2001)

“The purpose of this guide is to provide information about the key reference and information resources in the field of education.” (p.xi) Students are included as part of the intended audience. Selected subject areas within education were compared (see Table 2 for detailed figures). Overall, the Valley Library holds approximately 69% of the titles in these areas. Because this is a bibliography of largely reference titles, our holdings should be closer to 75%.

Table 2

	# of titles owned by Valley Library/# titles in O'Brien	Percentage of titles owned by Valley Library
General Education	39/64	61%
Early Childhood, Elem. &	11/16	69%

Secondary Ed.		
Multilingual & Multicultural Ed.	6/6	100%
Adult, Alternative & Continuing Distance Ed.	4/8	50%
Career & Vocational Ed.	2/2	100%
Curriculum, Instruction & Content Areas	15/16	94%
Educational Psychology	4/4	100%
Educational Technology & Media	4/10	40%
Educational History & Philosophy	2/5	40%
Educational Research, Testing & Measurement	11/12	92%

There is a modest Children's Literature collection (ca. 4,000-5,000 thousand books) which is currently budgeted at \$840 per year. The focus for this collection has been on national award winning books, multicultural materials (although few in languages other than English) and books used in support of various courses, such as the Theories and Techniques of Counseling (COUN 552).

Overall, the circulating collection is adequate to meet the needs of education students either through the Valley Library's holdings or limited interlibrary loan services. However, our reference collections need to be supplemented with key titles and with study guides for the two sets of examinations required for the undergraduate education students.

Journals

In 1999, the assessment found the Valley Library owned or provided access to 52% of the journal titles from the "Education and Education Research" and "Education, Special" areas of *SSCI Journal Citation Reports*, the standard source for doing citation analysis and assessing the impact of particular journals in the fields covered. We held 76% of the titles identified in *Core list of books and journals in education* (1991). This benchmarks our journal collection at a level to support lower division and upper division undergraduates, respectively, for the two areas.

Again, a comparison to more current bibliographies was done. The Valley Library provides either a print subscription or electronic access to approximately 68% of the journal titles in *The educator's desk reference* (Freed, et al., 2002) and to approximately 70% of the titles in *Education: A guide to reference and information sources* (O'Brien, 2001. See Table 3 for more detailed analysis).

Table 3

	# of journals at Valley	Percentage journal titles
--	-------------------------	---------------------------

	Library/# of journals in O'Brien	owned/ provided by Valley Library
General Education	29/42	69%
Early Childhood, Elem. & Secondary Ed.	10/12	83%
Multilingual & Multicultural Ed.	8/13	62%
Adult, Alternative & Continuing Ed.	6/7	86%
Career & Vocational Ed.	5/11	45%
Curriculum, Instruction, & Content Areas	28/36	78%
Educational Psychology	9/14	64%
Educational Technology & Media	7/10	70%
Educational History & Philosophy	5/7	71%
Educational Research, Testing & Measurement	14/22	64%

In addition, our journal holdings and/or electronic access to full-text journal literature were compared to the titles currently indexed in *Education Abstracts*, one of the two major electronic indexes to educational research journals. Of the 464 titles currently indexed, approximately 271, or 58%, are available in print or electronically through the Valley Library. **This places our journal collection at only a 3a level on a national conspectus, adequate to support lower division undergraduate study.**

The demand for and potential access to online versions of research journals has increased dramatically over the last few years. In order to ensure access to older materials, the library often has to purchase both print and electronic subscriptions to key journals in the field. Given the double digit annual increases in the average cost of journal subscriptions, and the single digit or even negative changes in the library's budget in the last 5-6 years, it is not surprising that we have had to cut our journal holdings almost every year since 1997.

Our journal access should be brought to at least a 3b conspectus level, adequate to support upper division undergraduate study; that is, we should own or have full-text access to 75% of the titles in *Education Abstracts*. This means purchasing or providing access to an additional 77 titles. This goal could be reached in large part through purchase of the *Education Full-Text* database, which currently costs \$6,248. Any additional acquisitions can only be estimated based on the 2002 American Library survey of journal prices which places education titles at approximately \$147 per year (<http://www.ala.org/online/archive/periodicals02/2002perpricestable1.html>). Further analysis is needed for an exact cost.

Additional Electronic Resources

The library provides two major education indexes in electronic form: *Education Abstracts* and *ERIC*. We have for the last 3 years purchased a separate subscription to full-text of a subset of the *ERIC* database, *ERIC* documents published between 1996 and the present. These subscribed products are available to off-campus students through a proxy server maintained by the library. Through several other database vendors (e.g., EbscoHost's *Professional Development Collection* and *Academic Search Elite*), we also provide online access to recent years of dozens of education related journals (see discussion above). Due to cost and service considerations, we are at present considering dropping our access to *ERIC* documents online (\$1,752 per year) as well as limiting access to some lower-use databases in order to purchase additional access to full-text journal articles through *Education Full-Text*. Although this would increase online access to educational journal content, it comes at the cost of reduced access to curriculum materials (classroom guides, etc. available in *ERIC* documents).

One way to offset some of the reduced online access to curriculum materials would be to purchase *Kraus Curriculum Development Library (KCDL)* in a web-based version; the annual cost for this service is currently \$1,850. Ideally, we would provide access to both of these online curriculum collections, but, if a choice must be made between the two products, service issues would favor the *KCDL* product at this time.

Other Formats

The Valley Library has microfiche holdings of the complete *ERIC* document collection. We also hold the *Kraus Curriculum Development Collection* in microfiche as well as Educational Testing Service's *Tests in Microfiche* collection.

Curriculum Materials

The Valley Library has not had, in recent memory, a budget for, separate location, or collection plan for curriculum materials, other than research based books and a children's literature collection. There is a somewhat dated assortment of student and teacher versions of subject based textbooks covering the last several decades. This is a selective, not a comprehensive collection, accumulated primarily from faculty donations. The proposed undergraduate teaching degree highlights the lack of a formal Curriculum Materials Center (CMC) for several reasons. In the past, students participating in the M.A.T. program were already involved in school settings, often as student teachers, with, presumably, ready access to whatever materials were being used in their district. And, in fact, past accreditation reviews, when noting the lack of a CMC either in the library or school of education, were told that the program relied on the resources of the school districts. This is of concern because undergraduate students will likely have access to such district based materials only during their student teaching. Additionally, school districts themselves have been affected by significant state budget cuts and curriculum materials purchase is likely to be reduced. The other OUS institutions which have undergraduate education programs, University of Oregon, Eastern Oregon University, and Western Oregon University, all have some level of CMC's, either within their library or situated in the education schools. This year, the Association of College and Research Libraries, in conjunction with the American Library Association, issued a new set of guidelines for CMC's in academic institutions supporting teaching programs (<http://www.ala.org/acrl/guides/cmc.html>). The document recommends a collection

framework, levels of service and access, space and equipment requirement, staffing levels and budget parameters, but not specific numbers of items or budget figures.

The costs of establishing a CMC in the Valley Library would include not only the purchase and cataloging of materials, but also providing secure storage (due to the nature of many instructional materials) and personnel to provide access to, and assistance with the materials. To the extent that such materials would be reviewed onsite, costs would also include equipment such as video monitors and computers to run software.

Often connected to CMC's are collections of educational tests. The Valley Library does not have such a print collection, although we do provide several indexes to tests and publishers in our education reference collection. There is a microfiche collection of tests from Educational Testing Service, and students can get selected test materials through their faculty from the Northwest Regional Education Library.

Interlibrary Loan Services

Much of the burden for providing access to materials – books, journal articles, theses, videotapes, etc.—that are not owned by the Valley Library falls to the Library's Interlibrary Loan services. Any increase in classroom curriculum which involves the use of research materials will increase the use of ILL services. At present, the library subsidizes the total cost of borrowing materials which can range from a few dollars, to \$40 or more. At an average cost of \$14 per transaction, the cost of providing ILL services for just those education materials within the "L" call number range for the last 2 calendar years are as follows:

Table 4

Year	Monographs	Journal Articles	Total
2001	151 x \$14 = \$2,114	269 x \$14 = \$3,766	\$5,880
2002	176 x \$14 = \$2,464	212 x \$14 = \$2,968	\$5,432

Some of the decreased journal activity may be due to increased access to full-text of education journals through our database subscriptions. The borrowing of book materials does not include the transaction costs of processing materials obtained through our regional borrowing/ purchasing consortium, Orbis.

Instructional services

Utilization of librarian instructional and consultation services has increased over the last several years, from 14 class sessions taught in 1999 to 22 class sessions taught in 2002. Classes have been taught both on the Corvallis and Bend campuses, as well as at distance sites for adult education and community college program cohorts. More students in classes that have curriculum which rely on library materials inevitably means more instruction, either in group/ class or one on one settings.

Distance education student support

Distance students in particular often require substantially more support due to their unfamiliarity with the library's resources and the necessity of going through additional service points to get materials. Using resources from a distance means additional technological hurdles, as well, and these concerns often are mediated through the reference desk, access services, library technology, or subject specialist personnel. This is particularly true since the position of distance education & outreach librarian which was vacated last August has not been refilled. The Cascades campus librarian has assumed some of the liaison responsibilities but the workload has also increased for the other library service areas as a result. Increasing the number of distance education students as this program proposes will require increased support from the library in terms of staff time for developing and maintaining online instructional materials, increased costs associated with delivering materials, increased use of ILL services, increased phone consultation for technology and research issues, and a portion of the costs from providing more online access to education journal content.

Summary

The Valley Library and the School of Education have enjoyed a collaborative and mutually supportive relationship for many years. The library and its personnel strive to support not only the education students on campus but also the large number of distance education students in education courses in a way that helps them integrate a research-oriented approach into their life's work. The Valley library's circulating monographic (book) collection is adequate to support this new program, based on the 1999 collection assessment. This recent assessment suggests that our reference books should be supplemented. Our journal holdings have been and continue to be inadequate to support education students beyond lower division undergraduate study. We have dealt with this historically by subsidizing interlibrary loan access to materials not owned/provided by this library. As is clear from the ILL statistics, we often have to rely on borrowing materials from other libraries in order to meet the information needs of current education students. We have also endeavored to provide increased levels of electronic access to education related material, e.g., journal articles and classroom teaching guides, in response to student and faculty demand, both on and off-campus. There is a cost for providing information, whether it is electronically or in print. A significant increase in the number of students using education resources means a significant increase in our costs to meet their information needs. Aside from the actual cost of materials, there is the associated cost of personnel to provide services related to accessing and effectively using library resources, such as interlibrary loan, materials delivery, reference and instruction. Because library staffing is already so lean, it is not realistic to expect the same levels of service for increasing numbers of students without accompanying increases in personnel. Actual costs can only be approximated since changes in technology, products, and even the number of students cannot accurately be predicted.

Recommendations

Suggested augmentations to resources:

- Refill the distance education and outreach librarian position, and/or hire a full-time education librarian. Minimum cost for 1 additional librarian: ca \$56,400 (includes benefits at 41% of salary)
- Purchase reference materials to reach 75% level of titles in current bibliographies. More detailed analysis is needed: ca. cost \$1,455.30 (30 titles x \$48.51 per Blackwell's cost study of June 30, 2002)
- Purchase *Education Full-Text* database: cost ca. \$1,600 over and above cost of dropped databases
- Purchase journals not covered by *Education Full-Text* in designated areas as identified by O'Brien (2001) and/or from *Education Abstracts* sufficient to bring us to a 3b (supports upper division undergraduates) level on national standards. Cost estimate requires more detailed analysis, but an outside estimate would be 77 additional titles at \$147 each = \$11,319.
- Purchase access to *Kraus Curriculum Development Library* online: ca \$1,850
- Renew subscription to *ERIC* documents electronic access when service reliability improves: ca \$1,752
- If no additional journal titles are purchased, we must increase funds for interlibrary loan services. An estimate would be to increase current expenditures by the percentage increase in number of education students: 100 new education students per year /406 current students in SOE. (Current estimate of students in the School of Education is based on a personal conversation with Dean's office 3/13/03). Admittedly undergraduates probably do not use ILL services at the same rate as graduate students, but this is a 25% increase in the number of students for the 1st year alone. $\$5,432 \times .25 = \$1,358$.
- Increase funds for Children's Literature collection to \$1,000 per year: ca. \$160
- Develop a CMC within the institution, either at the Valley Library or in the School of Education, with designated secure storage and access space, appropriate equipment and designated personnel to staff the center. Materials should be cataloged so that distance education students can locate and request them. Funding would need to be provided for mailing materials to distance students as well. Funds would be required for annual updates of materials. Cost estimate requires more detailed analysis.

ABBREVIATED CATEGORY I PROPOSAL

PROPOSAL TITLE: Name changes for degrees and minor in Health Promotion and Education

Oregon State University
College of Health and Human Sciences
Department of Public Health
CIP number: 51.2207

Date of Proposal: April 29, 2005

Proposed Effective Date or Term: Fall 2005

A. Title of the proposed instructional, research, or public service unit. For name changes, give both the current and proposed names. Describe the reason(s) for the proposed change.

The current and proposed names are indicated below, followed by a description of the reasons for the proposed change.

Current Name	Proposed Name
B.S. Health Promotion and Education	B.S. Health Promotion and Health Behavior
Undergraduate Minor in Public Health Promotion and Education	Undergraduate Minor in Health Promotion and Health Behavior
M.S. Health Education	M.S. Health Promotion and Health Behavior

Currently, the health promotion degree names at the bachelor's through doctorate level are different, reflecting the evolution of our program and the profession over time. As new degree programs were added over the years, their names reflected the current national philosophies and practices in our field. Essentially, we have evolved from the early days in which our programs were titled as "health education programs" and had strong school health and educational methods elements, along with a solid emphasis on social and behavioral factors affecting health, to the "health promotion" name that emerged as a national standard in the 1980s and 1990s. Early health promotion programs had a much greater emphasis on community health and social and behavioral strategies designed to promote health and prevent premature death and disability. Our programs have not focused on school health education for the last 10 years. Faculty, curriculum and related research have evolved to focus on more comprehensive community-based health promotion programs and the application of behavioral theory in reducing health risks.

Given this focus and the need to streamline our programs, we recently eliminated (1) the Health Education Teacher Training concentration in the MS in Health Education degree program; and (2) the "Child and Adolescent Health" option of the undergraduate major, which focused on pedagogy and health teacher training. The undergraduate option and MS concentration, in combination, were for students who wanted to teach health in schools. There is a new double degree in Public Health and Education offered, so students who want to be health teachers can complete the double degree. With the double degree, students will receive their initial teaching license and will be able to begin teaching right after graduation. An additional advantage for students is that

they will graduate with two degrees, which should give them an edge in the job market. Memos from the Department Chair notifying students and professionals about these changes are attached.

With the recent discontinuation of the MS in Health Education Teacher Training and the undergraduate option in Child and Adolescent Health, our programs are now exclusively focused on health promotion and health behavior in communities. Thus, the proposed names for the undergraduate major and minor, as well as the M.S., more accurately reflect the curriculum and the skills and knowledge base that our students gain in these degree programs.

Importantly, “Health Promotion and Health Behavior” is consistent with comparable programs in the majority of Schools of Public Health throughout the United States. For example, the name of the department at the University of Michigan’s School of Public Health is *Health Behavior and Health Education*. At the University of North Carolina at Chapel Hill’s School of Public Health, the name is *Health Education and Health Behavior*. At the University of South Carolina’s Arnold School of Public Health, it is *Health Promotion Education and Behavior*. For your information, as suggested above, Health Promotion is the broader term and includes Health Education.

Another example of how the name and focus of our field has changed over time is the names of the journals. In the late 1990s, the Society for Public Health Education (SOPHE) changed the name of its official publication from *Health Education Quarterly* to *Health Education & Behavior*. In addition, SOPHE’s newest journal – published since 2000 – is titled *Health Promotion Practice*.

We have already changed the name of our PhD concentration to “Health Promotion and Health Behavior.” We recently changed the name of our MPH track to “Health Promotion”; it is necessary for our MPH track and our sister MPH track at PSU to share the same name, and “Health Promotion” is the name we jointly adopted. With the proposed names changes, all of our degree programs will have the same name, except the MPH track. Thus, the proposed changes will also increase consistency in the names of our degree programs, which is also a desirable outcome.

B. Location within the institution’s organizational structure. Include “before” and “after” organizational charts (show reporting lines all the way up to the Provost).

Not applicable. These degrees are offered by the Department of Public Health in the College of Health and Human Sciences. There is no proposed change in organization structure or function.

C. Objectives, functions (e.g., instruction, research, public service), and activities of the proposed unit.

Not applicable.

D. Resources needed, if any: personnel, FTE academic, FTE classified, facilities and equipment.

1. Not applicable.
2. The Health Promotion and Health Behavior faculty are requesting these name changes. The Department of Public Health faculty approved the changing of our program’s name, as well as the names of our degrees, to “Health Promotion and Health Behavior” at the January 26, 2004 faculty meeting (the submittal of this proposal was postponed until the re-naming of our MPH track, which was a decision jointly made with the Health Promotion faculty at PSU, was final; see above). The undergraduate academic advisors are also supportive of these changes (see attached e-mail).

E. Funding sources: state sources (institutional funds – state general fund, tuition and fees, indirect cost recoveries), federal funds, other funds as specified.

1. Not applicable.

2. Not applicable.
3. This proposal requires no additional funds (see attached budget).

F. Relationship of the proposed unit to the institutional mission.

1. Not applicable.
2. We have not identified any potential negative impacts of the proposed name changes. As noted above, the positive impacts are (a) degree names that better reflect the curriculum and the skills and knowledge base that our students gain, (b) degree names that are consistent with comparable programs at other institutions, and (c) greater consistency in the names of degrees offered by the Health Promotion and Health Behavior program in the Department of Public Health.

G. Long-range goals and plans for the unit (including a statement as to anticipated funding sources for any projected growth in funding needs).

Not applicable.

H. Relationship of the proposed unit to programs at other institutions in the state.

Not applicable.

I. If the program is professionally accredited, identify the accrediting body and discuss how the proposed change may affect accreditation.

The undergraduate program is approved by the SOPHE/AAHE Baccalaureate Program Approval Committee (SABPAC), a voluntary credential for undergraduate professional programs in health education. There will be no effect on accreditation.

J. Disability access.

Disability access has been considered and accommodations can be made for full inclusion both for the built and instructional environment.

APPENDICES

Transmittal Sheet: Original with signatures provided separately.

Budget Table: Provided in separate document.

Library Evaluation: Not applicable

Liaison: Correspondence with the following individuals is attached:

Subject: RE: Follow up from 4/26

Hello Sheryl,

I spoke with Carey, and she had a similar reaction to the name that I did. Logistically it's longer than what we currently have-that's a doable challenge. Apparently the name change had been mentioned years before, so it wasn't a surprise to Carey.

We both agree that it better reflects the content of the major. We do not see this having adverse impacts on our students, instead we feel that it will allow the students to better express their knowledge base to employers. We are in support of the name change.

Please let me know if there's more specifics that I can provide for you.

Karen

Dear Sheryl,

I have no concerns regarding the change of names in your B.S., minor, or M.S. programs. Thanks for the update and for soliciting input.

Best,

Stephanie

Subject: Liaison regarding Name changes for degrees and minor in Health Promotion and Education

Stephanie --

I am writing regarding the Abbreviated Category I Proposal we are submitting to change the names of our B.S. in Health Promotion and Education, our undergraduate minor in Public Health Promotion and Education, and our M.S. in Health Education. We propose to change the names of these majors/minors to "Health Promotion and Health Behavior." Of course, the name of our MPH track will remain Health Promotion. Because you are the Track Coordinator for PSU's Health Promotion track of the OMPH program, I wanted to formally give you the opportunity to provide input and/or comment on these changes, etc. So, please let me know if you have any questions or concerns about the proposed name changes.

Thanks, Sheryl

Subject: Liaison regarding Name changes for degrees and minor in Health Promotion and Education

Hi, Liana --

Thanks again for a great event on Friday - I think the OMPH Student Symposium was a success!

I am writing regarding an Abbreviated Category I Proposal we are submitting here at OSU. The proposal is to change the names of our B.S. in Health Promotion and Education, our undergraduate minor in Public Health Promotion and Education, and our M.S. in Health Education to "Health Promotion and Health Behavior." I think you already know that we have changed the name of our PhD concentration to "Health Promotion and Health Behavior." Of course, the name of our MPH track will remain Health Promotion.

I wanted to let you know about the proposed changes and to give you the opportunity to provide input and/or comment on these changes, etc. As Director of the Oregon Master of Public Health Program (OMPH), do you have any questions or concerns, or see any potential problems for the OMPH resulting from the proposed changes? Please let me know if you have any questions.

Thanks, Sheryl

Hi Sheryl,

I have reviewed the Abbreviated Category I proposal for a name changes for degrees in the Department of Public Health. I am supportive of the proposal and appreciate the work of your department to facilitate the transition from the preparation of health education teachers through the former MS in Health Education degree program to the Education Double Degree. I understand that your department will work closely with the College of Education to advise undergraduate Health Promotion and Health Behavior students about the opportunity to pursue the Education Double Degree with a focus in health education.

Best,
Sam

Subject: Curriculum Liaison

Sam --

The attached Abbreviated Category I proposal describes a proposed name change to the B.S. in Health Promotion and Education, the undergraduate minor in Public Health Promotion and Education, and the M.S. in Health Education.

In accordance with the liaison criteria in the Curricular Procedures Handbook, this memo serves as notification to your College of our intent to make this curricular change.

Please review the attached materials and send your comments, concern, or support to me by June 8th. I apologize for the short amount of time for review. The proposal, however, is not lengthy. Please let me know if you cannot make that deadline.

Please note that a lack of response will be interpreted as support.

Thank you for your time and input.

Sheryl

TO: Professional Colleagues in Health Education and Teacher Training

FROM: S. Marie Harvey, Chair
Department of Public Health

RE: Department of Public Health's Teacher Training Concentration in the Health Education MS Program

I write to inform you that effective Fall 2005 the Health Education Teacher Training concentration in the Health Education MS degree program in Department of Public Health will be phased out. The Department of Public Health will continue to offer graduate programs leading to an MS in Health Promotion and Education, and an MPH and PhD in Public Health with concentrations in Health Promotion and Education. Additionally, our undergraduate program in Health Promotion and Education will continue to prepare students for careers in a diverse range of health-related fields including school health education.

Because of our commitment to the preparation of OSU students for professional teaching careers in health, I am pleased to announce the creation of a new joint degree program between the College of Health and Human Sciences and *the new* School of Education at Oregon State University. Beginning Fall 2004, students will be able to enroll in a double degree program where they will earn two degrees concurrently – a primary degree in Health Promotion and a secondary one in Education – in preparation for teaching health in middle and high schools.

This partnership between the two academic units will not only provide exciting options for students who want to teach health, but because they will receive their initial teaching license, the double degree will enable them to begin teaching right after graduation. As an additional advantage, students will graduate with two degrees, which should give them an edge in the job market. We are proud to be a partner in this double degree program and believe that this approach will better meet the needs of future health teachers and communities across Oregon.

Please feel free to contact me at mharvey@oregonstate.edu or (541) 737-3824, if you would like additional information about these changes.

TO: Undergraduate Students in the Department of Public Health

FROM: S. Marie Harvey, Chair
Department of Public Health

RE: Department of Public Health's Teacher Training Concentration in the Health Education MS Program

I write to inform you that effective Fall 2005 the Health Education Teacher Training concentration in the Health Education MS degree program in Department of Public Health will be phased out. The Department of Public Health will continue to offer graduate programs leading to an MS in Health Promotion and Education, and an MPH and PhD in Public Health with concentrations in Health Promotion and Education. Additionally, our undergraduate program in Health Promotion and Education will continue to prepare students for careers in a diverse range of health-related fields including school health education.

Because of our commitment to the preparation of OSU students for professional teaching careers in health, I am pleased to announce the creation of a new joint degree program between the College of Health and Human Sciences and *the new* School of Education at Oregon State University. Beginning Fall 2004, students will be able to enroll in a double degree program where they will earn two degrees concurrently – a primary degree in Health Promotion and a secondary one in Education – in preparation for teaching health in middle and high schools.

This partnership between the two academic units will not only provide exciting options for students who want to teach health, but because they will receive their initial teaching license, the double degree will enable them to begin teaching right after graduation. As an additional advantage, students will graduate with two degrees, which should give them an edge in the job market. We are proud to be a partner in this double degree program and believe that this approach will better meet the needs of future health teachers and communities across Oregon.

The College of HSS will be hosting an Open House for students interested in the double degree program on Tuesday, May 25th from 5:00 to 6:00 pm in Milam 215. Karen Kvidt, Advisor for the School of Education will be available to answer questions. In addition, please feel free to contact me at mharvey@oregonstate.edu or (541) 737-3824, if you have questions or would like more information about these changes.

OREGON STATE
UNIVERSITY

Category I Proposal Transmittal Sheet

Submit proposals to: Office of Academic Programs
110 Kerr Admin -- Oregon State University

For instructions, see <http://oregonstate.edu/dept/academic/cph1998/>. Please attach Proposal, Library Evaluation (performed by the library), Liaison Correspondence, Faculty Curriculum Vitae, and Budget Sheets, as appropriate.

Check one:

Full Proposal

- ☐ New degree program
- ☐ New certificate program or administrative unit
- ☐ Major change in existing program
- ☐ Establishment of a new College or Department

Abbreviated Proposal

- ☒ Rename of an academic program or unit
- ☐ Reorganization – moving responsibility for an academic program from one unit to another
- ☐ Merging or splitting an academic unit
- ☐ Termination of an academic program or unit
- ☐ Suspension or reactivation an academic program or unit

For proposals to establish a new center or institute, contact the Research Office (737-3437).

For requests to offer existing certificate and degree programs at new locations, use the New Location Request Form available on the Web: <http://www.ous.edu/aca/aca-forms.html>

Title of Proposal:

Effective Date:

Graduate Certificate in Health Management and Policy

Fall 2005

Department/Program:

College:

Public Health

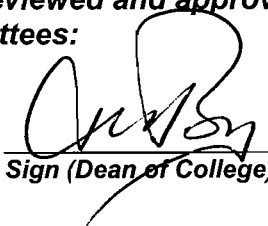

Health and Human Sciences

I certify that the above proposal has been reviewed and approved by the appropriate Department and College committees:

**Proposal to Change the Name of the
Graduate Certificate in Health Care Administration to
Graduate Certificate in Health Management and Policy**

Oregon State University
Department of Public Health
College of Health and Human Sciences
CIP 510701
03 May 2005
Proposed Effective Date: Fall 2005

A. Title of propose instructional, research, or public service unit. For name changes, give both the current and proposed names. Describe the reason(s) for the proposed change.

Current Name: Graduate Certificate in Health Care Administration

Proposed Name: Graduate Certificate in Health Management and Policy

Reasons: The term Health Care Administration does not adequately describe the scope of professional opportunities and preparation our students receive. Health Management and Policy is a much more accurate reflection of the curricular requirements for our students. We seek to change the name of the Graduate Certificate to bring it in line with our MPH (track concentration in Health Management and Policy) and PhD (emphasis in Health Management and Policy). Concurrent with this proposal is one that seeks to change the name of the BS in Health Care Administration to Health Management and Policy.

B. Location with the institution's organizational structure. Include "before" and "after" organizational charts

N/A

C. Objectives, functions, and activities of the proposed unit

There will be absolutely no change in course offerings, admission requirements, program requirements, student learning outcomes and experiences, or advising structure and availability.

D. Resources needed, if any: personnel, FTE academic, FTE classified, facilities and equipment

No additional resources will be needed to support this proposal. The proposed name change has been approved by and is fully supported by the faculty in the Department of Public Health, members of our external advisory committee, and program alumni.

E. Funding sources: state sources, federal funds, and other funds as specified.

Funds for this proposed name change will come from a reallocation of existing Department funds.

F. Relationship of the proposed unit to the institutional mission

N/A

G. Long-range goals and plans for the unit

The Graduate Certificate in Health Care Administration has been operational since 2004. In that time, this certificate program has served over 150 students across Oregon. The name change will not affect our prestige but will more accurately describe to current and future students and employers, that which our graduates can do.

H. Relationship of the proposed unit to other programs at other institutions in the State.

Aside from OSU, only OHSU/OGI offers a graduate certificate in health administration. That program wrote a strong letter of support for our initial program proposal

I. If the program is professionally accredited, identify the accrediting body and discuss how the proposed change may affect accreditation.

There is no certification or accreditation for graduate certificates in health management and policy.

(OUS and OSU)

Category I Proposal Budget Outline

Estimated Costs and Sources of Funds for the Proposed Program

Total new resources required to handle the increased workload, if any. If no new resources are required, the budgetary impact should be reported as zero.

See "Budget Outline Instructions" on the OUS Forms and Guidelines Web site: www.ous.edu/aca/aca-forms.html

Institution: Oregon State University

GRADUATE COUNCIL MEETING

October 20, 2005

3:00pm, Memorial Union Council Room

Present: Koenig (chair), Filtz, Francis, Gitelman, Harter, McLain, McMullen, Proebsting, Rettig, Rockey, Tadepalli, and Unsworth

Absent: Gupta, Pehrsson, Strickroth

Guests: Theo Dreher, Chair - Microbiology Department; Stella Coakley, Associate Dean – College of Agricultural Sciences; Frank Moore, Associate Dean – College of Science; Logen Logendran, Associate Professor - Department of Industrial and Manufacturing Engineering; John Bolte, Department of Bioengineering; and Chris Bell, Associate Dean – College of Engineering.

1. Report of the Microbiology Graduate Program Review

Logen Logendran (Industrial & Manufacturing Engineering) presented the report of the Microbiology Graduate Council Program Review to the Graduate Council in lieu of Dr. John Selker (Review Panel Chair) who was not available. The review, which was held in conjunction with an Undergraduate Academic Program Review, took place June, 2, 2005.

Logendran gave a brief overview of the review panel's findings including a summary of the department's strengths which include, a strong graduate program with satisfied students, excellent gender diversity in the student body, very good to excellent alumni support with generous gift giving, successful graduates with 90% of undergraduates and graduates receiving job placements in industry or in graduate programs and postdoctoral fellowships upon program completion, an established faculty with a highly successful academic research program enjoying a favorable reputation on campus and nationally.

Logendran then presented Council with the Review Panel's recommendations:

- It is **recommended** that the Department invest further effort toward the fleshing out of their strategic plan. Microbiology is a dynamic field with a rapidly evolving ensemble of key research questions, funding opportunities, and equally quickly changing market place for new employment. A strategic plan is essential in crafting the directions for the department and to insure full faculty buy-in for program adjustments that are inevitable given the economic climate and changing technologies and science. Strategic plans must address considerations regarding maintaining the strength in the undergraduate and graduate programs and service courses in the department and how faculty and funding allocations may need to address the current environment.

- It is **recommended** that the Department work to create a more cohesive graduate program through greater investment in communication and inclusion/integration of graduate students in the departmental operations. This could meet the graduate student concerns relative to course offerings, communication of requirements and equitable treatment. It could also lead to improved ability to recruit graduate students, necessary to support research in the Department.
- It is **recommended** that the faculty reexamine the graduate curriculum. A core curriculum of stand alone graduate courses for graduate students that meets diverse interests could be accomplished, with a one-year sequence of common courses including history, genomics, microbial genetics and physiology, bioinformatics, ethics, seminar, research methods, and grant writing, and a synthetic perspective on the interconnections between the diverse branches. Offering courses which appeal to other graduate students in biologically related programs could create a critical mass of students to fill courses and to provide a community of peers that will nurture mutual support and sharing of ideas.
- It is **recommended** that the Department continue its requests to the College of Science to replace the Graduate Teaching Assistant positions that have been lost but are needed for teaching labs in the undergraduate service courses. This is a critical and relatively low cost investment in assuring that the program can achieve the mission of excellence in education as the University continues on a path of increasing undergraduate enrollments. Recognition of the need to support many complex laboratory courses is needed at the college level if this program is to retain its outstanding reputation for undergraduate education.
- It is **recommended** that the Department and College Administration determine a means to provide durable commitment to the Instructor faculty within the Department. These important faculty members deserve to have some reassurance of commitment to continued support by the Department. They are critical to the success of the Department in providing strong advising, teaching and mentoring of undergraduate students.
- It is **recommended** the department begin efforts at directed fund-raising with the help of the OSU foundation. The University is starting a huge fund-raising campaign (to include bioinformatics) and the microbiology department can offer other ideas (new BL-3 lab, renovated labs, research positions). The interaction with the Foundation might also identify some opportunities for department-specific fund-raising efforts (scholarships, undergrad research funds).

Logendran called for questions.

Michael Unsworth (Oceanic & Atmospheric Sciences) asked Logendran to clarify his statements regarding the difficulty of establishing Microbiology core courses.

Logendran and Theo Dreher (Microbiology) contributed that the research areas of the Microbiology faculty and their students are so diverse that it would be difficult to select

“a best set of courses” that would make programmatic or academic sense to all. Logendran suggested that Microbiology work with the Colleges of Science and Agricultural Sciences to design a course or courses that would be useful to a large cross-section of graduate students in those units, thus achieving the needed critical mass (enrollment). Dreher agreed that the problem with Microbiology graduate student cohesion could be alleviated with the establishment of one or more core courses.

Dreher was then given the opportunity to respond to the Review Panel’s findings and recommendations.

Dreher told the Council that the Department of Microbiology participated in a one and one-half day retreat in September to discuss all the issues brought forward by the program review. Work was done to formalize the department’s Strategic Plan to maintain a diverse research program and to continue its strong support of undergraduate instruction. Discussion also focused on a new venture to seize fundraising opportunities by taking advantage of the Provost’s initiatives related to water and soil diseases. The Department generally agreed to the idea of building-up its water-borne infectious disease research program.

In regard to graduate student disenfranchisement, Dreher admitted that the Department was guilty of letting the graduate program slide in the recent past, due in part to frequent changes in leadership. Now, however, the Department is committed to re-building the feeling of community among the graduate students. Dreher described the recently instituted student/faculty “Fireside Chats,” the establishment of a student lounge and wireless network, the assignment of a graduate student representative to the Department’s Graduate Affairs Committee, and the move toward designing a core course or series of core courses. Dreher also mentioned the need to ensure that all instructors of slash 400/500 courses standardize the graduate component of the courses (primary literature presentations).

Dreher also informed the Council of the Department’s two faculty searches (one successful), and described the recent cosmetic renovations made to Nash Hall.

The College Deans were then given the opportunity to comment.

Frank Moore, Associate Dean of the College of Science, agreed with the Review Panel’s assessment that the Microbiology Department’s practice of using almost all of its resources to support its laboratory-intensive teaching program and of using its returned overhead to make up for budget shortages was unsustainable. He admitted that the use of research dollars to support teaching is a College of Science problem, originating from the budget reductions of the past several years.

Stella Coakley, Associate Dean of the College of Agriculture stated that the program review was fair, balanced, and productive. Then, in response to a comment made by Dreher, asked Sally Francis (Graduate School) if graduate students were permitted on graduate admissions committees. Francis replied that they are allowed and that many

programs do include them. Coakley stated that graduate student representation on all committees (including search committees) is often very helpful.

When asked for questions/comments, the Council asked for and received clarification on the following topics:

- The drop in applicant GRE quantitative scores and the panel's suggestion to recruit from non-traditional backgrounds.
- Decrease in Ph.D. enrollment and students leaving their graduate degree programs for lucrative jobs after earning an MS degree.
- Expectations of graduate students (desired learning experiences) and the production of research papers in various laboratories (different rates of production).
- Current relationship between Microbiology and Veterinary Science, and the difficulties with joint faculty appointments.

Francis then thanked Logendran for his work on the review and for presenting the Review Panel's report to the Council. The visitors were excused after thanking them.

A motion to accept the report was made by Tom McLain (Forestry) and was seconded by Teresa Filtz (Pharmacy). All voted in favor. The report will be forwarded to the Provost.

2. Minutes from the Meeting on October 6

The minutes from the Graduate Council on October 6, 2005 were approved as distributed.

3. Category I Proposal to change the name of the Department of Bioengineering and its Graduate Degree

John Bolte (Bioengineering) presented the reasons for the proposed name change. In so doing he alerted the Council of a modification to the previously submitted CAT I proposal.

The Council asked for clarification on the following issues:

- Liaison efforts.
- Comparison to College of Engineering's current undergraduate and graduate degrees in Environmental Engineering.
- Opportunities for professional licensure.
- Effects of the name change (and/or interim name change) on current students.

- Future changes in curriculum.
- Impact on students in other OSU programs.

When asked for comments, Chris Bell (College of Engineering) informed the Council that there exists strong collaboration between the Departments of Bioresource Engineering, Chemical Engineering, which offers the undergraduate degree in bioengineering, and Civil, Construction and Environmental Engineering, which offers degrees in environmental engineering. The College of Engineering and the College of Agricultural Sciences also collaborate well (Bioresource Engineering reports to the College of Engineering for its educational programs and to the College of Agricultural Sciences for its research and extension programs).

After the guests departed, the Council discussed the appropriateness of acting on the proposal given the modification that Bolte presented but which had not been incorporated into the proposal. Bruce Rettig (Graduate School) briefed the Council on the usual interface between the Curriculum Council and the Graduate Council in regard to CAT I proposals.

It was decided that a revised proposal would be requested of the Bioengineering Department before the Council would consider the issues. It was also decided that Departmental representation would not be required at the Council meeting when the proposal will be taken up again.

The meeting was adjourned at 5:33 PM.

Microbiology Department
PROGRAM REVIEW 2005
Graduate Council/Curriculum Council
Oregon State University

Executive Summary and Recommendations

The Microbiology Department is a highly successful academic research program that enjoys a favorable reputation within the Colleges supporting it (Science and Agricultural Sciences), the University as a whole, and its national peers. The Department actively participates in several interdepartmental programs, including the Linus Pauling Institute, the Environmental Health Science Center, the Center for Gene Research and Biotechnology, and the Molecular and Cellular Biology Program. The interdisciplinary collaborations expand the strengths and research breadth of the Department, providing intellectual stimulation for faculty and students alike as well as providing additional recruitment and research funding opportunities. The Department has a history of diversity within the field, including basic science as well as health and agricultural applications. Such diversity should be nurtured in the future for the research collaborations and teaching opportunities it provides.

Several members of its faculty have been recognized at various levels for their research accomplishments. The Department has both a solid undergraduate and graduate program offering B.S., M.S. and Ph.D. degrees. The faculty and staff and the programs make a substantial contribution to research and teaching at OSU; the prospect for future contribution is great.

The Department maintains a significant service to the undergraduate education mission of the University. It demonstrates a commitment to excellence in their offering and instruction of three non-major service courses. They have creatively incorporated the use of department undergraduate majors in assisting in teaching the laboratories for their service courses, serving to enhance the learning among the students majoring in Microbiology. They have clearly identified learning outcomes for all courses, routinely gather learning outcome assessment data, and utilize such to make improvements in courses and teaching.

Alumni satisfaction is generally high, as evident from exit surveys and generous gift giving to the department allowing for annual funding of academic scholarships. Graduating students appear to have a solid academic preparation including laboratory and/or research opportunities either in faculty labs or in field experience placements. Thus, they are finding suitable positions, with upwards of 90% of undergraduates and graduates receiving job placements in industry or in graduate programs and postdoctoral fellowships upon program completion.

The Department has a long history of successful graduate education as well. They currently enroll 25-35 MS and PhD students, with an equal male/female gender distribution but smaller racial ethnic diversity profile. While the outcomes of the graduate program generally mirror those of the undergraduate program, there are areas for improvement including course offerings, communication of program requirements, mentoring, and equitable treatment.

For many years, a strong series of focused leaders chaired the department (Paul Elliker, John Fryer, and Jo-Ann Leong). Since that time, the chair position has changed three times, occurring simultaneously with times of serious university economic downturn. It appears that the timing of these circumstances resulted in loss of effectiveness in crafting and executing a strategic and commonly held mission for the department, and attrition that has affected most departments at OSU. The current professorial and instructor faculty full time equivalents (FTE) are 13.6 compared to 16.5 in Fall 1999. In addition, the loss of Microbiology faculty to the department of Veterinary Medicine, perhaps in part due to opportunities for higher salary, has caused faculty frustration and disenchantment injuring Microbiology-Veterinary Medicine relationships. To fulfill the promise of an expanding Veterinary Medicine department, a strong basic Microbiology department is essential: a clear statement by the university administration defining this interdepartmental relationship is crucial.

Financially the Department has been forced to budget almost all available dollars on supporting its laboratory-intensive teaching program, including using returned overhead to make up the budget shortages. This is not a robust mechanism to depend on: Firstly, the research dollars garnered by the faculty is likely to change from year to year; and further, the long term success of the research effort depends upon reinvestment in high-cost equipment and bridging funds that should in principle come from returned overhead dollars. The entire tuition generated from summer course offerings is returned to the department, which, along with laboratory fees, has also been used to offset budget shortages. The budget reductions in the past several years have slowed the growth of the department, particularly in their ability to hire new faculty that can teach and perform research in emerging new areas in microbiology.

Under the current leadership of Theo Dreher, now less than a year in this position, the Microbiology department appears to be moving forward with remarkable new energy and unity. He is considered to be a good listener and open to shared governance; the faculty is supportive of the new chair and moderately optimistic about the future. The following recommendations are offered from the perspective of ensuring that the Microbiology Department's programs maintain its present high quality level and regain stability and cohesiveness among faculty and graduates.

Recommendations:

It is **recommended** that the Department invest further effort toward the fleshing out of their strategic plan. Several faculty members indicated that strategic plans were not useful without the opportunity to garner new monies, and that the current budget situation

defeats the need for strategic planning. We do not concur with this perspective. Microbiology is a dynamic field with a rapidly evolving ensemble of key research questions, funding opportunities, and equally quickly changing market place for new employment. A strategic plan is essential in crafting the directions for the department and to insure full faculty buy-in for program adjustments that are inevitable given the economic climate and changing technologies and science. Strategic plans must address considerations regarding maintaining the strength in the undergraduate and graduate programs and service courses in the department and how faculty and funding allocations may need to address the current environment.

It is **recommended** that the Department work to create a more cohesive graduate program through greater investment in communication and inclusion/integration of graduate students in the departmental operations. This could meet the graduate student concerns relative to course offerings, communication of requirements and equitable treatment. It could also lead to improved ability to recruit graduate students, necessary to support research in the Department.

It is **recommended** that the faculty reexamine the graduate curriculum. A core curriculum of stand alone courses for graduates that meets the needs of diverse interests could be accomplished, with a one-year sequence of common courses including history, genomics, microbial genetics and physiology, bioinformatics, ethics, seminar, research methods, and grant writing, and a synthetic perspective on the interconnections between the diverse branches. Offering courses which appeal to other biologically related graduate students could create a critical mass of students to fill courses and to provide a community of peers that will nurture mutual support and sharing of ideas.

It is **recommended** that the Department continue its requests to the College of Science to replace the diminishing number of Graduate Teaching Assistants needed for teaching labs in the undergraduate service courses. This is a critical and relatively low cost investment in assuring that the program can achieve the mission of excellence in education as the University continues on a path of increasing undergraduate enrollments. Recognition of the need to support many complex laboratory courses is needed at the college level if this program is to retain its outstanding reputation for undergraduate education.

It is **recommended** that the Department and College Administration determine a means to provide durable commitment to the Instructor faculty within the Department. These important faculty members deserve to have some reassurance of commitment to continued support by the Department. They are critical to the success of the Department in providing strong advising, teaching and mentoring of undergraduate students.

It is **recommended** the department begin efforts at directed fund-raising with the help of the OSU foundation. The University is starting a huge fund-raising campaign (to include bioinformatics) and the microbiology department can offer other ideas (new BL-3 lab, renovated labs, research positions). The interaction with the Foundation might also identify some opportunities for department-specific fund-raising efforts (scholarships, undergrad research funds).

Committee Process

On June 2, 2005, a Graduate Council/Curriculum Council team visited the Department of Microbiology to conduct a full program review of the Undergraduate and Graduate Program in Microbiology. Team members were:

- John Selker, Chair of the Graduate Review Team. OSU Bioengineering, Colleges of Agricultural Science and Engineering
- Lani Roberts, Graduate Team Member, Dept of Philosophy, College of Liberal Arts and Sciences
- Logen Logendran, Graduate Team Member, Dept of Industrial and Manufacturing Engineering, College of Engineering
- Mary Cluskey, Chair of the Undergraduate Review Team, Dept. of Nutrition and Food Management, College of Health and Human Sciences
- Rorie Solberg, Undergraduate Review Team, Dept. of Political Science, College of Liberal Arts and Science
- Eric Barklis, External Reviewer, Oregon Health Sciences University
- Jim Winton, External Reviewer, Western Fisheries Research Center

All members of the review team participated in a pre-review meeting held June 1, 2005, with the Dean of the Graduate School, Sally Francis. The Microbiology self-study report was provided to the review committee prior to that meeting. The site visit provided the review committee an opportunity to meet with Theo Dreher, Department Chair; Rich Holdren, Research Office; Sherm Bloomer, Dean, College of Science; Stella Coakley, Associate Dean, College of Agriculture, faculty; students; Department Graduate and Undergraduate Affairs committees. The team was given a tour of the facilities. All review committee members have participated in the preparation of this report and concur with its contents.

Summary and Findings

Undergraduate Program

The Department of Microbiology at Oregon State University has an undergraduate enrollment of 120-140 majors. The class is made up of approximately 50% female students and about 30% minorities, a higher percentage of minorities than other departments in the College of Science. The students are often transfers coming to the major as sophomores and juniors. The advising is provided by one of two Instructors who both have been involved in the Department for several years. Their advising and mentorship is both academic and professional, including directing students toward experiences in faculty laboratories in the department, on the OSU campus and in outside agencies and industries.

The Department carries a heavy load of service courses at the University, including Microbiology (MB) 230, an introductory lab course for non majors, MB 302/303, a

higher level introductory course taken by a bulk of non-majors as well as majors, and two popular baccalaureate core courses including MB 390, The World According to Microbes and MB 330, Disease and Society. The courses are frequently offered and well received. The World According to Microbes has received awards for the curriculum. The Department generates many student credit hours through undergraduate instruction and is efficient in utilizing their own undergraduate and graduate microbiology majors for teaching labs in the undergraduate science courses.

The Microbiology department has a strong undergraduate program. The curriculum follows guidelines from the American Society for Microbiology, although this is not an accrediting body. The curriculum includes a core, elective, and support courses for majors and then a laboratory skills component which currently are dependent on support from returned overhead and lab fees. The program attracts strong students and has grown modestly over the past few years.

The department is also ahead of its College in terms of learning outcomes and assessment. The Microbiology department has developed learning outcomes for all of its undergraduate courses as well as outcomes for the program itself. Assessment seems to be continual, particularly in the large service-based courses. An active student group participates in the collection of outcome data, providing students a very anonymous process to give input. Assessment takes place while students are in the major, in their classes, and after they leave the program.

Most undergraduates participate in laboratory research outside the classroom. These opportunities seem abundant and reasonably accessible to the interested student. The two main advisors do yeoman's work in notifying students of research opportunities on and off campus. When asked, the undergraduates did not know of any major that did not work in a lab on campus sometime during the completion of the degree. The committee finds this facet of the program commendable. The review committee finds the current funding model for key components of the undergraduate program, which relies heavily on returned overhead to support lab assistants, to be unsustainable and inappropriate. The College of Science should add-back the funding required to provide this educational program immediately.

Graduate Program

The graduate program in the Microbiology Department is also successful, but has some challenges. They enroll about 25 – 35 graduate students a year, with approximately 50% female enrollees and few minority students. The demographics however, show a significant preponderance of European American and Asian students with few or no Latino, African American and Native American graduate students. Though the department has made dedicated efforts, they have been unsuccessful in recruitment of many international students, and do not support as much ethnic diversity in their graduate program as they would like. The Graduate Affairs Committee actively participates in the recruitment of students from ethnic minorities, especially through programs fostered by the Graduate School, including the Western Name Exchange. Microbiology also takes advantage of the Minority Graduate Student Support Pipeline fellowships, which is

designed for Ph.D. students. They also recruit minority students at the annual conference of the Society for Advancement of Chicanos and Native Americans in Science and through the McNair Scholars Program.

The data indicate that the number of graduate student enrollment has decreased in recent years, with particular impact at the Ph.D. level. The faculty members attribute this to the ability to get well paying jobs with Masters degrees (job offers up to \$65,000/year recently) that makes doctoral level education not seem worth the investment. In addition, modest stipends (2004-05, approximately \$20,000) make competition for graduate students challenging. Loss of faculty and curriculum issues likely makes recruitment of graduate students even more difficult.

The incoming students over the last few years have shown a marked drop in their quantitative GRE scores. Although some of these problems may coincide with national trends (for instance, reduced numbers of highly motivated foreign students), some appear localized. One solution might be to make a greater effort to recruit graduate student applicants from traditional and non-traditional (physical sciences) undergraduate backgrounds.

The graduate students sense a new level of responsiveness to their needs, and appreciate the new graduate student lounge, complete with wireless internet access. At the same time they have commonly held and significant concerns regarding graduate advising and curriculum.

Concerns with graduate curriculum were identified by almost all of the graduate students interviewed, with dual effects of impairing close student contacts, and imparting a well-defined body of knowledge to the students. The committee was told that lack of a well-defined curriculum reflected the diversity of graduate interests that prevents a unified instructional content or approach. Despite this impediment, it appears to this committee that definition of a core curriculum required of all departmental grad students is feasible, has the support of the students, and will have a very positive unifying effect. The graduate students enthusiastically supported adoption of a required core course for all grad students that could include a historical review of the field, with an introduction to each faculty member and her/his research. There was also an enthusiastic response to the idea of including an ethics component (research ethics, bioethics) in the curriculum. If this core course could be developed for one or two credits, the graduate students believe they would develop a sense of community, which they do not perceive currently. While the students have their own ideas as to the optimal graduate curriculum, the faculty is in the best position to choose coursework that is most critical to the profession. Presumably this should include aspects of biochemistry, biophysics, and genetics. The department should strongly consider teaching some of this material in a joint program that includes graduate students of other biological sciences.

The Microbiology Graduate Affairs Committee notes that the requirements for the graduate students in slash courses are inconsistent with policy. The department offers a total of 14 slash (400/500-level) courses that can be taken by graduate students. Although a few additional course requirements (objective critique of an article, a presentation, etc.)

can be imposed on graduate students taking these slash courses, the learning graduate students receive may not be as effective as that received from taking strictly graduate courses.

It appears that the department perhaps has not taken full advantage of being housed in two colleges to help alleviate some of the issues concerning the graduate program. In the last three years, only one full-fledged strictly graduate (600-level) course has been taught in the department, with a couple of other 2 credit hour, 600-level courses are taught as special topics. The faculty in the microbiology department should work with faculty in other departments in the College of Science and the College of Agricultural Sciences to identify a set of common graduate-only courses (at the 500 and 600 levels) that will meet the requirements of two or more departments including microbiology. This would enable them to teach classes that are guaranteed to have a good enrollment. The shared faculty responsibility among departments might alleviate the teaching demand on microbiology faculty.

The expectations of graduates with an MS degree or, more fittingly, a PhD degree upon graduation are that: they should be able to write proposals, they should be able to manage a lab, and they should be able to speak in front of an audience. The experience they gain from holding a minimum of one-term, graduate teaching assistantship that consist largely of logistical support in teaching laboratory sections, is not adequate to meet these expectations.

The department assesses the quality of the research produced by PhD students by the number of journal papers either published or accepted for publication, prior to their final defense. Often papers are published with graduate student as the first author, and jointly with the student's major professor and others who have made a contribution to the research. In the past six and one-half years (1999- June 2005), a total 52 papers have been published, averaging 8 journal papers per year. The students and the faculty should be commended for this noteworthy accomplishment. While the number of journal publications produced by a PhD student is a rigorous yet objective measure to assess the quality of research, the consistency in using this measure across the different PhD committees is somewhat debatable. It appears that some committees have required as many as 5 to 6 journal papers, while others one or none. While it is hard to decide on a unique number of journal publications that would meet the rigor and expectations of the diverse areas of research in microbiology, it is strongly recommended that the department develop a consistent policy that can be used by all PhD committees. Inconsistent policies contribute to the student sense of inequitable treatment.

The committee was told by a broad group of students that the individual advising was quite good, but that the overall graduate advising was not meeting their needs or expectations. There was considerable confusion among the students as to the credit and distribution requirements to obtain a degree in microbiology, and a general dissatisfaction with access to timely, accurate, and accessible information related to the requirements and resources available relevant to their graduate programs. These issues require concerted attention to both understand their scope and remedy the causes.

Overall, the graduate program would benefit from more cohesion. The current program is somewhat disorganized, and in need of structural reform. The mechanism for tracking graduate student progress is not well defined. The graduate students speak of uncertainty in departmental and university degree and course requirements. The students perceive that there are funding inequities among graduate students. Although a graduate student is supposed to sit on the Graduate Affairs Committee, after the review and reading of the self-study, it appears that the position was vacant. Filling this position with a graduate student elected by peers may be an effective beginning.

Faculty

The faculty is currently made up of 12.6 tenured and 1.0 fixed term FTE positions, the majority of which are primarily research faculty, with only two dedicated to program instruction. This creates a potential for producing a wealth of opportunities for students who specialize with interest in a host of diverse specialties. In addition, although not a large faculty size, both the undergraduate and graduate programs are productive and successful.

The service teaching, in general, is met by the female faculty (2 instructors and 2 research faculty). Thus, the women in the department are teaching the larger courses and generating the largest student credit hours. The review team understands that in the past the instructors for the service courses included men. The team also understands that the department seeks to continue to improve the ethnic and gender balance of the faculty, which are worthwhile goals.

The decrease in faculty and graduate teaching assistant (GTA) lines combined with increasing university enrollments has burdened the laboratory courses as well as placed greater demands upon the instructional faculty. Without an increase in GTAs, the access to these courses will have to be restricted. The department has done well to adjust to the reduction in GTAs by providing an opportunity to undergraduates to serve as lab instructors. This is an interim solution. Replacement of at least two GTA lines would allow the department to continue its strong commitment to the providing for the educational mission of the university.

A few problems concerning faculty relations were uncovered during the site visit, echoed by students and some of the Administrators participating in the review. Graduate students noted a lack of collegiality between certain department faculty members. In a department as diverse as the Microbiology department is expected to be, a certain level of disharmony is to be anticipated. Nevertheless, things become destructive when faculty disagreements become apparent to students as we found here. Another faculty relation issue is the relative lack of women and minority faculty members: the department should make all practical efforts to recruit and hire women and minorities for diversification purposes. Finally, department relations have suffered as a consequence of having had four different department chairs in about five years. Hopefully the strong support for the current chair by the faculty and the administration will facilitate department rebuilding.

The Deans of the College of Science and Agriculture have already approved two new faculty searches for the Microbiology department. As the searches progress, the faculty should look to fill the open positions with the highest quality candidates—candidates who will have the greatest chance of attracting grant funding. In this way, the new hires will be a double boon to the department as they increase the number of research faculty and the number of graduate students that can be funded. We note that the research office, and the Colleges of Science and Agriculture seem ready to improve start-up packages to attract nationally competitive candidates and the department should push these offices to ensure such candidates join their ranks.

At one point, Dean Coakley suggested it would be desirable for the Deans of Science and Agriculture to reallocate the FTEs allocated for teaching and research to better reflect the current realities. This may be better done after a strategic planning effort, but could give a better (or more equitable) balance. Also, the faculty may wish to revisit the opportunities for additional research FTEs in new areas of agricultural microbiology (e.g. agricultural biotechnology, microbial remediation, agricultural bioterrorism) or other applied aspects relevant to the needs of the Oregon agricultural community that are not covered by existing faculty.

Currently, the Department has fairly established classical virologists on the faculty. While there is a need for the department to grow in areas of research that are perceived to be ‘cutting edge’ in microbiology for the 21st century, the efforts pursued by the Department seem to be directed in expanding the areas of research that are considered to be more traditional and are already in place at OSU. To gain national visibility, the Department should make every attempt to grow in areas of research that are considered new and somewhat revolutionary. Computational biology and bioinformatics are two new emerging research areas that have great potential of producing a wealth of opportunities for students who specialize in them.

Facilities

The Department of Microbiology is housed in Nash Hall on the Oregon State University campus in Corvallis. The building is four floors and contains the department office, lecture rooms, teaching and research laboratories, faculty offices as well as the faculty and graduate student lounges. Research equipment is perceived to be adequate, if not exceptional, with well-supported common facilities.

During the review, neither undergraduate nor graduate students expressed serious concerns about inadequacies of physical resources that interfered with their ability to be successful in their studies and research though opportunities to enhance the facilities were expressed by students and faculty. In several places in the self-study report, the Department has indicated a need for the renovation of Nash hall laboratory space. A tour of Nash hall showed walls with peeling paint, an aging infrastructure, and laboratory space that are decidedly not ergonomic, supporting this perspective. The department is making many investments to remedy these problems to the degree that resources can be devoted to these needs.

While it is understood that university funds are limited, resources should be invested with the specific goal of renovating laboratory space for incoming faculty as soon as possible. The ability to attract better faculty candidates is likely to recompense the university investment many-fold. A second research-related facility issue is the need for at least one readily available bio-safety level 3 (BSL3) facility. In the current national biomedical research funding environment, one of the best bets for achievable grant support is for research on emerging infectious diseases and bioterrorist threats. An optimal solution would be the construction of a BSL3 tissue culture/microbiology lab in Nash hall. A less satisfactory solution would be to ensure unfettered access to the Veterinary Medicine BSL3 facility. It would be best if access arrangements were adjudicated on a university-wide basis, rather than by the Veterinary College. Finally, it is remarkable how little shared equipment is available in the department. This may be due to the diverse nature of research in the department, and the number of chairs the department has had in recent years. Nevertheless, from the perspective of potential faculty candidates, the lack of a plan to procure and maintain departmental shared equipment must suggest a fragmented rather than cohesive unit.

Summary of Program Strengths and Limitations

Overall the Department of Microbiology Review resulted in the following strengths and areas to build and maintain:

1. Strong, productive and accountable academic programs
2. Satisfied students and alumni who support the Department
3. Successful program graduates at both the undergraduate and graduate level
4. Established faculty with solid funding and research track records
5. Campus recognition and collaborations around campus and within agencies and industry
6. Excellence in university service in providing non-major undergraduate teaching
7. Outstanding opportunities for undergraduate research and laboratory experiences
8. Diversity in gender at undergraduate and graduate level
9. Potential to replace two faculty positions

The following areas are of concern and are current limitations which should be addressed:

1. A lack of a strategic plan that looks to the future in terms of department direction given the economic, technological climate and the best fit with the College and University directions and missions.
2. There is need to stabilize the Department that has suffered through leadership changes, faculty loss and economic downturns. This should include strategies to support the new chair and unite faculty who may be factiously aligned undermining the cohesiveness of the Department as a whole. While the faculty was seemingly unaware of their fractious

nature, it has been perceived by graduate students and was communicated to the review team.

3. A need to examine the graduate program curriculum, structure and communication strategies with students
4. Fostering the minority diversification of faculty and graduate students
5. A need to manage growing undergraduate enrollments and decreases support for instructors/graduate teaching assistants and plan for future of the Instructors within the Department
6. A way to increase graduate student recruitment, particularly PhD students, perhaps by attracting cutting edge faculty and increasing stipends for students.
7. Aging facilities and laboratories that interfere with the ability to attract new faculty

Summary

The department of Microbiology has a committed faculty, enthusiastic students at all levels, and leadership that has vision and strong support. An important area of strength for the Department in the past has been the diversity of the areas of microbiology in which research and teaching are conducted. These include health-related areas (e.g. virology, immunology), agricultural topics (food, soil, dairy) and basic features of the microbial world (ecology, physiology, evolution and genetics). This breadth, relatively uncommon (especially for a small department), needs to be nurtured for the future as it provides an exceptional teaching environment and enhances opportunities for integrated and collaborative research. However, the last decade has been one of deep challenges and opportunities for the department. The transition from a culture of long-standing tight control to a period of staccato changes in departmental leadership has been difficult. At precisely the same time the department faced the most severe budget cutbacks in recent memory and significant growth in its student population. Finally, faculty members were lost to retirement and sister programs in the university that strained work-hours and collegial relationships. Despite these inopportune concurrent events, the faculty has maintained an outstanding undergraduate program, and a very strong graduate program. There is a palpable sense of joint commitment to the success of the program from the entire department community, and a belief that they are heading in the right direction. This summer the faculty plan a retreat in which they will lay out the direction to be taken on a number of key issues. The timing of this event fits well with the turn around in faculty numbers, the establishment of a new chair, and with the completion of this review process. The review committee is both pleased with the state of the department, and encouraged greatly by the prospects for the future. While there are clear areas that can benefit from greater attention, we are convinced that the department is engaged and committed to addressing our concerns and those that they perceive in a serious and effective manner. They will need financial and administrative support, most notably from the College of Science, to achieve the success they strive for, but these investments will be well placed given the setting the department provides.

Abbreviated Category I Proposal for Name Changes

Departmental:

BIOENGINEERING Changes to BIOLOGICAL AND ECOLOGICAL ENGINEERING

M.S. and Ph.D. Graduate Degrees:

BIORESOURCE ENGINEERING changes to BIOLOGICAL AND ECOLOGICAL ENGINEERING

Oregon State University

College of Agricultural Sciences

Department of Bioengineering

CIP* Number 14-0501

April 25, 2005

Effective Date: As Soon As Approved

- 1. Title of the proposed instructional, research, or public service unit. For name changes, give both the current and proposed names. Describe the reason(s) for the proposed change.**

The "Department of Bioengineering" will change to the "Department of Biological and Ecological Engineering", and the M.S. and Ph.D. in Bioresource Engineering will correspondingly change to "Biological and Ecological Engineering". Reasons for the proposed change are outlined below.

Overview:

"Biological and Ecological Engineering" more accurately represents the current and planned future foci of the department, and thus, is a more suitable department name. In 1999 the departmental name was changed from "Bioresource Engineering" (the name of our only current graduate degree program) to "Bioengineering" to match the undergraduate degree name. The undergraduate program was shortly thereafter removed from the department (against the majority opinion of the departmental faculty) by the provost, leaving the department with the name while the undergraduate program of the same name was housed in the current department of Chemical Engineering. This creates considerable and unnecessary confusion. Further, though adopted to represent the breadth of activities within the department, the name Bioengineering has evolved recently to focus increasingly on biomedical issues, which misrepresents the remaining faculty and graduate courses in the department entirely. Finally, working with the department's external advisory board, and following a survey of undergraduates, we have identified a new undergraduate program which should be established under the title of "Ecological Engineering." We have also identified the area of Ecological Engineering as an opportunity to promote the department to national leadership in research, and graduate education. This emphasis is consistent with the College of Agriculture's strategic plan and the OSU Plan for Distinction, and reflects the unique national strengths of OSU in natural sciences and engineering.

- a) Since renaming the department from “Bioresource Engineering” to “Bioengineering” several years ago, much has changed at OSU and on the national landscape. At OSU, an undergraduate program in “Bioengineering” has been developed. While it was initially developed and housed in the Bioengineering department, it is currently (and for the foreseeable future) housed in the Chemical Engineering department. Having a department and a separate academic program with a same name is at the least confusing and at worse damaging to the missions of both units. At a national level, only in the past few years has consensus emerged on the use of the term “Bioengineering” to reflect primarily biomedically-oriented engineering, and “Biological Engineering” to reflect a broader, more natural and human-managed systems perspective. We took a risk, with extensive and insightful advice, when we adopted the name Bioengineering on the hope that it would grow to encompass both realms, but this has not occurred. The current Bioengineering department is minimally engaged in biomedical engineering, and significantly (essentially exclusively) engaged in biological engineering associated with natural and human-managed system. At the national level, there has been a strong trend of former agricultural engineering programs to adopt names that include “Biological Engineering” (see Appendix 1), and our national professional society recently rename itself to the “American Society of Agricultural and Biological Engineering”. This trend has now become the national standard for programs like ours, and the alignment of OSU with national standards in this regard will improve recruiting of students, staff and faculty, reduce confusion associated with the current name, and provide consistency with the common usage of term Biological Engineering nationally and within the Land Grant system.
- b) The label “Bioengineering” has been counterproductive in recruiting students. We have seen a precipitous drop in graduate student applications since adopting the “Bioengineering” name several years ago. Our conversations with those students we have been able to discuss this with frequently points out the connotation of “Bioengineering” to refer to biomedical applications in applicants minds. The response to the terms “Biological and Ecological Engineering” has been very positive from our student’s perspectives.
- c) Based on a recent analysis of opportunity areas in undergraduate program development and corresponding polls of student interest, we anticipate the development of an “Ecological Engineering” undergraduate program in the near future. Incorporating “Ecological Engineering” into our department name and graduate program name will begin “branding” this term and facilitate recruitment into the undergraduate program when it is offered.
- d) Our students have graduate program needs in three areas – water resource engineering, ecological engineering, and biological engineering, with some overlap between these three areas. OSU’s recent Water Resource Engineering degree program serves the first need. Our current Bioresource Engineering degree encompasses both ecological and biological engineering; however, the “Bioresource” label has not served our students well and it’s inconsistency with the proposed department name will add confusion and will reduce our ability to attract students into the program. Thus we propose renaming the graduate

program to explicitly align with the departmental name and provide a clear opportunity to promote both the Biological and Ecological aspects of the program. No curriculum change is anticipated at this time. The College of Engineering is in the initial phases of planning a multidepartmental, college-level graduate program in “Biological Engineering”, of which we are strong supporters. If and when that program becomes available, we will simultaneously rename our graduate program to “Ecological Engineering”, providing the three needed degree pathways for our students: 1) Biological Engineering, through the college-level COE program, 2) Ecological Engineering, through our department, and 3) Water Resource Engineering, through the WRGP offered through the Graduate School. However, until that new program is approved and in place, we need a program label to serve the needs of our biological engineering students, and the use of “Biological and Ecological Engineering” as an intermediary solution is needed. We have discussed this with the College of Engineering and they are supportive of this pathway.

- e) We have had extensive discussions with our advisory board and stakeholders; the name change has been unanimously supported by our board and well-received by students and other stakeholders.
- f) The establishment of the cross-campus Water Resources Graduate Program in October of 2004 has provided a venue for many of the department’s faculty to attract students interested in Water Resources Engineering. An immediate increase in graduate applications has coincided with this change. This both illustrates the problematic nature of the current name, and provides a context for the renaming. Though Water Resource Engineering has long been a major thrust of the department, we committed almost 20 years ago as a department to the notion of providing a nexus for the application of engineering methods to natural systems.
- g) Nationally, departments such as ours that historically fell under the name of “Agricultural Engineering” at land grant universities have almost universally changed names to include “Biological Engineering.” Thus it has evolved that “Bioengineering” has been most closely associated with biomedical issues and the otherwise similar “Biological Engineering” with engineering of non-human natural systems. Thus renaming the department “Biological and Ecological Engineering” would be consistent with the national trend and would both better reflect the scope of departmental activities, and distinguish the two important and parallel academic thrusts that will be growing on campus in the coming decades.

2. Location within the institution's organizational structure. Include "before" and "after" organizational charts (show reporting lines all the way up to the Provost).

The department’s location within the current organizational chart will remain unchanged.

3. **Objectives, functions (e.g., instruction, research, public service), and activities of the proposed unit.**
 - a. **Explain how the program or unit's current objectives, functions, and/or activities will be changed. Where applicable, address issues such as course offerings, program requirements, admission requirements, student learning outcomes and experiences, and advising structure and availability. How will the reorganized program be stronger than the existing program?**
 - b. **Explain how outcomes in the newly organized program or unit will be assessed.**

The new name reflects the department's current objectives and activities. There is no current reorganization accompanying this change.

4. **Resources needed, if any: personnel, FTE academic, FTE classified, facilities and equipment.**

There are no additional resources associated specifically with this change. All existing faculty and support personnel within the department fully support this change.

5. **Funding sources: state sources (institutional funds - state general fund, tuition and fees, indirect cost recoveries), federal funds, other funds as specified.**

Funding sources will remain the same.

6. **Relationship of the proposed unit to the institutional mission.**
 - a. **How will the proposed program or unit support OSU's mission and goals?**

OSU has made its goals clear with the February 2004 publication of the campus strategic plan. Of the five strategic themes, two identify that OSU has a central leadership role in the management of Oregon's natural resources, consistent with the central mission of our department. Our current name does not reflect this core departmental mission. We believe that the new name will better reflect the coincidence of our mission with that of the university's.

- b. **Describe potential positive and negative impact of the proposed change on the program(s) or unit(s) involved. Identify other OSU programs or units which may be affected, and describe the potential positive and negative impact on their mission and activities.**

We see two very positive outcomes of this change. First, our department name will be consistent with its mission and recognizable to prospective students and clients of the department's research and extension products. Secondly, the new name will

greatly diminish the confusion that currently exists, both on and off campus, between our past undergraduate program and our current and future programs.

7. Long-range goals and plans for the unit (including a statement as to anticipated funding sources for any projected growth in funding needs).

The goals and plans of the department remain as stated in the strategic plan published for the department over 2 years ago. With greater coincidence between name and mission the department will improve in its ability to fulfill this set of goals. The department will continue to grow the Water Resources Graduate Program with its cross campus colleagues; will advance the engineering mission of the Sun Grant program; will advance biological engineering methods and applications for the enhancement of the Oregon economy.

8. Relationship of the proposed unit to programs at other institutions in the state.

a. What is the current relationship of the proposed program or unit to OUS and other higher education institutions in the state? Describe how this relationship might be altered based on the proposed change.

The proposed name change does not change the goals of the department or its relationship to the state, industry, nation, or world.

b. Describe how the proposed change will affect other constituencies outside of OUS.

This change will enhance the departmental effectiveness and allow clearer identification of our program to external stakeholders. This will enhance the ability of the department to serve the state in all the aspects of the activities carried out.

9. If the program is professionally accredited, identify the accrediting body and discuss how the proposed change may affect accreditation.

Programs falling under the department's domain are accredited by ABET, the Accreditation Board for Engineering and Technology. This board primarily accredits undergraduate programs, and we are currently a graduate-only program. However, we anticipate developing an undergraduate program in the near future. ABET accredits programs under several name identifiers, two of which are relevant here. The first is "Agricultural and Similarly Named Engineering Programs", which specifically list "Biological Engineering" as coming under this review category, and our professional society (American Society of Agricultural and Biological Engineers) is the lead society in this certification category. A second program area in ABET is for "Bioengineering and Biomedical Engineering Programs", for which the lead society is the Biomedical Engineering Society. This second category, although sharing our current departmental name, is clearly inappropriate for reviewing programs such as ours, and the name

change to focus primarily on “Biological Engineering” is consistent with ABET’s standards.

Appendices:

- **1. Summary of Names of Similar Programs**
- **2. History of Name Changes within the Bioengineering Department**
- **3. Transmittal Sheet**
- **Budget Table** N/A
- **Library Evaluation** N/A
- **4. Liaison** (attach all liaison correspondence, both internal to the college/school and with all affected, or potentially affected, academic units and institutions within or outside of OSU)

Appendix 1. Summary of Names of Similar Programs

Below is a summary of the major comparator or better institutions, mostly Land Grants, for similar programs across the US and the names of their programs: Land Grant Institutions are emphasized because OSU serves this role for the state and that historically Biological Engineering programs have been located within the Land Grant system. The first column lists the institution. The second column lists the current program name for those programs derived from and Agricultural Engineering department. The third column list any additional programs, typically derived from a Chemical Engineering focus, which may exist at the institution, and is included to emphasize the clear association of “Biological Engineering” with those programs derived from historically Agricultural Engineering programs within the Land Grant system.

Institution	Ag-derived department name	Non Ag-derived department name
Purdue	Agricultural and Biological Engineering	Biomedical Engineering; Chemical and Biomolecular Engineering
Cornell	Biological and Environmental Engineering	Biomedical Engineering
U. Florida	Agricultural and Biological Engineering	Biomedical Engineering
UC Davis	Biological and Agricultural Engineering	Biomedical Engineering
Michigan State	Biosystems and Agricultural Engineering	Biomedical Engineering
U. Arizona	Agricultural and Biosystems Engineering	n/a
U. Maryland	Biological Resources Engineering	n/a
Texas A&M	Biological and Agricultural Engineering	Biomedical Engineering
Washington State	Biological Systems Engineering	Chemical Engineering and Bioengineering
Utah State	Biological and Irrigation Engineering	n/a
Ohio State	Food, Agricultural and Biological Engineering	Chemical and Biomolecular Engineering
Clemson	Biosystems Engineering	Bioengineering (Biomedical focus)
Penn State	Agricultural and Biological Engineering	Bioengineering (Biomedical focus)
U. Illinois	Agricultural and Biological Engineering	Bioengineering (Biomedical focus)
U. Georgia	Biological and Agricultural Engineering	n/a
North Carolina State U.	Biological and Agricultural Engineering	Biomedical; Chemical and Biomolecular
Kansas State U.	Biological and Agricultural Engineering	n/a
U. Kentucky	Biosystems and Agricultural Engineering	n/a
Louisiana State U.	Biological and Agricultural Engineering	n/a
U. Arkansas	Biological and Agricultural Engineering	n/a
Virginia Tech	Biological Systems Engineering	n/a
U. Idaho	Biological and Agricultural Engineering	n/a
Iowa State U.	Agricultural and Biosystems Engineering	n/a
U. Missouri	Biological Engineering	n/a
Mississippi State U.	Agricultural and Biological Engineering	n/a
U. Nebraska	Biological Systems Engineering	n/a
North Dakota State U.	Agricultural and Biosystems Engineering	
U. Wisconsin	Biological Systems Engineering	Biomedical Engineering; Chemical and Biological Engineering
U. Maryland	Biological Resources Engineering	Bioengineering Program

Appendix 2. History of Name Changes within the Bioengineering Department

To provide some background and context for this request, we are including here a brief summary of the recent trajectory of the Bioengineering Department. The department and our profession have experienced considerable change over the last two decades, both internally and externally driven. The table below lists a chronology of events related to the changes associated with the Bioengineering department.

Action	Date	Reason
Established Agricultural Engineering Department	1910	Provide technical education supporting the agricultural sector
Department name changed to Bioresource Engineering	1991	Reflect broadening of the department mission into natural resources, environmental management, and water resources
Development of undergraduate program Biological Engineering	1996	Demonstrated need for undergraduate program in the broad area of biological engineering – name consistent with national trends
Department name changed to Bioengineering	2001	Reflected a decision by some faculty members that the “Bioresource Engineering” department name was not consistent with the undergraduate program direction; this was not a consensus decision and caused considerable debate within the department
Undergraduate Program name changed to Bioengineering	2001	Consistent with the department name change, the undergraduate program was renamed; reflecting a strong tendency within the students enrolled in the program towards biomedical engineering. This also reflected a naming convention supported by the Whittaker Foundation (a foundation funding programs in biomedical engineering, include OSU's program)
Bioengineering undergraduate program transferred to Chemical Engineering	2002	This change came about largely because of dissention by two faculty members about the commitment of the department to supporting the biomedical focus of many of the undergraduate students, and an assumption that the biomedical aspects of the program would be better served if the program was housed in the Chemical Engineering department
Rename department/program to Biological and Ecological Engineering	2005	Many reasons outlines in this proposal: Remove confusion on campus, align with nation naming conventions, provide consistency, identify emerging opportunity area (Ecological Engineering), others.

(OUS and OSU)

Category I Proposal Budget Outline

Estimated Costs and Sources of Funds for the Proposed Program

Total new resources required to handle the increased workload, if any. If no new resources are required, the budgetary impact should be reported as zero.

John: Thanks for making time to come over and visit with the FE faculty on the BRE321 and BRE Department name change proposals. I think this was a very helpful discussion. I am pleased to say that that FE Department will provide support for both of these proposals. I think we are slowly building some bridges between the two departments. Lets continue to look for opportunities to keep the conversations flowing.

Subject: RE: Department Name Change

Bill, I think the distinction has to do more with the "Engineering" side of things" We don't try to produce rangeland scientists, just as you don't try to produce engineers capable of being professionally licensed as such, if they so desire. We focus on quantitative analysis and design, in the engineering sense. An example would be a constructed wetland for wastewater treatment – we look at not only the biological processes that control this system, but also go through mathematical descriptions of the processes that describe governing equations, process rates, and kinetic parameters that model the rates of various reactions, and the mass, momentum and energy conservation equations that govern hydraulics of the system, all with the goal of being able to design a system that meets specific treatment requirements and could be permitted. Your comments would be equally relevant to the current "Bioengineering" or its many variants (Biological Engineering, Bioresource Engineering, Biosystem Engineering) that are used to designate programs like ours around the country"

I hope that helps. Let me know if you still have concerns.

Subject: Department Name Change

John

I read the Cat I proposal to change your Department's name. I looked up Ecological Engineering as defined by the International Ecological Engineering Society. It follows:

What is Ecological Engineering?

Definition according to the International Ecological Engineering Society.

Ecological Engineering has been defined as "the design of the human society with its natural environment for the benefit of both" (Mitsch & Jorgensen, 1989). Ecological engineering integrates various existing environmental fields such as classical ecology, agro-ecology, and restoration ecology. The skills of these fields are used to design low-impact systems for waste treatment, food and energy production, habitat restoration and other benefits.

Ideally, ecologically engineered systems should provide useful services for human society while at the same time retaining their function as an ecosystem. Ecological engineering also tries to introduce ideas which have grown out of ecology into engineering, such as "systems thinking", "whole systems design", "recycling strategies" and so on.

Ecologically engineered systems are not a priori sustainable but heading that way.

In many ways it defines Rangeland Resources, Fisheries and Wildlife, Forestry, etc.

Have you dealt with this idea and do you have a definition that is not inclusive of all the ecological disciplines on campus?

William C. Krueger, Head
Department of Rangeland Resources
Oregon State University, Corvallis, Oregon 97331 <http://www.orst.edu/dept/range/>

Subject: RE: Bioengr name change

Russ, thanks for your comment We've talked about the water issue, and concluded that we didn't want to include "Water" in our name since that has become pretty clearly a cross-departmental domain, with the new water-related grad programs, etc. I like the model that seems to be emerging of some cross-cutting themes being managed across multiple departments/institutes - sort of a fabric with departments running one way and themes running the other way. Our faculty associate with departments at one level, and with themes at another. That's how I see the water connection working.

- John

Subject: RE: Bioengr name change

John,

Sorry I missed your deadline. Had just one concern about whether this name reflects the extensive amount of water work that some of your faculty do. This is not readily intuited from the name.

Importance: High

DATE: February 16, 2005
FROM: John Bolte - Dept. Head - Bioengineering
SUBJECT: Curriculum Liaison

The attached Category I proposal describes the renaming of an academic unit.

In accordance with the liaison criteria in the Curricular Procedures Handbook, this memo serves as notification to your Department of our intent to make this curricular change.

Please review the attached materials and send your comments, concerns, or support to me by March 2, 2005. Your timely response is appreciated.

Please note - the attached budget for \$500.00 in expenses is to cover the name change for the Dept. Identity, Letterhead, and Business Cards.

Please note that a lack of response will be interpreted as support.

Thank you for your time and input.

Agreement between the College of Agricultural Sciences and the College of Engineering on
Names of Biological-Based Units and Degree Programs

September 2, 2005

The Bioengineering Department in the College of Agricultural Sciences:

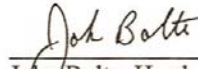

- The Bioengineering Department will be renamed "Biological and Ecological Engineering" with the full support of COE
- An undergraduate degree program in "Ecological Engineering" will be developed with the full support of COE

The Bioengineering program within the Department of Chemical Engineering, College of Engineering:

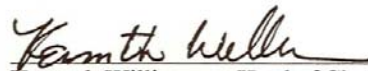

- The Chemical Engineering Department or School will be renamed to include "Chemical, Biological, and Environmental Engineering," with the full support of CAS
- Any specific unit housed in a future School or Department of Chemical, Biological and Environmental Engineering or similarly named school or department will not use the name "Biological Engineering"

COE and CAS agree to cooperate on the development of a joint, multi-departmental graduate program in "Biological Engineering".

Both COE and CAS agree to not use the term "Biological Engineering" as the name of any academic program, other than the multi-departmental graduate program described above.

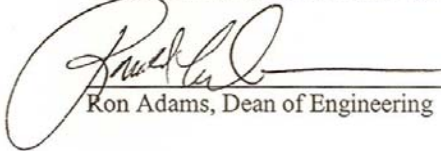

John Bolte, Head of Bioengineering

Kenneth Williamson, Head of Chemical Engineering

Thayne Dutson, Dean of Agricultural Sciences

Ron Adams, Dean of Engineering

GRADUATE COUNCIL MEETING

October 6, 2005

3:00pm, Memorial Union Conference Room

Present: Koenig (chair), Filtz, Francis, Gitelman, Gupta, Harter, McLain, McMullen, Proebsting, Rettig, Rockey, Strickroth, Tadepalli, and Unsworth

Absent: Pehrsson and Quinn

Guests: Chelsea Byrd, recipient of OSU Distinguished Dissertation Award and nominee for the Council of Graduate Schools/University Microfilms International Distinguished Dissertation Award in the Biological and Life Sciences; collaborators on Dr. Byrd's nomination and members of her dissertation committee: Dennis Hruby, major professor, Theo Dreher, Peter Bottomley; Robert Duncan, who nominated Leah Bandstra for the Frolander Outstanding Graduate Teaching Assistant Award.

1. Award Reception for Outstanding Graduate Student Teaching and Research

The Graduate Council hosted a reception for Leah Bandstra, recipient of the Herbert F. Frolander Outstanding Teaching Assistant Award and for Chelsea Byrd, recipient of Oregon State University's Distinguished Dissertation Award and nominee for the Council of Graduate Schools/University Microfilms International Distinguished Dissertation Award competition.

2. Introduction of new Council Members

Hal Koenig (Business) introduced himself as Chair of the Graduate Council and welcomed the Council members to the meeting. He invited all Council members to introduce themselves as many members are new to the Council this year. New members are Alix Gitelman (Science), Rod Harter (Health & Human Sciences), Tom McLain (Forestry), Starr McMullen (Liberal Arts), and Bill Proebsting (Agricultural Sciences). The graduate student member has not yet been selected.

3. Committee Assignments

The list of committee and subcommittee assignments for 2005-06 was distributed. For the benefit of those who had no prior experience with the workings of the various committees, Koenig briefly described the duties of the various committees.

Sally Francis (Graduate School) reminded the Council that these are "proposed" assignments. Council Members who would like to switch assignments were asked to inform the Graduate School at least a week from today's date. This is especially important in regard to members assigned to Graduate Program Review Panels. Francis informed the Council that she tried her best to distribute the work-load equitably, and she believes that she managed to achieve that.

Koenig announced that he is teaching from 4-6 this term and will need to leave each Fall Graduate Council meeting an hour early. Koenig asked to be informed if any Council member wanted someone else other than Francis to call the question when the graduate program review guidelines are discussed. Koenig admitted that he generally tries to avoid employing Roberts's meeting rules.

Koenig asked Bruce Rettig (Graduate School) about the timing of the Oct 20 meeting. Rettig answered that the agenda had not yet been set but that the Council would be informed of the meeting time soon. Rettig also warned the Council that the meeting on November 3 may be cancelled. The Industrial Engineering Graduate Program Review has been scheduled for November 3rd and that would mean that up to four Council members would not be able to attend a Graduate Council meeting on that day.

Koenig then requested that Dan Rockey (Veterinary Medicine) agree to help lead the second half of the Oct 20 meeting. Rockey agreed and Koenig left the room. Francis took over as chair.

4. Graduate Council Graduate Program Review Guidelines Revision

Francis informed the Council that the Graduate Program Review guidelines were last revised four years ago. Last spring the Graduate Council created a web survey to collect feedback from departments to learn how the Graduate Program Review process is perceived to be working. The Council had not previously discussed these tabulated results. Francis informed the Council that the survey revealed that, in general, everything seemed fine but that she decided to revise the guidelines in order to incorporate a few new procedures and to make the guidelines more user-friendly. For example, the guidelines were reorganized and separated into two sections: Information for Departments/Programs and Information for Reviewers.

One major improvement to the guidelines is the addition of an appendix of model tables. In the past, the Graduate Deans and the Program Review Panel members found that many self-study documents lacked some of the data needed for the review. The new model tables require that the same data be supplied as before, but the hope is that the new table format will prevent departments from forgetting to include information important to the reviewers.

Service Scores

On a side note, Francis informed the Council that Alix Gitelman (Science) reminded her earlier about the importance of including data on service courses in the Program Review self-study. Francis says that this represents a gap in the review process. Francis believes that the Council should soon discuss how best to review programs providing service courses. Francis used the Statistics Department as an example of a unit with service courses. Because that department teaches such a large number of service courses, there is a huge service toll on the faculty that goes beyond the work they perform towards their

graduate degree program. How should the Council review this? Francis would like to tackle this question with the Council's help this year.

Graduate Council Consent Agenda

Francis reported that the one substantive change made to the guidelines was an attempt to respond to the web survey question dealing with the perceived value of the panel chair's presentation of the review panel's report to the Graduate Council in the presence of the program's College Dean. Francis shared with the Council her surprise at learning that many units did not feel that the presentation of the review panel's report was a valuable undertaking. Francis proposed a revised guideline:

Consideration of the Review Panel Report The report will be distributed by the Graduate Dean to members of the Graduate Council for a 2-week review period. After two weeks, the report will be placed on the consent agenda of the Council for approval unless the Chair of the Review Panel, the majority of the Graduate Council, or the department chair/program director provides a rationale calling for full discussion of the report by the Graduate Council prior to its approval. In the absence of a request for Council discussion, the report will be considered to have been approved following the next regularly scheduled meeting of the Graduate Council. When a request for full discussion by the Council has been received, the chair of the Graduate Council will arrange for the report to be presented at a regular meeting of the Graduate Council where it is formally reviewed and accepted. The department chair or program director and academic college dean(s) will be invited to this Graduate Council meeting to comment on the content of the report. After the Graduate Council has accepted the report, either by consent or full consideration, the report is forwarded by the Graduate Dean to the Provost.

Francis described to the Council how she envisioned the consent agenda process to work.

Rettig commented that serving on a Graduate Council Program Review Committee is a rewarding experience. He asked Council members who served last year whether it also is valuable to have the presentation and discussion of the panel review report at a Graduate Council meeting.

Michael Unsworth (Oceanic & Atmospheric Sciences) told the Council that he still favors having departments come in for the panel chair's presentation. He said that although it might be true that department chairs and college deans don't find the experience valuable, he believes that the Council members do. He confessed that he usually hasn't read through the panel report in great detail before a meeting so it has been valuable to him to hear the panel chair summarize it in front of the Council. Michael felt that the discussion between the department and the Council was very useful as well. Placing the report on a Consent Agenda, though it seems like it would reduce workload, actually increases it. This would put the burden on all of the Council members to thoroughly review the panel report prior to the Graduate Council meeting.

Other Council members agreed with Unsworth. Tom McLain (Forestry) and Prasad Tadepalli (Engineering) commented that it is a positive experience for department heads and college deans to come together for the Council meeting. McLain stated that placing the review panel's report on a Consent Agenda sends the message that the review process is really not very important.

Sally called McLain's position to a vote – all agreed. Alternate language was brought forward:

Consideration of the Review Panel Report The chair of the Graduate Council will arrange for the report to be presented at a regular meeting of the Graduate Council where it is formally considered. The department chair or program director and academic college dean(s) will be invited to the Graduate Council meeting to comment on the report. The Council may accept the report as distributed, accept the report with revisions, or send the report back to the Review Panel for further work prior to final action. After the Graduate Council has accepted the report, the report is forwarded by the Graduate Dean to the Provost.

Francis explained that the paragraph above describes the procedure we currently follow.

Unsworth responded that although the old procedure is a lot of work, it sends the right message to the departments and colleges: Graduate Program Reviews are extremely important to the entire University.

Proebsting moved to reject the new (consent-agenda) procedure in favor of the old procedure. The motion was seconded and the vote unanimous.

Other changes to the guidelines were discussed by the Council.

Self-Study Cover Sheet

McLain expressed his concern over the instructions for the signing of the self-study cover sheet. He said that obtaining 35+ faculty signatures is too difficult an undertaking. Francis informed McLain that this idea resulted from the Zoology self-study. The reviewers of that Graduate Program commented that they were very pleased to see signatures indicating that everyone in the department participated/contributed to the preparation of the self-study.

Francis commented that the self-study and the review should be a group event. More than just one or two faculty members should be involved. Everyone should be given the opportunity to participate in or at least read the self-study.

Many members of the Council agreed that involvement is important, and when involvement impossible, that the self-study be made available to the entire unit prior to the review.

The Council debated who should sign the self-study cover sheet. All agreed that if only the department/program head signs, then s/he should include a statement indicating that all or appropriate graduate faculty members had an opportunity to participate in the development of the self-study or had an opportunity to review the final document. This led to discussion on how (and when) the self-study would be disseminated within the unit. Starr McMullen (Liberal Arts) was concerned that releasing the self-study two weeks prior to the site visit was not enough time for interested faculty to review and/or comment on the document.

Review Postponement

McLain directed the Council to page 3 of the new guidelines.

Postponement Programs may request a Postponement of a scheduled Intensive Program Review by presenting supporting evidence. In order to postpone an Intensive Program Review, programs must present data assessing program quality. Normally, Postponement may be granted for only one year and will require new data for each subsequent Postponement; but in rare cases, Postponement may be granted for a maximum of five years at a time if the program quality assessment data are sufficiently strong. Postponement may never exceed five years beyond the standard decennial review period. Postponement must be approved by the Graduate Council with the concurrence of the academic college dean(s) and the Dean of the Graduate School. Outcome assessment data (see Review Criteria, page 3) form the basis of requests for the granting of a five year Postponement of the Intensive Program Review.

McLain asked under what circumstances the Graduate Dean would agree to a five year postponement. Francis explained that to ask for a postponement a department chair/program director would have to collect all the data in the model tables and provide other supporting documents in order to demonstrate that its graduate program is of a sufficiently high quality to alter the review cycle.

Discussion regarding granting of and the length of postponements ensued. Francis admitted that a five-year postponement has never been granted.

After some discussion the Council agreed to modify the statement so that there is no mention of the possibility of a five-year postponement.

McLain made the motion which was seconded and approved unanimously, that the new language would be amended to:

Postponement Programs may request a Postponement of a scheduled Intensive Program Review by presenting supporting evidence. In order to postpone an Intensive Program Review, programs must present data assessing program quality. Normally, Postponement may be granted for only one year. Postponement must be approved by the Graduate Council with the concurrence of

the academic college dean(s) and the Dean of the Graduate School. Outcome assessment data (see Review Criteria, page 3) form the basis of requests for the granting of Postponements of the Intensive Program Review.

Comparative Data

McLain commented on the format of the model tables. He agreed that they present a good example to departments on how to present their data. He notes, however, that the tables only show departmental data, not normative data.

The Council discussed the importance of including national and peer institution data in the self-study for the sake of comparison and interpretation.

Rettig mentioned that OSU does not have a campus wide GRE requirement, so normative data across campus would have limited value.

Tadepalli commented that it makes more sense to compare your data with that of your peer programs.

Theresa Filtz (Pharmacy) told the Council that the advice of external reviewers can be important to gain perspective as well.

Other Guideline Concerns

Filtz asked if a statement regarding the different types of TOEFL scores could be added to the model table. Francis agreed that that would be a good idea.

Rockey asked if imposing a limit on self-study length could be considered. Francis responded that over-long self-studies are not normally an issue.

Filtz asked that strong language be included in the guidelines to remind self-study preparers to include narrative language to describe tabular data. Francis acknowledged the problem and agreed that that would be a good idea.

The Council agreed that they would be willing to work on revising the text of the guidelines electronically and later vote on the amended text electronically.

Francis called for other business.

Rettig informed the Council that Koenig (as Chair) sets the Graduate Council agenda. He urged the Council members, however, to feel that they too have ownership of the agenda. He encouraged the Council members to contact Koenig or himself if they would like additional items/issues to be added to the agenda.

Francis adjourned the meeting at 5:02 PM.

GRADUATE COUNCIL MEETING

June 2, 2005

3:00pm, MU Board Room

Present: Pehrsson (co-chair), Steel (co-chair), Bond, Ciuffetti, Filtz, Francis, Koenig, Pedersen, Rockey, Tadepalli, Unsworth, Waldschmidt

Absent: Brown, Rettig, Selker, Strickroth

Guests: Thayne Dutson, Dean – College of Agricultural Sciences; Russ Karow, Chair – Crop and Soil Science; Ron Adams, Dean – College of Engineering; Ken Williamson, Chair – Chemical Engineering; Jeff McCubbin– Exercise and Sport Science

I. Minutes of the May 19, 2005 Graduate Council Meeting

Dan Rockey (Veterinary Medicine) stated that he believed that the minutes inaccurately summarized Shing Ho's statements regarding the Biochemistry/Biophysics program review (page 3 of May 19th, 2005 minutes). It was decided that Bruce Rettig would work with Shing Ho to correct this paragraph within the minutes to make sure it reflects Ho's point.

Barbara Bond (Forestry) moved and Elaine Pedersen (Health and Human Sciences) seconded a motion to accept the minutes from the May 19th, 2005 Graduate Council meeting with the suggested change. The motion passed unanimously.

II. Other Business

Dale Pehrsson (Education) noted that Lynda Ciuffetti (Science) had another item of business to discuss with Council members. Ciuffetti noted that she has still not received responses from everyone regarding the end-of-year celebration for Graduate Council members. She said that Tuesday at 5:00 most likely will be the Graduate Council end of the year party; she will confirm this by e-mail.

Brent Steel (Liberal Arts) reminded council members of the rough draft version of the PhD report that he previously sent to council members for comment. He apologized for sending the wrong version of the document. He received additional comments from members which he appreciated. Steel noted that he had updated the document, adding in Bond's comments, and plans to send this to Council members again for comment. He thanked everyone for taking the time to comment and provide him with feedback. He will update the learning outcomes again and then send the document out for an e-mail vote.

Sally Francis (Graduate School) reminded council members that the web survey about Graduate Council Program Reviews has been completed. She noted that about fifty responses were received. She thanked all those who participated. She told Council members that she had prepared a summary which has been sent to Bruce Rettig and Mary Strickroth for comments. She

said that she would send the summary to Council members. She suggested that it could be discussed at the summer Graduate Council special meeting or it could be discussed in the fall when the Council reconvenes. Francis asked Council members their preference and noted that it may be helpful to discuss the results with the current Council members since they are more experienced in program reviews than would be the new council members.

Ciuffetti asked when the meeting is planned during the summer. Francis indicated that the Graduate School will work on identifying a time and date for the special meeting.

III. Community College Leadership Program Follow-up Review Report

Jeff McCubbin, Associate Dean of the College of Health and Human Sciences, presented the follow-up report of the Graduate Council Program Review of the Community College Leadership (CCLP) program. McCubbin gave a brief background of the report and stated that he met with the department to review the status of implementation of the recommendations. He stated that the committee believed that this was done in a superior manner. McCubbin said that the follow-up committee was very pleased with the progress that the department has made. He noted that there was some confusion as to which degree they were endorsing via this specific review process since there is degree authority for both an EdD degree and a PhD degree. McCubbin noted specifically that the EdD degree and not the PhD degree program had been reviewed. He said that the College of Education has made a clear distinction between the two but that sometimes they mistakenly get co-mingled together. McCubbin finished by stating that the review committee had no real concerns with the program. He said that he was available for Council members to ask him any questions they might have or to address any comments. Council had no questions or comments. Pehrsson thanked him for coming and Council thanked him for the hard work on this follow-up review.

Pehrsson called for a motion to accept the follow up report. A motion was made and seconded and the Council unanimously accepted the CCLP follow-up report, which is appended to these minutes as Appendix 1. Appendix 2 consists of material supplied by the CCLP program.

IV. Crop and Soil Science Graduate Program Review Report

Russ Karow, Erik Fritzell, and Thayne Dutson joined the meeting. Bond gave a summary of the Crop and Soil Science (CSS) Graduate Council Program Review report (which is attached to these minutes as Appendix 3), beginning with a summary of the review team's findings. Bond stated that this process has been very interesting to her. The committee found the process to have both highs and lows, which often left them scratching their heads. She began by stating that CSS is a very large program with many faculty members and students. There are about fifty graduate students in the program almost perfectly divided between the Crop Science Program and the Soil Science Program. Bond stated that students who go through the program normally are quite successful and get good jobs. She believes that students are generally happy with the program and are treated well. She also stated that there is fairly good grant support for the program. Bond stated that, although many of the departmental procedures were not clear to the committee, it was clear that they were working well for the department.

Bond stated that, although the review committee believed that this was a good program, the committee did have several suggestions. While the students are happy in this program, the review team felt there was not much of an integrated, department wide *program*. Rather, Crops and Soils operate quite differently, effectively offering two *individual* graduate programs. Principal investigators are currently setting the rules for admissions standards. Bond noted that this is not different from many other departments across campus.

The graduate student recruitment process was another area of concern for the review team. They did not believe that they received enough data from the department to understand how this process worked. However, the team noted that this process has been effective and it continues to work for the department. Bond stated that it would be helpful for the department to compile data about the number of prospective students applying to the program. Who exactly are they? What proportion of the applicants is accepted? These statistics are not currently being collected by the department. The department told the review team that it would be very time consuming to gather these data.

Bond stated that it would be beneficial for the department to create an “ideal student” that they would like to have in their program. Then, they should figure out how they could get this student to attend OSU. Bond stated that many students are “pre-admitted” into the program; as soon as there is an opening a student is informed to formally apply and is subsequently admitted. She stated that this is not a bad thing but that there should be a way to evaluate what is happening, particularly in regard to selectivity.

Bond said that the current graduate student population is very diverse and that CSS is doing an excellent job in this regard; it is a model for the campus. The review team believes that students are well supported. Statistics would have been helpful to analyze this issue, particularly the statistics surrounding scholarships and fellowships. Bond stated that it would be helpful to have scholarships available to students to support grants and fellowships.

The review team had several recommendations about curriculum. One of the strengths of the program was that it is highly interactive across campus. Bond noted that the department is weak in offering its own stand alone graduate courses but that they meet the fifty-percent rule by relying on other departments. The team believed that it would be good for the department to reallocate some of the resources from the undergraduate program and to improve the graduate program. Bond stated that better metrics would be helpful to evaluate how students were doing in the program and how long it is taking them to complete. She believed that graduate research assistants are all evaluated but that this is not the case for all other graduate students. The team felt that a department-level evaluation to track departmental success would be very useful.

Bond stated that the team was able to talk with only three students. She hypothesized that holding the student meeting on the other side of campus from students’ offices/classes may have contributed to the poor turnout. Therefore, Bond felt that the student input was not representative of the whole student population. But, the students the team spoke with did express some concerns. One concern was slash courses. Students felt that they do not get a good graduate level

experience within slash courses. Bond noted that this is not a new concern for students as many graduate students across campus feel this way. Nevertheless, students are graduating from the CSS graduate program and successfully finding jobs. However, offering a course, perhaps a one credit course, on professionalism would be a helpful addition.

The team determined that the department has great faculty. All faculty CV's were available to the review team. Bond noted that it would have been useful if the department would have summarized the CVs in regard to faculty productivity rate, grants and so forth. Bond noted that while this department has excellent faculty members, two good faculty members have been recently lost. This is not a problem specific to this department. Bond stated that the department should be careful so that more faculty members are not lost. Determining what the department can do to keep faculty members here would be good. She thought that thinking about how the department can address the needs of Oregonians could help the department gain a higher profile. Over the short term, it is clear that faculty salaries should be increased but the resources to do this are not currently available.

Another recommendation that Bond addressed was the development of a seminar course. One suggestion was to pair crop and soil students and give them a budget to develop this seminar.

Theresa Filtz (Pharmacy) added that the team had very little external perspective for this review. The department did not locate anyone from industry to participate in the review. The external reviewer with the CSREES team had industry experience, but did not have time to provide the committee with feedback. Filtz believed that this was disadvantageous to the program review since CSS has such an internally focused perspective. She also found it frustrating that only three students attended the meeting with the team. Filtz noted that when the team met with faculty members, it appeared that the faculty did not want to talk to the review committee. It was hard to get information from them. She concluded by stating that this program works extremely well if a student is associated with a good laboratory guided by a good mentor.

Bond believes that students leave this program with a crop and soil degree. The department needs to be more accountable for providing the necessary breadth to reflect this joint perspective.

Pehrsson thanked the committee for their report.

Bond added that she had one additional comment. This is a very large department and the team believes that the department head is doing a great job. She raised the question as to why these two departments, crop science and soil science, are together? Bond believes that they operate so separately that it is not obvious why they were ever combined.

Pehrsson introduced Dean Dutson who said that the merger of the two departments in 1990 was due to a number of factors. Measure 5 (property tax limitation approved by the citizens of Oregon) and the subsequent reductions in state supported budgets contributed to the downsizing of faculty numbers that occurred at that time. Dutson commented that there are many departments nationally that combine crop and soil science so this is not rare. Dutson believes that faculty feel ownership of both programs but that they like the disciplinary loyalty.

Karow commented that the degree that students earn is either a crop science degree or a soil science degree; a combined degree has not been established. The programs are in separate buildings, they are very disciplinary, and they both started from different places and have moved to different places. Karow said that they do have a fall seminar in which graduate students are required to give a seminar, to learn who the other graduate students are, and to learn about the diversity within the department. Karow commented that the seminar is not well attended. Many people do not come because they have stronger ties to another department. With limited time available, they choose to attend seminars in other departments or programs. Karow believes that it would be possible to plan a combined seminar in the future. He believes that these seminars are important to the department. They are also important to students because seminars give students an opportunity to work on presentation skills.

Karow generally agreed with Bond's comments. He believes that this department has excellent faculty members that work within the various concentrations. However, Karow stated that there are many collegial groups in this department and since it is such a large diverse department a student in one concentration may have no idea who you are if you are in different concentration. Karow then agreed with Bond's comment that if you are a student in one field, you may in a very good learning and working environment, but if you are in a different field, especially one with a smaller group of students and faculty, the support system may be less effective.

Karow believed that the concept of an ideal student was a helpful suggestion and was something that the department could do. He said that they have started this process by examining what a crop science student should know when he or she graduates. They then reason backwards to ensure the program gives the student what is needed to succeed in industry. Karow stated that the students' comments on a professionalism class were interesting. He acknowledged that this may be helpful to students; some of his students who graduate and then work in a university setting are unclear about the various processes that take place in that setting. Karow then commented that a one credit course on this topic could bring all of their graduate students together.

Dutson commented on faculty hiring. He believes that having faculty hired by other sources of employment is a problem that they currently face. He went on to describe the causes. First, salaries at OSU are low compared to comparable institutions. Dutson believes that the Provost and the Dean's Council were working on this but that there are many problems to be faced in addressing this issue. If OSU hires people at salaries needed to be competitive, salary disparity can occur relative to senior faculty. Another factor is the current salary freeze, which has limited the opportunity to make salary adjustments. While this is frustrating to many people across campus, Dutson believes that there is nothing that can really be done about this now. He went on to say that, since the beginning of 2001, they have lost eighty faculty members. Most of this was due to retirements but some faculty left for other jobs. Since the early part of 2001, only twenty people have been hired to offset the eighty people lost through retirement and resignations. Therefore, it has been very difficult to maintain diverse expertise. Dutson stated that the department would like to hire more faculty, but given the current situation it is difficult.

Commenting on the review process, Karow admitted that they would do this differently next time. When this graduate program review was being conducted they were also having a CSREES review conducted. He stated that the faculty has much more interest in dealing with the CSREES reviewers and devoted more time and energy into that review. Next time they will have these reviews conducted at different times. Filtz asked whether it would be more effective to have separate program reviews for the crop science program and the soil science program. Filtz thought that the next time these reviews took place, the Council should ask to have more separation between crops and soils. She believed that it is really difficult to bring these two programs together.

Karow believes that there needs to be a large umbrella overseeing the department and the different programs and bringing them together.

Bond made one more comment regarding this graduate program review. She asked the department to not take its graduate programs for granted. From talking with students, she concludes that this is a good program, but she believes some things could be changed. Bond suggested that they provide an opportunity for students talk to people they trust in a safe place where they feel like they can share information about how things are going and make suggestions for improvements. She thinks that this would be very valuable for the department.

Dutson asked Bond if she had any ideas why the faculty was so quiet when they met with them. Bond thought that it may have been the questions they were asking. The quietness of the faculty members made the team curious. Filtz felt like the faculty were annoyed by the review team and that this review was not something they wanted to deal with. Pehrsson wondered if the faculty did not appreciate the purpose of the review. She wondered if the goal of the review was not communicated well enough.

Pehrsson thanked everyone for their hard work with this review and asked if the Council had any questions.

Tadepalli said that most departments have core curriculum classes that graduate students take. He believes there are some disciplinary concepts that students should learn outside of their research focus. Karow said that in soil science there are a few core courses, such as statistics. However, many students come into the program already having taken this “core.” He thought it would be interesting to look at the transcripts of the prospective students to see what classes they have already taken and thus, what competencies they already possess before entering the program. Karow noted that crop science is much more complex. He believes that there are core classes each crop science student should take, such as plant physiology classes. But, few of these classes are offered any longer. He also noted that there are few classes that would provide a common core since crop science students have a fairly narrow research focus. Classes need to be selected with training targeted on a specific set of research topics. This is needed to make efficient use of students’ time.

Pehrsson again thanked the review team, Karow and Dutson for their work on this review. Dutson and Karow thanked the team for their hard work.

During Council deliberation of the report, Bond noted that she would have liked to have had more information at the time of the review. Filtz commented that she is interested in what the follow-up report might entail since she did believe that Karow offered many comments or feedback about the review. Ciuffetti asked the Council if it was not relaying enough of what is wanted and expected from the department in a program review self study. Bond felt that it was clear what the department was supposed to do, but they just did not do it. Steel felt that the department was not responsive. Bond acknowledged that the review team believed that they were not responsive because they have a good program and it is working well for them. Filtz reminded the Council of Karow's comment about the Graduate Program Review not being their highest priority at the time. Bond noted that the necessary material was not included in the self study document. The department told the review committee that it would be too time consuming and troublesome to gather all of the material requested.

Ciuffetti commented that Botany and Plant Pathology had a combined CSREES and Graduate Council Program Review together and took it very seriously. She wondered if the council should do something since Bond and Filtz felt so strongly about the outcome of this review. Bond suggested that the Council place the responsibility on the department to show the Council that they have a good program before the report is formally accepted. Pehrsson noted that the program review report had strong recommendations that need to be addressed. Tadepalli noted that they should be required to show that they have a good graduate program and that it is strong and rigorous. Bond believes that it is up to the department as to how seriously they want to take it a program review; she feels that they have a program where students are graduating but the department has decided not to take the program review seriously.

Steel and Pehrsson thought that the review team's recommendations were very clear. Pehrsson noted that if the graduate council accepts the report the follow-up report would be very important for tracking progress.

Ciuffetti reminded council members that the review committee did not feel they had the materials they needed to evaluate many aspects of the program. She believes that the Council cannot accept the report until they see the necessary materials. Pehrsson said that the Council could delay the process and that if they accept the report now the department will be required to provide this information at the time of the follow up report. Bond felt that the two-year follow up review would be sufficient.

Francis questioned how the Graduate Council would back up a decision to not accept this report. She asked whether the Council whether admission in the program should be suspended.

Rockey reminded the council that what the department is doing now, although unclear to the review team, apparently is working. He suggested that the council should let them continue as they are doing, as long as what they are doing is working. Pehrsson would like evidence of how well it is working. Bond would like the department to take accountability by showing what the product of their program is and how they assure quality.

Pehrsson asked Council members if they would like to accept the final report but to include an expectation for the department laying out exactly what needs to be done. Council members agree to accept this report with the stipulations that Pehrsson laid out; the motion was accepted unanimously.

V. Chemical Engineering Graduate Program Review Report

Ciuffetti introduced the Chemical Engineering Graduate Program Review Report, which is attached as Appendix 4. She said that the review team had good interactions with the external reviewers and that their insights were very helpful. Bob Powell was excellent and heavily relied upon by the committee. Ken Williamson, head of Chemical Engineering, provided a self study that included all the necessary information.

Ciuffetti noted that Chemical Engineering has had a re-birth with a much higher focus on research. They doubled their program in 2000 and added new and diverse faculty. In the late 1990's the department faced administrative problems. Thanks to Williamson the department has changed; faculty members really see Williamson as a very positive person. The department believes that adding bioengineering will make their situation even better. Specific recommendations are outlined in the final report.

The review team found that the faculty members have graduate degrees from the top chemical engineering departments in the country. These faculty members also embrace people from other departments, such as chemistry, which allows for a broader resource base for students. It was noted that there is a potential merger with environmental engineering. The review team did not know how the outside reviewers and faculty members would react to this but they were pleasantly surprised at what they found. However, some problems were also discovered. One problem was the delayed promotions of several associate professors to full professor. Ciuffetti stated that the team believed that the department should look at this. If this is true and if it was caused by poor leadership, it should be corrected.

The number of PhD students in this department is very small although the department intends to increase it. The team would prefer to see a higher enrollment target than what the department has set. In general, graduate students felt that they had very strong social bonds between each other even though they are few in number. They noted a few things that they were not pleased with. One was the organizing and formatting of their preliminary exams. Greg Rorrer provided leadership in restructuring preliminary exams; Ciuffetti believes that Greg has made a difference in this process and that students are now happy with the revised process.

Ciuffetti said that they found that GRA and GTA stipends are very competitive, but the fees that this department requires the students to pay dilute the competitiveness.

The program review team did not feel that the facilities were adequate in this department. They did not feel that there was adequate desk space or lab space and that materials need to be looked at.

Ciuffetti made it clear that the committee felt that exceptional leadership is needed for the continued growth and development of this program. Williamson is providing excellent leadership for this department but it is clear that he will want to retire at some point. The committee believes that a discussion needs to take place with the dean, chair and faculty to determine how they will handle things upon Williamson's retirement.

Not all areas of specialization are located together; the department should look at this, especially with the potential mergers. The proposed mergers will be beneficial, but the different programs will have very different cultures; this needs to be looked at more closely.

Ciuffetti said that the department should stress external funding of faculty and that the team believes this is the key to development for the department. They should develop recognition for international funding.

Ciuffetti asked if Rockey had any comments that he would like to add to her report. Rockey added that this is a good department. He believed that facilities were a large problem. He also noted that the square footage per faculty member is already limited; if you increase the number of faculty in the given space, this will be more of an issue. He reinforced Ciuffetti's statement that continuity and leadership in this program will be difficult when Williamson retires.

Dean Ron Adams noted that this graduate program is in transition as a discipline. Previously it was largely centered on the pulp, paper and oil production industries; those industries have declined a great deal. The department's focus is now more on the electronics and the micro technologies industries. Adams then noted that he took over as dean only three years after the bioengineering department came into the College of Engineering and that it has been hard to hold things together and determine where that department will go from here.

Williamson said that they saw the opportunity to pull these departments together and bring about a positive change. He believes that the aftermath of the bioengineering move has taken some time. In 1995 there were six faculty members in chemical engineering and in 2006 they are planning to have about 17. This department would really like to be a high technology research facility do high level PhD research. Williamson noted that they are not very interested in turning out undergraduates. He suggested that the faculty members question some things periodically but that the department does know where they are headed. They have the vision and have been trying to get there. They will be the only department in the United States to have all three of these areas combined. Williamson suggested that they are also trying to increase research funding. In 2000 it was \$220,000 and this year they are garnering about \$1.5 million. They are estimating this to be about \$2.5 million next year. When they bring in the department of environmental engineering, research will increase to about \$5 million. Williamson noted that the facilities in Gleeson hall were made for chemical engineering students and that it is largely out of date. They department does have plans to remodel but they do not yet have the funding. He believes that the alumni do have the capacity and wealth to put this together and that there are just some logistics standing in the way.

Pehrsson asked how they plan to transition when he decides to retire. Williamson believes that

when these three departments merge, his position will be a dream job for someone especially since it will now have a biological area.

Williamson commented on graduate student support. He said that there were no GTA's when he arrived and that he has raised the GTA stipend 10 percent a year since he has arrived. He said that he needs to do this two more times to be competitive. He noted that he has been cautious about going too fast in fear of creating disparity. He believes that the department competes very well and has a great international reputation.

Adams responded to the council's question on leadership. He said that he would like Williamson to stick around as long as possible and that he believes that Williamson is doing an excellent job. He also has faith that Williamson will build something that will be very attractive before he decides to retire. Adams noted that there have been many leadership transitions over the past 5-10 years so he would like to keep Williamson as long as possible. Adams agrees that this department has had many struggles in the past but, thanks to Williamson, they have made a lot of progress and things have been going better. There are a lot of great faculty members here that work hard for this department. They work with a group of very talented people and Williamson has been able to unleash this talent among faculty members.

Pehrsson asked the Council for questions.

Tadepalli said that he believes that these three areas merging into one is a good idea. He asked if the department is planning on having one graduate program combining all of these areas. Williamson said that the department is planning on maintaining separate degrees for each of these programs but they would like to possibly have an interdisciplinary program as well.

Rockey stated that there would be a follow up review in 2 years. He believes that it would be great to lay out the leadership problems and the transition process in the follow-up. He thinks that it would be beneficial to see the transition plan and a succession plan for when Williamson retires. Faculty may want to have a role in deciding how to carry out this process. However, Ciuffetti noted that if Williamson is planning on sticking around for awhile, this conversation may be premature. She noted that the committee found this such a critical component because of concerns they heard throughout the day about this and also past issues. This process will be very critical for this department to be continually successful.

Ciuffetti noted that students were also concerned with professors teaching out of their expertise. Students thought that some of the courses were not being taught with the expertise that was needed. This was apparent when they had a chemical engineering course being taught by someone not in this field. This concern is included in the committee's recommendations. Williamson said that this is a unique situation and he believes it was blown out of proportion. He also noted that students and faculty are very sensitive to this issue. Ciuffetti acknowledged that this could have been the case.

Williamson stated that having three departments come together like this and work together under the chemical engineering culture is a very difficult task that takes a lot of work. He thinks that

when this is all done that it will be unique and competitive. Williamson commented on Ciuffetti's statement about promotion issue and said that this year his department put two people up for promotion and both were promoted.

With no further questions from the Council, Pehrsson thanked the team for their hard work. Adams and Williamson also thanked the committee. Tadeballi moved to accept the report and Filtz seconded it. The motion was accepted.

VI. Statistics Graduate Program Review Report (continued)

Koenig prepared a handout in response to the prior request for more specificity in the review team's recommendations. Koenig that the recommendations in the section entitled "Summary of Findings and Recommendations" be replaced with the following:

Recommendations:

- The College needs to fund two additional faculty lines (2.0 FTE) in support of delivery of statistics courses and consulting.
- Additional funding from the College of Science must be provided to increase graduate stipends at least 20%.
- Funding for minority scholarships should be found and used for recruiting.
- The Department must decrease the amount of unpaid consulting and the number of graduate committees they serve on.
- Growing the Survey Research Center should be a priority too, especially if it can be accomplished by bringing another faculty member who can share the teaching load while also managing surveys. The presumption is that most of the financial support for this position would come from "soft" money.
- An aggressive program of specialized courses is needed; we recommend offering at least one additional, special topics course per year. This would produce a large benefit for the department as both students and faculty would be exposed to new and emerging topics in statistics.
- Providing adequate computer support for graduate students is imperative.

He stated that the funding would have to come from the College of Science since the department does not have the funds available internally. Ciuffetti stated that it would be hard for the Dean of COS to give this to only one unit and not to others.

With no further comments Pehrsson asked if there was a motion to accept the Statistics report. The Graduate Council voted and the motion to accept the report as revised passed unanimously.

Review team members: Jeff McCubbin, ExSS, HHS; Vince Remcho, Chemistry, CoS
Program representatives: Sam Stern, Dean, School of Ed.; Rich Shintaku, Director, CCLP

The review team and representatives for the CCLP program met on 17 March 2005 for the purpose of discussing the response of the CCLP program leadership to the full review, conducted on 7 June 2002 and reported to the Graduate Council on 28 October 2002. Present were Jeff McCubbin and Vince Remcho (members of the 2002 review team) and Sam Stern and Rich Shintaku. In advance of the meeting, Shintaku prepared a follow-up review summary document (attached) that details the response to the specific recommendations of the 2002 review panel.

The review team sought specific responses to the following questions:

1. How has the program changed and grown since the full review in October 2002?
While the absolute number of students has remained essentially the same at ~14 per cohort, there has been a reported improvement in program quality and preparedness of entering students for graduate study. No data were presented on program quality, but anecdotal information and critical information about % of minority applicants and geographical representation were shared with the reviewers. The CCLP program is one of very few programs of its type nationally, and as it has become more widely publicized the number of applicants has grown. According to Stern and Shintaku, this has resulted in the institution of a more selective admissions process and a concomitant increase in student capability. Acting on recommendations from the review panel, the program has become more academically rigorous, as addressed below.
2. How has the faculty contingent with direct responsibility for the program changed in the past 2 years?
There have been significant changes in the faculty in the School of Education due primarily to retirements. The CCLP program has been affected by these changes, though the impact has largely been positive in part owing to the hire of a faculty member whose efforts are having a direct impact on program quality. Several faculty remain involved in the program following retirement. Faculty participation in the CCLP program is as follows:
Alex Sanchez (~0.7 FTE)
George Copa (~0.5 FTE)
Rich Shintaku, director (~0.25 FTE)
Darlene Russ-Eft, hired since the 2002 review (~0.5 FTE)
Betty Duvall, Director of the CCLP program in 2002, has retired yet is still teaching two classes and supervising students. There are several fixed-term, part time instructors who assist in offering coursework that is key to the program. Roughly 60% of the coursework component of the degree is taught by regular faculty.
3. The program web site lists a Ph.D. program in community college leadership. This degree program was not reviewed in 2002 and did not appear to be offered at that time. Are students pursuing this degree?
Stern has conversed with representatives in the Graduate School regarding degree offerings in the School of Education. The School currently offers two doctoral degrees: an Ed.D. in Education and a Ph.D. in Education. The degrees are not program specific according to Stern, such that students may pursue either degree and focus their studies in a way that allows them to address their particular professional interests. The degree requirements for the Ph.D. are different than those for the Ed.D.

Apparently some of the current cohort of students are in the Ph.D. program, while others are in the Ed.D program. It is too soon to determine if this will be problematic (creating confusion in applications etc.).

4. How have the commendations of review team been met (i.e., how are you building to existing strengths)?
 - a. Preparing needed community college leaders and administrators.
The program remains popular with professionals working in the administrative ranks of community colleges in the region, and is well respected regionally and nationally.
 - b. Format that is conducive to part-time students.
The off-site, weekend format of the program continues to be popular and successful. Efforts have been made to enhance connectivity to the Corvallis campus and to enhance the technology elements of the Silver Falls “classrooms”. School of Education did seek internal computer resource fees to enhance the capability of the connectivity for the program, but it has not yet been funded.
 - c. Faculty involvement and personal commitment to the program.
A new hire whose area of research is directly aligned with one of the major areas of concern in the 2002 review has enhanced the quality of the program. Faculty support for the program remains strong, though time committed directly to the program by the various faculty remains small. A planned hire during Spring 05 will add to the faculty in this program. There remains a recognized need for faculty in the program whose area of research is CCLP related research.
 - d. Capitalizing on the Silver Falls environment.
Students and faculty continue to interact in formal and informal discussions at the Silver Falls site. The relaxed environment is universally appreciated, though access to teaching resources is quite limited and likely cannot be addressed at this site.
 - e. Improving retention and completion statistics.
The format of the program is ideal for those who are pursuing a graduate degree while working full time. This has allowed the program to maintain a high rate of retention and degree completion.
 - f. Positive reputation of the program.
.....
5. How have the recommendations of the review team been addressed?
 - a. Establishment of an external, impartial advisory board.
This has been accomplished. An external advisory board has been assembled for the School of Education, though it is not program specific. The membership of the board is enumerated in the attached documentation. Additionally, a Development Board has been appointed.
 - b. Strengthen assessments of the coursework component of the curriculum.
The portfolio guidelines have been extensively revised and strengthened (and are attached). The goal is to have the portfolio be less a “personal reflection” and more a “synthesis of learning” document.

- c. Expand the program to serve a larger and more widely distributed population.
A new and similar program starting at UC Davis has increased the level of competition for attracting qualified students, though the reputation and history of the OSU program has allowed it to continue to be the most recognized of its kind regionally. Students travel from Utah, Arizona, Washington, California and Hawaii to participate in the program at Silver Falls. 30% of the students are students of color, and most are non-traditional students returning to school after a long absence. According to the program director, all students in the program are working professionals, many of which assume academic and administrative leadership roles in community colleges and other higher education settings.
- d. Enhance and improve the coursework requirements by adding statistics to the curriculum, etc.
The hire of Darlene Russ-Eft has been the major factor allowing the program to respond to this recommendation of the 2002 review team. Russ-Eft's expertise is in academic assessment, and her experience with experimental design and quantitative analysis have factored largely in shaping the new coursework requirements of the program. The specifics of the new courses are outlined in the attached self-study documents.
- e. Change the structure of student committees to foster peer review of the program and its outcomes.
New guidelines for committee composition have been implemented and are detailed in the attached material.

Recommendations of the review team:

1. The reviewers commend Shintaku/Stern for critically evaluating the previous full review and working to address areas of need as identified by the review team. We recommend that efforts to extend and enhance the academic rigor of the program be continued.
2. We further recommend that the director solidify the roles of the various faculty who are involved in the program and make their commitments to the program more public.
3. We recommend a review of the degree offerings of the School of Education, in particular those degree offerings that relate to the CCLP program, with clarification on what degree programs are available and in what areas of specialization. This review should involve the Dean of the Graduate School, the Dean of the School of Education, and the directors of the various programs within the School of Education that offer graduate degrees.

Appendix 2

Appendix 2

Community College Leadership Program Follow-up Review:

Unit Summary of Reaction/Response to Report of Review Team and Specific Actions Taken to Address Recommendations

March 2005

With the constant demand for quality and effective leadership in a variety of educational and workplace settings, the Graduate Council program review of the community college leadership program could not have come at a more opportune time. In 2002-03, the program faculty and staff welcomed the opportunity to conduct a self-study and participate in an open and thorough review of the program. The recommendations set forth from the review team clearly reinforced the desire to be recognized as one of the premier and nationally-recognized graduate programs in higher education leadership with a specific emphasis in community college leadership. Utilizing the report's summary of recommendations, the following provides a brief update of the original response/reaction and implementation plan.

1. Set up an advisory council with members of faculty, community college administrators, and outside evaluators involved in research on community colleges (such as a professor from another university), to evaluate the program content to assure that the rigor and content meet the standards set in the field.

Since our initial graduate program review, both an advisory board and development council have been established in the School of Education (attached) for the purposes of supporting the mission, vision and values of the School along with providing ongoing program feedback, development and support. Among those on the advisory council include Dr. Mary Spilde, President of Lane Community College; Dick Swanson, Professor of Human Resource Development and Adult Education at the University of Minnesota; Dr. Mildred Ollee, President of Seattle Central Community College; and Dr. Hiromitsu Muta, Professor and Director of the Center for Research and Development of Educational Technology at Tokyo Institute of Technology.

In addition, we have also updated our membership in Council for the Study of Community Colleges (CSCC) and are now actively involved in the Council's activities. An affiliate of the American Association for Community Colleges (AACC), the purpose of the Council is to conduct and disseminate research pertaining to community colleges; serve as a forum for dialogue between university professors, graduate students, and community college practitioners who study community colleges; and to contribute to the development of pre-service and in-service education for community college professionals. Council members include university-based researchers and community college practitioners who further scholarship on the community college enterprise.

2. Strengthen the assessment of the coursework portion by providing specific guidelines for the portfolio, the option of a formal written examination, or some combination thereof, or consider alternatives to the reflective portfolio/essay for the prelim exam. This assessment should be directly related to the course content and should be something that addresses doubts regarding the rigor of the program.

As the result of program development, thoughtful consideration and coordination, the doctoral program portfolio guidelines have been strengthened with particular attention given to the evidence of accomplishing program outcomes (attached). In addition, a more rigorous and intentional process has been developed including the option of a formal oral and written examination.

3. As resources become available, expand the program in order to serve more doctoral students throughout the Western States.

Specific to resource development, the department is currently in the process of adding two new tenure track faculty lines, one of which will have primary responsibility for the CCL program. In addition, interest in the doctoral program has increased tremendously in the last three years demonstrated by more diverse student candidates as well as program selectivity. Current demographics include students of color (approximately 30%), sexual orientation diversity, gender balance, as well as geographic diversity. Current students are commuting monthly from Utah, southern and northern California, Hawaii, eastern and western Washington, and Oregon. As a result of an overwhelming increase in prospective students from California, we held our first admissions outreach event in northern California (Sacramento) hosted, in part, by one of our current students and Cosumnes River Community College president, Francisco Rodriguez. Diversity remains a priority for the program as we strongly embrace the relationship between academic excellence and diversity.

4. Ensure that students obtain sufficient education in quantitative analysis of data and in experiment design. Add at least one true statistics course to the program preferably one that also introduces students to a statistical program they can use. This seems to be fairly standard in other such programs and is a notable omission here.

With the addition of program faculty who possess specific knowledge and experience in quantitative analyses and experimental design, we have added both rigor and clarity to our statistical analysis requirement as well as a recently approved checklist for meeting this requirement (attached). Beginning this year, we have added two new course offerings to our research series, Quantitative Analysis in Educational Research I: Introduction and Descriptive Statistics and Quantitative Analysis in Educational Research II: Introduction to Inferential Statistics.

5. Require only one community college (adjunct) member on Ed.D. committees and permit faculty from other departments at OSU (such as statistics, philosophy, political science, etc.) to participate. This will foster critical, regular, periodic peer review of the program and its outcomes.

Since our graduate program review, we have established new guidelines for the selection of adjunct faculty for graduate program committees (attached). Included in the new guidelines is a change in the requirements for committee composition as well as including specific guidelines for selecting adjunct faculty members.

- Guidelines for Selection of Adjunct Faculty for Graduate Program Committee

March 2005

*Community College Leadership Program
Oregon State University
School of Education*

Doctoral Program Portfolio Guidelines

Purpose

1. Serve as alternative to preliminary written examination
2. Written documentation of student's understanding of major field (mastery of outcomes for community college leadership program)
3. Written documentation of capability for research

Suggested Assessment Guide

1. Title Page – The student has provided a title page for the portfolio that identifies the candidate.
2. Membership of Preliminary Examination Committee – The student has provided list of names and positions of those serving on her/his preliminary examination committee to include: (1) for the Ed.D: the major professor, School of Education representative, Graduate School representative, and courtesy faculty (2), and (2) for the Ph.D. the major professor, School of Education representative, Graduate School representative, another OSU faculty member, and courtesy faculty (1).
3. Professional Introduction – The student has provided a brief introduction to her/his professional interests and plans. The professional introduction is limited to 1 page.
 - Professional Interests – A brief description is provided.
 - Professional Plans – A brief description is provided.
 - Evidence of Accomplishing Program Outcomes – The student has provided adequate evidence that each program outcome has been accomplished. The evidence for each learning outcome includes: (1) synthesis of the learning in the program that informs the student's educational practice with regard to the learning outcome (to include theoretical underpinnings, promising practices, current issues, and future directions); (2) reflection on the learning in relation to the learning outcome (to include integrating learning with one's professional philosophy and practice and raising significant issues for further thinking, learning, research, and practice); and (3) a specific plan for continued learning in areas of most need regarding the outcome. The presentation of evidence is limited to 30 pages in total. Exhibits of selected evidence are provided in the appendix to the portfolio (give emphasis to accomplishments during doctoral program)
Education includes the following:
 - Courses,
 - Academic work (e.g., papers; presentations; project reports; internship reports),
 - Assessments by instructors, mentors, supervisors, peers
4. Appendices – The student has provided the following background information:
 - References, using APA format
 - Current Resume
 - Program of Master's Study – list of course titles, course descriptions, credits, and grades
 - Program of Doctoral Study – list of course titles, course descriptions, credits, and grades
 - Selected exhibits from the educational program (not to exceed 30 pages)

Process for Review

The portfolio will be reviewed by the members of the student's Graduate Program Committee who are from the major (i.e., Community College Leadership) prior to the Preliminary Oral Examination. The review will be administered by the student's major professor. The portfolio will continue to be revised until it meets the approval of the review group of faculty. Final results of the review will be reported by the student's major professor to the Graduate Program Committee at the Preliminary Oral Examination meeting.

Community College Leadership Program

Checklist for Meeting Statistics Requirement

Area of Competence	Know	Able to Do
Vocabulary of statistical analysis	Measurement scales (i.e., nominal, ordinal, interval, ratio) Hypotheses (i.e., null and alternative) Statistical significance Types of statistical error (i.e., Type I, Type II) Power analysis Population/sample Beta weights Coefficient of determination Correlation (i.e., positive, negative) Correlation matrix Covariates Types of variables (i.e., dependent, independent, predictor, intervening, moderator) Critical region in distribution Frequency distribution Linear and curvilinear distribution Interaction effect Effect size Types of statistical tests (i.e., parametric, non-parametric) Types of statistics (i.e., descriptive, inferential) Reliability tests (i.e., Kuder-Richardson split half, Spearman-Brown, test-retest, Cronbach alpha) Types of effects (i.e., main, secondary) Measurement Probability sampling P-values Randomness Regression Regression line Regression tables Reliability Sample Sample size formulas Sampling error Scatterplot Statistics Unit of analysis	Able to comprehend and critically review reports of research that use statistical analysis

Vocabulary of statistical analysis	Variable Variance Types of sampling distribution (i.e., normal, non-normal) Skewness and kurtosis One and two-tailed tests Chi-square analysis T-tests and other paired comparisons Analysis of variance Factor analysis Regression analysis Structural equation modeling (SEM) Discriminate function analysis Meta-analysis (purpose and procedures)	Able to comprehend and critically review reports of research that use statistical analysis
Descriptive statistics	Frequency distribution Table and graphic presentation Measures of central tendency (i.e., mean, median, mode) Measures of variability (i.e., standard deviation, variance, interquartile range, range) Measures of relative standing (i.e., standard score, z-score, percentile) Measures of relationship (i.e., correlation)	Comprehend and critically review research reports that use descriptive statistics Given a data set, appropriately select and calculate descriptive statistics Interpret and design appropriate reporting formats for descriptive statistics Use Excel spreadsheet and statistical software (i.e., SPSS)
Introduction to probability and inferential statistics <u>Note</u> : “Introduction” means understanding of appropriate use, and interpretation of results.	Introduction to Chi-square analysis procedures Introduction to T-test analysis procedures Introduction to analysis of variance procedures Introduction to multiple regression and structural equation modeling (SEM) analysis procedures Introduction to factor analysis and discriminate function analysis procedures	Judge appropriate use of inferential statistical tests Interpret levels of significance and types of errors Use normal distribution tables Interpret and judge appropriate reporting formats for inferential statistics

Community College Leadership Program

Oregon State University

School of Education

A. Guidelines for Selection of Courtesy Faculty for Graduate Program Committee

II.

CCLP doctoral program committees will be made up of five individuals, at least three faculty members at Oregon State University and up to two courtesy faculty members approved by the CCLP faculty, the School of Education, and the Graduate School. Initial approval of CCLP faculty will be made by the Chair of the Department of Adult Education and Higher Education Leadership in consultation, as needed, with the CCLP faculty.

The courtesy faculty members must present evidence of the following nature to qualify for appointment:

1. An earned doctorate in from an accredited institution.
2. Five years experience in significantly responsible positions in higher education and preferably in a community or technical college.
3. Significant scholarly achievement in community college/ education through published articles or books, presentations at recognized education professional organizations, or research and development that have led to educational changes and improvements (i.e., curriculum development, strategic planning, program assessment and accreditation, professional development).
4. Significant service to the education profession, educational institutions, and/or the community.
5. Understanding of and commitment to the community college mission and philosophy or the substantive nature of the dissertation.

Courtesy committee members will be nominated by the doctoral student and will be reviewed and evaluated by the Major Professor and referred to the Chair of the Department of Adult Education and Higher Education Leadership for review and initial approval. The Department Chair may confer with the CCLP faculty as needed. Following initial approval by the Department Chair, the Chair will recommend the courtesy faculty member to the Dean of the School of Education for review and approval. Finally, the courtesy faculty member will be forwarded along with the appropriate documentation to the Dean of the Graduate School for approval and appointment to the Committee.

Graduate Program Review of the Department of Crop and Soil Science

Summary of Findings and Recommendations

The Department of Crop and Soil Science has dealt with formidable challenges through much of its 15-year history, including a long series of budget reductions. Nevertheless, the Department has managed to maintain a strong and productive program. The Department recruits good graduate students and supports them well. According to exit interviews conducted by the Graduate School and a survey conducted by the Department, most students are pleased with their graduate experience in the CSS Department. After completing their degrees, most students are employed in a field related to their studies. By all of these standards, the graduate program in the Department of Crop and Soil Science is successful.

From other perspectives, however, the graduate program in CSS has serious limitations. In fact, it is hard to identify any real “program” on the Departmental level. To a large degree, faculty conduct their own, largely independent mini-graduate programs within the infrastructure of the Department, especially within the Crops unit. The Department as a whole requires that students give a seminar, but other than this and requirements established by the Graduate School, it has no stated requirements, competencies or expectations either for incoming students or for successful graduates. Students choose to study in the CSS Department based largely on the reputation of faculty advisors. For the most part, the students’ individual graduate committees establish expectations for student performance. There appears to be very little coordination of, or indeed, even interest in, the graduate program on the departmental level. The 11-page Strategic Plan that is presented in the self-study report does not contain a single reference to graduate programs. The review team was told, “We’ve taken our [graduate education] system for granted over the years and don’t keep the type of statistics you [are] interested in on an on-going basis.”

To the degree that graduate education is successful in CSS, it is because the highly dedicated and skilled faculty take their mentorship roles seriously. They deserve credit for this. According to a survey conducted by the Department in preparation for the program review, most students are pleased with the amount of attention they receive from their advisors and graduate committees. Although there does not appear to be much of a sense of community among graduate students at the departmental level, students who responded to a survey included in the self-study report said that one of the great strengths of their graduate school experience is the network of peers and faculty that they interact with. In our meetings with students, we learned that this is particularly true for students who are advised by faculty with large, well-established research programs, and that often this network involves peers and faculty in other departments more than in their own department. These inter-departmental connections are laudable, and a great strength in the Department. On the other hand, students with advisors who are less well connected may flounder.

So by one set of standards the graduate program in CSS is highly successful, and by another it is dysfunctional. This dichotomy raises important philosophical questions about the role and management of graduate programs in the rapidly changing, interdisciplinary arena of

environmental and biological sciences. Where should responsibility reside for the articulation and delivery of, and accountability for, excellent graduate programs? It is generally assumed that departments have this responsibility, but in the CSS Department it is clearly the domain of individual faculty, or at most, sub-groups of faculty or self-organized sub-disciplines within the department. Is it impossible, as CSS faculty maintained in a meeting with the Graduate Program Review Team, to articulate a set of common goals and expectations for graduate students in a highly diverse, interdisciplinary department? If so, is it disingenuous even to offer graduate degrees with departmental “labels”? If students and faculty are happy with a graduate program, does it matter, or should we take an “if it isn’t broken, why fix it?” approach, as endorsed by members of the CSS graduate faculty during a meeting with the Graduate Program Review Team?

The Review Team believes that as long as graduate programs formally reside within departments, departments must be accountable for these programs. Accountability includes, 1) A clear articulation of the “products” of the program; i.e., the skills and knowledge expected of all CSS graduates; 2) A recruitment program for students who are likely to succeed in the program; 3) A curriculum (including courses as well as advising and out-of-class learning opportunities) designed to help students achieve the desired skills and knowledge, 4) A mechanism for evaluating whether students achieve the desired skills and knowledge, and 5) A mechanism for evaluating the overall success of the program in achieving items 1-4. Although the graduate program in CSS does have many of these elements, with the exception of a set of four “core” courses in the Soils unit, they appear to be more accidental than deliberate.

From this perspective, the 2004 review committee offers the following recommendations:

Student Recruitment and Selectivity:

- **Characterize a “great student” as a Department and develop a mechanism for evaluating the quality of applicants according to your own criteria (which may or may not include GPA, GRE scores, statement of interest, undergraduate institution, prior research experience etc.)**
- **Maintain consistent records for the total applicant pool, accepted students, and students who accept offers including numbers and data on quality measures. Analyze this information to self-evaluate success in recruitment and identify any trends in changing quality of the applicant pool and accepted students.**
- **For students who are accepted and decline the offer, determine the reason. Maintain records to identify whether there are consistent reasons why students are declining offers. Are students offered higher stipends elsewhere? Are facilities better? Are course offerings more diverse? Attempt to remedy any underlying problems.**

Diversity in the Student Population:

- **Continue strong support for diverse graduate cohorts**

Financial Support of Students:

- As a Department, nominate and support increased number of CSS students for prestigious scholarships, including university and professional opportunities. Learn what it takes to make a strong/successful nomination.
- Continue support for students and pursue ways to increase departmental awards in both CS and SS.
- Make fellowships and scholarships for CSS students a high priority in CAS capital campaigns.

Curriculum:

- Work together as a faculty to define the skills and knowledge expected of all CSS graduates and for each subdiscipline within the Department. In conjunction with external constituencies, identify core competencies of students graduating from CSS. Develop methods to assess those competencies **ACROSS THE DEPARTMENT**. This can include accumulating data on GPA, passage rate of (any) required courses, success rate on comprehensive exams, success with integrated preliminary questions, quantitative and qualitative assessment of the seminar presentation etc.
- Review and update curriculum in light of the defined competencies or expected skills and knowledge. Ensure that students are offered the necessary learning opportunities through formal coursework, out-of-class experiences, seminars, lab rotations, attendance at professional conferences, or informal experiences both from within your department as well as without).
- Remove courses from the catalog that are no longer taught consistently or develop a plan to offer them regularly.
- Review the entire curriculum to identify ways to streamline offerings for a comprehensive undergraduate program in order to free faculty time to develop a coherent and dependable graduate curriculum in the department.
- Consider “remedial” courses required for students without appropriate background.
- Develop a single graduate handbook for both the Crops and Soils units, with links to the specific details for each program. These details should be presented in a common format demonstrating that the programs really are part of the same department.
- Set standards for “slash courses” and periodically review to ensure graduate level expectations and performance. (Note that the Graduate Council has established guidelines to differentiate undergraduate vs. graduate-level learning: http://oregonstate.edu/dept/grad_school/Graduate_Council/outcomes.htm).
- Get serious about your graduate seminar. What are your objectives? What should students get out of the seminar? Where do students learn the presentation skills they are supposed to demonstrate in the seminar? Can they learn or demonstrate the skills through another venue, for example, by presenting a paper at a professional conference?
- Develop partnerships with other units to create opportunities for writing and speaking skills courses for graduate students.

Student Performance:

- Identify criteria for measuring student performance **ACROSS THE DEPARTMENT** and develop methods to consistently track performance. For example, track publications, presentations at professional conferences, successful competition for funding or scholarships, and length of time to complete degree.

Student Concerns:

- Develop and consistently deliver an orientation for incoming students that includes students from both units, regardless of whether one or ten students is entering or which term they matriculate. Consider making this an overnight activity that emphasizes community development.
- Find ways to facilitate development of cohesive cohorts beyond those created by lab/office mates. Orientation, a professional development seminar, and required courses can contribute, but also consider other strategies as well as more intention/attention to integration across departments.
- Review slash courses to ensure graduate level learning opportunities are available to students in their disciplinary field (not just from courses provided in other units).
- Take student participation in department governance more seriously. Consider it part of “professional development” to learn how to participate in meetings, make decisions, and be responsible to others. Mentor students to help them also understand that this is part of their learning experience. Let students participate on all committees (including P&T – they have to learn how this works), have representatives to faculty meetings, etc.

Professional Viability of Graduates:

- Continue providing professional opportunities for students.
- Engage an external advisory board in interactions with students through internships/mentorships, presentations from alumni or other constituents, etc.
- Consider development of a one-credit course on professionalism. The course could cover guidelines for good grant writing, seminar presentation tips, professional ethics, and exposure to the variety of career options available.

Faculty and Research Programs:

- Conduct an internal review to quantitatively evaluate the productivity and accomplishments of CSS faculty relative to similar departments at peer institutions. Share the results with the Graduate Council at the one-year follow-up report from this review.
- Consider diverting resources toward junior faculty to ensure that they develop vital, externally-funded programs that can attract and support good graduate students.
- Continue to encourage faculty to seek opportunities to increase visibility at the national and international levels, and aggressively promote faculty for awards.
- Review the distribution of the teaching load to make sure it is equitable.
- Consider developing strategies to help the citizens of Oregon better appreciate the contributions of your students and faculty to the welfare of the state.

The Scholarly Community:

- Develop compelling themes for seminar series that draw faculty and students from all components of the Department. Consider tasking a graduate student committee (with equal representation from Crops and Soils) to organize the seminar for one

term per year on themes of mutual interest, and provide the students with a small budget to invite outside speakers.

- **Establish an expectation of attendance at departmental seminars.**
- **Use a fall orientation for graduate students (Crops and Soils combined!) as a vehicle to develop a sense of community among the students.**

Introduction

On April 11, 2005, a Graduate Program Review Team (GPRT) visited the Department of Crop and Soil Science (CSS) to review their graduate program. Team members were:

- Barbara Bond, College of Forestry, OSU (chair)
- Denise Lach, Co-Director, CWEST, OSU
- Theresa Filtz, College of Pharmacy, OSU
- Randy Southard, Associate Dean, Division of Environmental Sciences, University of California, Davis (external reviewer).

Although GPRTs typically include a representative from an industry or other major employer of students who graduate from the program being reviewed, no representative from industry or other employer groups was assigned to our team. Consequently, this report does not include an employer's assessment of program quality.

The Graduate Program Review occurred concurrently with a review by the Cooperative State Research, Education and Extension Service (CSREES), and Dr. Southard served on both teams. There were advantages to this concurrent scheduling. Our team benefited from discussions and insights of the CSREES team, and the CSS Department was spared having to host duplicate site visits. Also, it is possible that some aspects of the self-study materials were more detailed than they might have been otherwise due to the larger scope of the review.

However, the concurrent review also posed many problems for the GPRT. We highlight the problems here in the hope that future reviews may be better planned.

- Much of the information requested by the Graduate School for periodic program reviews was missing from the self-study document. It appeared that the process of preparing documents for the CSREES review was so overwhelming that the Department was not able to pay close attention to the requirements of the Graduate Program Review. [The preoccupation with the CSREES review is evidenced in the initial version of the self-study document that was distributed to the GPRT before the site review. In this document, names of the members of the CSREES Review Team are listed on p. 5; the GPRT was not mentioned. This omission was corrected in a final draft that was posted on a web site].
- Graduate Program Review teams generally visit sites for one full day. Our Team visited with members of the Department for the first day of the four-day CSREES meeting. Although the agenda was organized so that graduate programs were emphasized on the first day, and the CSREES team graciously deferred to the GPRT in some of the

discussions, there was less focus on graduate programs during the first day than in “typical” Graduate Program Reviews.

- The GPRT (with the exception of Dr. Southard) missed several discussions on later days of the CSREES visit that might have been useful, including discussions of faculty hired on less than full time appointments, presentations of ideas for curriculum development, meetings with small groups of faculty and exit interviews with faculty, students and administrators. In no case was the GPRT excluded from important discussions. On the contrary, the Department Head graciously extended invitations to the GPRT to all of the CSREES meetings and social events. Our problem was a matter of scheduling. Members of the GPRT were simply not able to attend these meetings.
- Only three graduate students out of a total of about 45 in the Department (all from the Crops side of the Department) showed up for a scheduled 1 hour meeting with the review team. The poor attendance may have been partly due to the location of the meeting – it was on the opposite end of campus from the buildings where the students normally work. It is also clear that strong encouragement to attend the meeting was not sent to students in advance. The three students who attended were thoughtful and articulate, but clearly they did not represent the whole student body adequately. Another meeting between the CSREES team and graduate students was arranged later in the week and the GPRT was invited, but only one member could attend. Although this meeting was well attended, the conversations were dominated by the CSREES team, the timeframe was short, and it was not possible to discuss most topics important to the GPRT.
- The external reviewer, Dr. Randy Southard, was apparently stretched beyond his capacity to serve as a member of both teams. After the site visit, Dr. Southard shared a few very helpful insights via e-mail with the other members of the GPRT, but he was not able to engage in a detailed review as most other external reviewers do. This combined with the lack of an employer representative limited our ability to provide discipline specific assessment.

Detailed Findings

History of the Program

The roots of the Department of Crop and Soil Science go back more than 125 years, although the disciplines were housed in separate departments for most of that time. The current department was formed in 1990 through a merger between the Crop and Soil Science Departments. In 1995, more than 20 extension faculty joined the Department, forming one of the largest academic departments on the OSU campus.

Except for a brief period of increased funding the late 1990’s, the CSS Department has faced serious financial and programmatic challenges for most of its 15-year existence as a combined unit. The merger of Crops and Soils was basically a “shotgun wedding” between groups of faculty with widely differing roles. As examples, Crops research is well supported by the state, and Soils faculty have much heavier teaching loads. As a result of the merger plus additions of the extension faculty and of two faculty from the terminated Entomology Department, the CSS Department is left with “people all over the board”, making it difficult to establish a departmental identity. In addition, there are “spatial challenges”. The Department is housed in four buildings on campus and at 17 locations statewide – it is difficult if not impossible to bring

all faculty together at one time. To deal with this large, dispersed group, the Department operates in a “unit” approach. Administrative functions and undergraduate programs are dealt with on a Departmental basis while graduate programs and many planning functions are separated into “Crops” and “Soils” units.

Results of the last Graduate Program Review

The Graduate Program of the CSS Department was last reviewed in 1994, and the review team offered 13 recommendations to improve the program. It appears the Department has made good progress with some of the recommendations and not with others. Due to a lack of information or insufficient time, the 2005 GPRT was not able to assess progress in some areas. Here is a summary of the 1994 recommendations in categories of curriculum/training and advising, with our findings in italics.

Curriculum and Training

1. Develop guidelines on degree requirements in each of the research areas. *This has been better accomplished for Soils than for Crops.*
2. Involve all faculty in the training of graduate students. *Most on-campus faculty with research/teaching appointments are involved in graduate training. Few extension and off-campus faculty have direct or on-going involvement.*
3. Reevaluate faculty teaching loads, appropriateness of 400/500 courses, and frequency of offering courses. *Teaching loads appear to be distributed inequitably, although it is not clear whether this is a problem (see details later in the report). Slash courses, the frequency of course offerings, and the diversity of course offerings remain problematic.*

Graduate Students and Advising

1. Provide a structured departmental orientation for new students. *Faculty claim that this is being done but students disagree. The Soils unit is apparently offering orientations more consistently. Sessions have been planned the last three years in the Crops unit but were cancelled in two years due to low student numbers.*
2. Develop a graduate student organization. *There is no graduate student organization on the departmental level.*
3. Provide for a student representative on faculty committees. *The self-study report shows that many faculty committees include students. Students report that they have little involvement in committees. This is discussed in more detail later in the report.*
4. Develop a mechanism to allow graduate students to have teaching opportunities. *This is being done well in Soils as there are numerous opportunities for students to assist as lab instructors in basic soils classes. There are fewer on-going opportunities in Crops.*

Graduate Admissions, Teaching and Advising

Student Recruitment and Selectivity:

The Department relies on faculty to recruit students, and does little in the way of recruitment on the Departmental level or even within the separate Crops and Soils units other than annual, general solicitations at professional meetings. As one faculty member said, “If you are creative,

you are a go-getter, then you will have students.” The primary recruitment method for both Soil and Crop Science units is through contact with a potential major advisor.

The Department has instituted a “pre-application” approval process. The Department assesses whether students will be accepted into the program before they actually submit an official application. Acceptance depends mostly on whether a faculty member has a project and/or funds to support a student. While this process may create extra work for faculty, it provides prospective graduate students an early read on the likelihood of their acceptance into the program and helps avoid unnecessary application fees for students who are denied admission when there is no good faculty match. The pre-application process is laudable, but it is difficult to assess the acceptance rate of students (one measure of selectivity) and the quality of the students who don’t accept offers from the Department.

A measure of success in recruitment is the proportion of “accepted” students who decide to enter the program or to reject the offer. On request, the GPRT was provided data for 1999-2000, 2002-2003 and 2003-2004 showing the number of students accepted, admitted, and admitted but choosing to go elsewhere. According to these data, for the Crops and Soils units, respectively, an average of 36% and 32% of students accepted to the program did not accept the offer during these years. These statistics may indicate that many students are accepted to the program but are not “picked up” by major professors (it is a policy of the Crops unit to accept students and then wait for professors to select them). On the other hand, a faculty member told us that it is “more challenging to recruit graduate students now. We have very attractive offers, but last year 1 of 3 we offered turned us down”. This statement seems in contradiction to a statement by the Department Head that the Department had no trouble attracting as many high quality students as they could support. It appears that the Department needs to pay closer attention to its recruitment process.

It appears from the information provided by the Department that there has been a declining number of students interested in CSS Department over the past five years. In 1999-2000, 330 potential students enquired about the program and were sent an information packet. In 2002-2003 the number dropped to 154, and in the following year to 88. According to the external member of the review team, this may be a general trend in soils and crops programs at both the undergraduate and graduate levels. However it is also possible that moving graduate information to a departmental web page confounds these numbers. With more information about the program available on-line, it is likely that fewer students will make general requests to the Department to be sent materials.

The quality of the incoming students is high, according to faculty. The GPRT has no reason to doubt this assessment, although it appears that the Department does not generate information that would allow us to make an independent assessment.

The faculty appear to believe that the minimal requirements for graduation are an attractive feature of the CSS Department and gives an advantage in recruiting. This may be a dangerous assumption – it is also possible that the low requirements simply attract students who avoid challenges.

Recommendations:

- Characterize a “great student” as a Department and develop a mechanism for evaluating the quality of applicants according to your own criteria (which may or may not include GPA, GRE scores, statement of interest, undergraduate institution, prior research experience etc.)
- Maintain consistent records for the total applicant pool, accepted students, and students who accept offers including numbers and data on quality measures. Analyze this information to self-evaluate success in recruitment and identify any trends in changing quality of the applicant pool and accepted students.
- For students who are accepted and decline the offer, determine the reason. Maintain records to identify whether there are consistent reasons why students are declining offers. Are students offered higher stipends elsewhere? Are facilities better? Are course offerings more diverse? Attempt to remedy any underlying problems.
- Develop recruitment materials for the graduate programs with specific information about the faculty and the research they do. These materials can take the form of brochures for use at conferences and meetings, and web pages for students who are cruising for graduate programs.

Diversity in the Student Population:

The GPRT commends the CSS Department on their diverse student body. There is a significant international cohort of students as well as a large number of students who are minority and/or women.

Recommendations:

- Continue strong support for diverse graduate cohorts

Financial Support of Students:

With the exception of the MS in Environmental Soil Science program, all graduate students receive some level of financial support. During 2003-04, for example, about 72% of students had “full” GRAs (tuition and .49 FTE), which is commendable. During exit surveys, more than 2/3 of graduating students reported that they were satisfied or very satisfied with the level of support they received from the department.

Resources for graduate support are provided through a variety of sources, including two IGERTs (NSF graduate training grants), Microbial Observatory, CSREES, NSF, European Community, foundations and grants from individual faculty members. The Soil Science unit has two merit GRA positions (.49 FTE for one year – faculty member provides funding after year one) and a limited number of TA positions. In discussions, the GPRT learned that there are also two or three scholarships available from the CAS, but it is not clear whether these scholarships are awarded to CSS students. Although the funding status appears to be very good, the level of graduate student support through scholarships and fellowships provided by the Department or

College is low considering the potential support from agricultural interests. Small supplemental scholarships awarded to meritorious students to supplement GRA support might enhance the appeal of the Department to highly qualified students.

The Department provided no information about the success of CSS students in obtaining scholarships outside the Department or College. The GPRT requested information from the Graduate School about the number of their scholarships and fellowships that have gone to CSS students. It appears that CSS students are encouraged to apply for university-wide and professional scholarships. In recent years, CSS grad students have had little success with the highly competitive Bayley and Yerek fellowships. Most CSS students who applied for those fellowships received ratings that place them in the low to middle range of the pool. This changed in 2004-05 when CSS students were more highly ranked, although due to lack of funds, they did not receive awards. CSS students have fared a bit better in the Oregon Sports Lottery Graduate Scholarship, receiving at least one scholarship from this source in the past three years. (Its important to note that 84% of funding available from the university is in the form of tuition remission so if most CSS students receive support from grants they are not eligible for many forms of university support.)

Recommendations:

- **As a department, nominate and support an increased number of CSS students for prestigious scholarships, including university and professional opportunities. Learn what it takes to make a strong/successful nomination.**
- **Continue support for students and pursue ways to increase departmental awards in both CS and SS.**
- **Make fellowships and scholarships for CSS students a high priority in CAS capital campaigns.**

Curriculum:

Separate graduate handbooks have been developed for the Crops and Soils units to describe curricula and requirements. Both are available on-line. The Crops handbook provides information about the credits required, which appear to be the same as requirements of the Graduate School. The GPRT was told that there is a seminar requirement in Crops but this is not in the Handbook. The Soils handbook is organized completely differently. It does not repeat the Graduate School's credit hour requirements, but it does describe requirements for oral communication and teaching.

Currently there are no required courses in CSS except enrollment in a one-term seminar during which each student presents a paper. Students' programs are devised by the student in consultation with his/her advisor, although there is some evidence that among the Master's students that this does not happen on a timely basis. When asked, faculty were not able to describe either generally or specifically what a graduate from their program should know or be able to do (or what particular classes they should take). No common set of competencies has been articulated, although again when asked, faculty agreed that each student should be able to communicate orally and in writing. On the other hand, faculty noted that there were no courses or other training in the Department to help students attain these skills. The GPRT assumes that

students are also expected to be methodologically sophisticated and able to design/critique research projects, and that faculty would readily agree that a primary function of the thesis or dissertation is to develop these skills. However, it is surprising that there have never (apparently) been any discussions among the faculty to articulate exactly what they expect from students or how they will provide students with learning experiences to meet these expectations.

Faculty expressed resistance to developing a core curriculum or core set of competencies for all of CSS, claiming that everyone's work is so different that it doesn't make sense to have requirements. In the Crop Science unit, there are no competencies or course expectations other than the 1 credit departmental seminar. In the Soil Science unit, on the other hand, students are expected to master four "core" areas (soil biology, soil physics, soil chemistry, and soil morphology). Students are not required to take any courses in these areas, but their knowledge of these topics is assessed in preliminary and final exams. It is believed that most students end up taking the courses in order to pass the exams. Students in the Masters in Environmental Soil Science track (MS-ESS - about 1/3 of the students in Soil Science) are not required to take any professional development courses although the stated goal of the program is to have students ready for public or private careers in professional jobs.

Students reported that while they initially liked the flexibility of having no specifically required courses, ultimately they would have liked more direction and structure as they moved through their program. With responsibility for recruiting and funding students, helping set research topics, and serving as the student's employer, the primary advisor (who is also a principal investigator) has a great deal of influence over a student's education. Thus, graduate student experiences are highly variable depending on their advisors, and the GPRT infers that the criteria for completion of graduate degrees are highly variable depending on advisors and committees.

There are few "stand alone" graduate courses in CSS; most courses are taught as "slash courses" (i.e., 400/500 level courses). The quality of graduate education in these courses is variable, and we heard from students that expectations for the amount or type of work required and/or the topics covered in the graduate version of the course are only slightly different from the undergraduate version. They have taken many courses, for example, where the graduate component of the class was to write a longer paper than the one assigned to undergraduates. These students were very concerned about the quality of the classroom experience in slash courses, describing it as "not especially stimulating." The department relies on other departments and colleges to provide graduate courses for their students (e.g., statistics, writing, plant physiology) although some faculty mentioned that these courses were hard to find. The outside reviewer noted that there are relatively few graduate level courses offered on a regular basis (especially 600 level courses). It is clear that faculty are working to fill gaps left by retirement and resignations, but the graduate curriculum may be losing its coherence.

All CSS students are required to attend a one-term seminar series during which they make a presentation, although there was a difference of opinion about this requirement. Most students claimed that they were only required to give their own seminar, not to attend a series of seminars. The student handbooks imply that students must attend a term-long series. According to faculty, the goal of the seminar is professional development and experience in public

speaking; however, students claimed that they receive little formal training in preparing and making scientific presentations, and say that they generally receive no feedback at all after their presentations. Hand-outs about professional development are distributed to students during the seminar and it is expected that major professors will assist with the seminar. We heard from both students and faculty that this is not always the case. Neither faculty nor students could articulate the effectiveness of this seminar in helping to professionalize students.

Some faculty reported that they knew that they should reexamine their curriculum and core competencies but claim a lack of time and resources for doing so. Some faculty from the Soils unit said they had initiated such discussions some time ago, although others seemed not to remember. Indeed, the foundation of the graduate program in Soils is much stronger than in Crops. Apparently there have never been such discussions within the Crops unit, much less for the Department as a whole. Faculty say they would like to see more direction and assistance from administration before they tackle the issue.

Last year as part of a course, a group of graduate students in Crop Science and other programs developed a plan for a graduate program in plant breeding. We commend the course instructors for this creative involvement of graduate students in curriculum planning. The plan is interesting, and if nothing else demonstrates a strong desire on the part of the students for more educational opportunities. The CSREES review team was excited at the prospect of an interdisciplinary plant breeding and genetics program and suggested that such a program might be unique in the nation. Because this plan would require new financial resources from multiple departments, it would require significant administrative support. We encourage administrators in CAS to team with their counterparts in other colleges to seriously consider support for a program like this.

Recommendations:

- **Work together as a faculty to define the skills and knowledge expected of all CSS graduates and for each subdiscipline within the Department. In conjunction with external constituencies, identify core competencies of students graduating from CSS. Develop methods to assess those competencies ACROSS THE DEPARTMENT. This can include accumulating data on GPA, passage rate of (any) required courses, success rate on comprehensive exams, success with integrated preliminary questions, quantitative and qualitative assessment of the seminar presentation etc.**
- **Review and update curriculum in light of the defined competencies or expected skills and knowledge. Ensure that students are offered the necessary learning opportunities through formal coursework, out-of-class experiences, seminars, lab rotations, attendance at professional conferences, or informal experiences both from within your department as well as without).**
- **Remove courses from the catalog that are no longer taught consistently or develop a plan to offer them regularly.**
- **Review the entire curriculum to identify ways to streamline offerings for a comprehensive undergraduate program in order to free faculty time to develop a coherent and dependable graduate curriculum in the department.**

- Consider “remedial” courses required for students without appropriate background.
- Develop a single graduate handbook for both the Crops and Soils units, with links to the specific details for each program. These details should be presented in a common format demonstrating that the programs really are part of the same department.
- Set standards for “slash courses” and periodically review to ensure graduate level expectations and performance. (Note that the Graduate Council has established guidelines to differentiate undergraduate vs. graduate-level learning: http://oregonstate.edu/dept/grad_school/Graduate_Council/outcomes.htm).
- Get serious about your graduate seminar. What are your objectives? What should students get out of the seminar? Where do students learn the presentation skills they are supposed to demonstrate in the seminar? Can they learn or demonstrate the skills through another venue, for example, by presenting a paper at a professional conference?
- Develop partnerships with other units to create opportunities for writing and speaking skills courses for graduate students.

Student Performance:

It is not clear from the materials provided to the GPRT or from the interviews with faculty and students whether graduate student performance is tracked by the Department as a whole. Formation of program committees, research topic selection, and preliminary exams are all decentralized and dependent on the major advisor/project PI. The Department does not appear to collect information about graduate student performance beyond transcripts, so it is difficult for the GPRT to assess performance. According to the 2004 exit survey of graduate students, about $\frac{3}{4}$ of CSS students reported that they took about the length of time they expected to finish their degree.

For the Preliminary Exam in the Soils unit, Ph.D. candidates are asked to prepare a proposal that is completely unrelated to the students’ work. This is a great way to evaluate students’ problem solving skills. Also in the Soils unit, all PhD students have to take an exam that covers the major areas of soils, (biology, morphology, physics, etc). However, there appears to be no consistent, systematic method for evaluating students on their depth of understanding of the subject matter of their dissertation or other general knowledge during this exam. One Soils faculty member noted that this is “a big blank hole”. In Crops there do not appear to be any mechanisms for evaluating performance of current students other than observations by advisors. Annual reviews of students on assistantships are conducted by supervisors, but these reviews are seldom carefully reviewed at the Departmental level; no systematic review process is in place for students on scholarships or with other sources of funding.

Recommendations:

- **Identify criteria for measuring student performance ACROSS THE DEPARTMENT and develop methods to consistently track performance. For example, track publications, presentations at professional conferences, successful competition for funding or scholarships, and length of time to complete degree.**

Student Concerns:

Only three graduate students – two Ph.D. and one M.S. - met with the entire GPRT during the site review, and all three students were from the Crop Science unit. In a short follow-up meeting, 23 students met with the CSREES team and one of the GPRT members. Comments from both meetings are presented here, although there is emphasis on the first meeting because there was more time for a productive conversation.

Students perceive that Crop and Soil Science units are two separate entities; in fact, they often used the terms “Crops Department” or “Soils Department” to describe the units. They claim they have few contacts with students or faculty in the program in which they are not enrolled. The physical separation may lead to separate orientations. Students believe that there are effective ways to collaborate across the departments, although they claim there are no opportunities for this. Students at the first meeting said they would like to see social events, courses and seminars that are shared across the programs. However, a student at the second meeting said, “the administration has tried to make things happen – they send emails about pot lucks, etc. But students are very busy. They do not put out the effort to attend. This may be partly because when they do attend, there are no introductions to bring people together.” When students at the second meeting were asked to rate the level of camaraderie within their units (as separate units, not as a whole department) on a scale of 0 to 10 (with 10 being excellent), responses from Crops students ranged between 2 and 4. Soils students agreed on a rating of “less than 5 out of 10”. However, students also agreed that within individual lab groups the level of camaraderie is often very high.

Another concern raised by students is the unevenness of orientation/direction for graduate students – this is highly dependent on who the major advisor is and what project the student is working on. As one student described it, “each major professor seems to have gotten a different memo about what’s required.” Another Master’s student claimed that she hadn’t had direction regarding setting up a committee (well into her second year) and doesn’t feel that the graduate handbook is particularly clear about how to do this. Students were also concerned that the amount of work required for a GRA varies by major professor – they believe it depends on whether the student is perceived by the PI as a grad student or “employee” on the project. Students treated as “employees” are concerned that their graduate training takes a back seat to the needs of the project. Students also reported that not everyone receives a regular evaluation so they may not be clear about the progress that is expected and/or how well they are doing.

Students also have concerns about the curriculum. They reported that there were few course offerings, but the few available had considerable “overlapping material”. They described this as inefficient use of faculty and a waste of time for students. They would like teachers to coordinate and integrate course work to the extent possible. Another concern is that they see course prerequisites not being enforced, allowing students without the necessary background to take advanced courses. They believe this results in a general “dumbing down” of CSS courses. In combination with the slash courses dominating their programs, graduate students believe that much of their CSS course work does not and cannot meet their needs.

As discussed above, one student told us that she came to OSU because of the flexibility in designing her program but with some reflection she now believes that she should have had a few more required courses to get the breadth of knowledge in the field. Another echoed these concerns, believing that she will be extremely “well trained” in the research field she’s working in but not trained broadly enough to be comfortable teaching outside this specialized area.

Graduate students do serve on departmental governance committees, but report that committees rarely meet and/or they focus on items of little concern to graduate students. The graduate students we spoke with at both meetings did not realize the value of committee service to their professional development. When asked whether they had sufficient input into the decision-making of the Department, a student at the second meeting answered, “Yes, we work through out major profs.” Other students concurred. According to the CSS graduate survey, graduate students do not see a “well-established mechanism for regular graduate student involvement in department decisions affecting them.”

In a summary statement, students report that they have had generally outstanding experiences interacting with their major professors. This is echoed in the exit survey where students report satisfaction with the support provided by their major professor including finding funding, help in finding employments, and assistance on research and writing projects. Students also believe, however, that the CSS Department has lots of unrealized potential that could be met through integration across the programs. They report that the departments “hasn’t quite figured out how to take advantage” of great people and good lab conditions to facilitate work across programs, create a strong graduate curriculum, and increase connections between crop and soil science.

Recommendations:

- **Develop and consistently deliver an orientation for incoming students that includes students from both units, regardless of whether one or ten students is entering or which term they matriculate. Consider making this an overnight activity that emphasizes community development.**
- **Find ways to facilitate development of cohesive cohorts beyond those created by lab/office mates. Orientation, professional development seminar, and required courses can contribute, but also consider other strategies as well as more intention/attention to integration across departments.**
- **Review slash courses to ensure graduate level learning opportunities are available to students in their disciplinary field (not just from courses provided in other units).**
- **Take student participation in department governance more seriously. Consider it part of “professional development” to learn how to participate in meetings, make decisions, and be responsible to others. Mentor students to help them also understand that this is part of their learning experience. Let students participate on all committees (including P&T – they have to learn how this works), have representatives to faculty meetings, etc.**

Professional Viability of Graduates:

Faculty claim that placement of students is “exemplary” although it is difficult for the GPRT to assess this from the materials provided us. Of the 35 students in the MS-ESS track, 13-15 have

found work in natural resource agencies, 13-15 are working in private consulting practices or firms, and the remaining have taken academic positions. About 2/3 of the graduates reporting in the 2004 exit survey said that they were “very prepared” to begin their career or to move on to a higher degree program. However, the students we spoke with indicated that most students receive little mentoring or preparation to help them prepare for future careers.

Recommendations:

- **Continue providing professional opportunities for students.**
- **Engage an external advisory board in interactions with students through internships/mentorships, presentations from alumni or other constituents, etc.**
- **Consider development of a one-credit course on professionalism. The course could cover guidelines for good grant writing, seminar presentation tips, professional ethics, and exposure to the variety of career options available.**

Faculty and Research Programs

There were few discussions about faculty and research programs during the one day of the GPRT site visit, so our findings are mostly limited to information available in the self-study report.

CSS is a large department, including 27 professors, 15 associate professors, 15 assistant professors, 9 instructors and a large and fluctuating number of research associates and assistants. There are also a large number of professional faculty and courtesy/affiliate faculty. It is beyond the capacity of the GPRT to analyze all of the faculty vitae in detail, and no summaries were provided of research quality or productivity.

In the opinion of the external reviewer, the faculty are high quality and fairly competitive in attracting external support. The younger faculty are on good trajectories. Some of the senior faculty are well-known for their disciplinary contributions, and are recognized as fellows in their scientific societies. The Department notes that \$2.1M in state and federal external funding was obtained in 2003-2004. This amounts to close to \$40,000 per faculty member, or \$100,000 per research FTE (AES). This is a respectable number, but a comparison with national averages for similar departments elsewhere would be useful. We do not know how the success in securing grants is distributed across units (Crops, Soils, Entomology, etc.). In the Accomplishments and Impacts statement of the self-study report (p 239), the Department notes the scholarly accomplishments of their faculty include “service on national review panels, invited presentations at national and international meetings, national and regional awards, and leadership of regional and national professional organizations.” All of this is admirable and suggests a healthy program. However, an enumeration by year of the number and nature of awards, peer-reviewed faculty publications, patent applications, number of presentations, review panels attended or chaired, and other quantitative data would allow for a better evaluation of faculty productivity.

Over the past decade, many faculty in CSS have either retired or resigned to take other positions. Many of these positions have not been refilled, leaving disciplinary gaps. In the past year alone, two faculty members left the CSS Department (one from the Crops unit and one from Soils unit)

to take prestigious positions with generous financial support at other institutions. Both of these faculty members maintained very productive research programs that supported a large number of graduate students. In the short term, at least, these losses are bound to have a negative impact the graduate program. On the brighter side, the Department is now hiring ten new faculty positions. With time, these new faculty will likely invigorate the graduate program. At the same time, CSS, like many other OSU departments, will continue to lose top faculty unless salary and research support are brought up to the levels of peer institutions. There is little that CSS can do about this in the short run; the poor funding situation ultimately boils down to budget constraints and priorities in Salem. However, the Department provides huge benefits to the people of Oregon that are largely unrecognized, and should consider ways to get this message out to a broad audience.

Faculty who met with the GPRT during the site review appeared to represent a healthy balance of gender and ethnicity. According to data provided after the site visit, the academic CSS faculty eligible to direct masters or doctoral thesis students (55 total) is 14.5% female and 11% non-white, with the under-represented groups concentrated in the assistant professor category. This demographic distribution may reflect a determined and laudable effort in recent years to increase faculty diversity. According to our analysis, female and non-white faculty are major thesis advisors for a larger percentage of graduate students (30% and 17 % respectively) than expected based on representation. Graduate student distribution may reflect a disproportionate success rate among women and ethnic minority faculty to obtain grant support necessary for graduate student mentorship.

Based on descriptions in the self-study report of faculty duties by FTE category (E&G, EX, AES), it appears that the majority of the teaching burden is shouldered by the relatively small number of female faculty. This may be a misperception by the GPRT based on the way that budgets are allocated to faculty. If this is the case, the teaching load of each faculty member should be more clearly presented in future program reviews. Has the department conducted a parity review in the past ten years?

Recommendations:

- **Conduct an internal review to quantitatively evaluate the productivity and accomplishments of CSS faculty relative to similar departments at peer institutions. Share the results with the Graduate Council at the one-year follow-up report from this review.**
- **Consider diverting resources toward junior faculty to ensure that they develop vital, externally-funded programs that can attract and support good graduate students.**
- **Continue to encourage faculty to seek opportunities to increase visibility at the national and international levels, and aggressively promote faculty for awards.**
- **Review the distribution of the teaching load to make sure it is equitable.**
- **Consider developing strategies to help the citizens of Oregon better appreciate the contributions of your students and faculty to the welfare of the state.**

The Scholarly Community

In an attempt to develop a scholarly community, CSS holds an annual fall one-half to full day meeting in conjunction with University Week and a 3-4 day spring meeting during exam week of winter term. It is seldom possible to bring more than half to two-thirds of the 100+ professorial and professional faculty together. Monthly meetings are typically held within each unit but off-campus faculty are seldom able to participate in these sessions. A multiday, off-campus retreat has typically been held every 5-6 years.

A cornerstone of the scholarly community for most healthy departments is a weekly departmental seminar. The CSS seminar does not seem to be popular among faculty or students. In the fall, the seminar is mostly devoted to faculty presentations as part of the promotion and tenure process (the Department typically has 6-8 faculty up for promotion and/or tenure in a given year) or to required student seminars. The winter term is devoted to plant breeding and genetics. The spring term is devoted to soils. External speakers appear to be rare. There appears to be little effort to develop themes that could attract a broad spectrum of the Department. Competing “community of interest” seminars in plant breeding and genetics, MCB, CGRB, hydrology and other areas vie for time that faculty are willing to commit to seminar participation on a weekly basis.

On the other hand many faculty have excellent collaborations and communications with faculty in other departments and, indeed, at other institutions. CSS faculty co-teach courses, co-author grant proposals and papers, and share laboratory space with faculty in other departments. Graduate students report that they regularly attend seminar series in other departments or programs on campus (such as molecular biology). These are wonderful connections.

Recommendations:

- **Develop compelling themes for seminar series that draw faculty and students from all components of the Department. Consider tasking a graduate student committee (with equal representation from Crops and Soils) to organize the seminar for one term per year on themes of mutual interest, and provide the students with a small budget to invite outside speakers.**
- **Establish an expectation of attendance at departmental seminars.**
- **Use a fall orientation for graduate students (Crops and Soils combined!) as a vehicle to develop a sense of community among the students.**

Facilities

The GPRT was not able to tour facilities due to a lack of time. We were told that plant growth facilities (greenhouses/growth chambers) are very old, limited, and expensive to replace. Office space for both students and faculty, laboratory facilities, and computer support appear to be adequate.

Administration

The Department of Crop and Soil Science is very large. As far as the review team can determine, department administrators, especially Department Head Russ Karow, are doing a fine

job. But their challenges are formidable. The GPRT wonders whether the Department is too large and varied to offer a cohesive, integrated graduate program.

The CSREES review team is offering a number of additional comments and suggestions concerning Administration.

Chemical Engineering Graduate Program Review

Summary of Findings and Recommendations

RECOMMENDATIONS

1. Faculty - The department should consider establishing a goal of doubling the external research support per faculty, as this will translate into increased GRA support for graduate students.
2. Faculty - More emphasis should be placed on nominations of faculty for national and international awards that will provide visibility for the program and the graduate program.
3. Graduate students - To be consistent with nationally recognized programs, the Department would need to increase the size of its Ph.D. program by several fold. While this may be a very long-term goal, an intermediate goal should be to make a concerted effort to increase the size of the Ph.D. program beyond the proposed increase to 50% of the graduate student body. The Department should develop strategies for recruiting graduate students broadly across the country, with a focus on Ph.D. recruitment.
4. Graduate students - The involvement of graduate students on Departmental Committees and a graduate student representative at faculty meetings should be carefully considered. Graduate students can provide a unique perspective to committees and the experience provided to the graduate student makes these efforts worthwhile.
5. Courses - The structure of coursework in the Ph.D. program should be reassessed in view of the possible integration of Environmental Engineering faculty. Whether or not graduate students with interests in Environmental Engineering are served by the Chemical Engineering framework should be evaluated if/when integration is approved.
6. Courses - Although the Review Committee is strongly supportive of the suggested merger of Environmental Engineering faculty with Chemical Engineering, there are likely to be differences in cultures between the two fields. This came to the attention of the Review Committee through comments made by students regarding graduate courses in a Chemical Engineering subject taught by faculty external to the Department. The perception of the students was that such courses were taught at a lower level than they would be if taught by a chemical engineer. The Department must ensure that appropriate faculty teach courses at the graduate level.
7. Courses - The Department needs to expand its offering of 500 and 600 -level graduate courses to provide greater breadth and depth for its students, and reduce dependence on 400/500 courses for graduate education.

8. Courses - The Department should consider starting a seminar series that brings to campus academic, government and industrial speakers. Although this does require resources, in the early years it may be possible to tap scientists, engineers, and practitioners in Oregon for a high proportion of the talks.

9. Courses - One way to build visibility of the Department and increase the course offerings is by offering short courses taught by visiting faculty. It might be possible, for example, to invite well-known faculty from other universities to visit OSU and give lectures over, say, a week. Students would take these courses for credit.

10. Resources - The funding model for GRAs and GTAs needs to be reviewed and reconsidered so that nationally competitive offers can be made. Most other major universities allow the inclusion of student fees into the budgets of grants.

11. Resources - Funding for GTAs needs to be considered from the standpoint of providing stipends that do not penalize students who might move from the GRA title to the GTA title.

12. Resources - Graduate student offices and desk space is very limited and common space is of low quality. These areas should be reviewed carefully and resources invested to bring graduate student offices to reasonable standards.

Introduction

On March 1, 2005 an all day review was conducted of the Chemical Engineering Graduate Program. The Graduate Council Review Committee consisted of:

Lynda Ciuffetti (Chair), Graduate Council, College of Science
Daniel Rockey, Graduate Council, College of Veterinary Medicine
James Carrington, Director, Center of Gene Research and Biotechnology
Robert Powell, External Reviewer, University of California Davis
Gregory Herman, External Reviewer, Hewlett Packard, Corvallis

In addition, Sally Francis (Dean of the Graduate School) and Bruce Rettig (Associate Dean of the Graduate School) attended the review.

The last review of this program was held on April 12, 1985 and presented to the Graduate Council on May 23, 1985.

The committee began the day with a planning meeting at the Harrison House where members introduced themselves and collectively evaluated the strategy for the day. We then met with several groups in succession, including Ken Williamson (Chair, Department of Chemical Engineering), a group of Graduate Students (number varied from 5-9 over the hour), Ron Adams

(Dean of the College of Engineering), a group of Graduate Faculty in the department (11 faculty in attendance), and Rich Holdren (Vice Provost for Research). The committee also had a tour of the facilities and had an opportunity to meet with Dr. Williamson at the end of the day for an exit interview. The committee is confident that their experience, in conjunction with printed material delivered to the graduate school, was adequate to evaluate the program.

Dr. Williamson presented a self-study report to the graduate school two weeks prior to the site visit. This detailed self-study is a valuable document that contains candid assessments of strengths and weaknesses within the group. The graduate program in Chemical Engineering has undergone a rebirth in conjunction with the expansion of research efforts in the 1990's. There has been significant change between then and now, much of which has direct impact on the breadth and depth of the program. First, energies toward interacting with the electronics industry and bioengineering/environmental remediation have been increased, while energies toward the pulp and paper industries have declined. In yr 2000 the Department doubled its enrollment with the addition of the Bioengineering Program from the College of Agricultural Sciences. This has apparently had mixed effects on the graduate program in the department. In the end, the move has added new and diverse faculty to the research group. The Program in Biomedical Engineering did not, however, materialize from this move. This was the apparent result of a lack of funding and a lack of interest in such a program.

The Department was challenged by administrative troubles in the late 1990's. However, the past few years have seen significant evidence of positive development emerging in the Department. This progress is primarily in association with the positive leadership provided by Dr. Williamson. There have been several changes leading to an increased focus on research, which has led to increased opportunities for graduate student research. The self-study report suggests that changes in the Department within the past few years are such that any goals or results set or expected prior to yr 2000 are largely irrelevant.

The Department sees current and future research strengths within the areas of biomaterials, bioprocessing, microelectronics processing, micro/nanotechnology, and chemical processing. Specific needs for each of these areas is listed in the self-study report (pages 5-7). The faculty anticipate that the recent addition of bioengineering, the planned addition of environmental engineering, and the interaction with the ONAMI program will continue to add strength and opportunities for interaction that will have very positive effects on the graduate program.

Detailed Findings

The evaluation of the Graduate Program focused on comparative measures with other programs and its competitive position. These are broken down as: (1) Faculty; (2) Graduate students; (3) Graduate courses and program requirements; (4) Resources; (5) Other issues.

FACULTY

Composition of the faculty include: 4 Professors (including the Chair), 8 Associate Professors, 2 Assistant Professors, and 5 Affiliated Chemical Engineering Faculty. All Chemical Engineering

faculty are graduate faculty. Department funds support 7 FTE with E&G funds, 6 FTE from targeted funds, and 1 faculty position through a funded chair.

There are various quantitative measures that might be used to “measure” the quality of the faculty, e.g., funding per faculty, or refereed publications per faculty. Other quality measures are more directly connected to external recognition and the future potential of the Department. These include faculty awards (both internal and external, although the external awards are more important for external recognition), impact of publications, and key grants.

Faculty have been educated at some of the top chemical engineering departments. In addition, the Department has embraced faculty from other disciplines, such as chemistry. This is a very positive trend and reflects the make-up of the best departments of chemical engineering. An additional very positive development is the potential integration of environmental engineering with chemical engineering. This promises to create a relatively unique Department. It is also a very logical development. Environmental engineers use many of the theoretical and practical tools that were pioneered by chemical engineers such as kinetics, flow in porous media, and suspension mechanics. The cross fertilization that will result from this combination has the opportunity to position the Department as a leader on topics such as sustainability and green engineering, areas of special interest to Oregon.

Faculty within the Department have received recognition at the College and University level through various awards. Some faculty have been recognized through prestigious grants, such as NSF CAREER Awards and Research Initiation Grants. A few have also received national awards not associated with grants. At the same time, it appears that there are many faculty for whom this recognition has not resulted in appointments at an appropriate level. In particular there are many faculty at the Associate Professor level for whom a promotion to Professor would appear warranted. It was suggested in one interview that this might be a result of poor and fractured leadership over the last decade. This should be assessed and if true, corrected. Further, as the Department matures, more emphasis should be placed on awards that will provide national visibility to the faculty. Many Departments have Award Committees that operate to this end.

In terms of other measures of faculty “quality”, the funding for extramural research per faculty is low. Assuming that increases in funding would imply commensurate increases in the number of graduate students and post-doctoral fellows supported, a doubling of the support per faculty appears to be a good long-term goal. The number of publications per faculty per year is about 2.5. This is slightly below average, however, it is always important to judge the quality of the work not necessarily the number of publications. This review did not focus on this issue, and it is sufficient to conclude that half the faculty are publishing at a rate that is consistent with top universities while four more are just slightly underperforming, based solely on the number of publications.

Recommendations

- The department should consider establishing a goal of doubling the external research support per faculty, as this will translate into increased GRA support for graduate students.
- More emphasis should be placed on nominations of faculty for national and international awards that will provide visibility for the program and the graduate program.

GRADUATE STUDENTS

Chemical Engineering is a small department that has historically provided excellent undergraduate education. The department is successfully increasing the visibility of its graduate program, and will continue to improve especially with the addition of biochemical engineering. The reputation of a graduate program is primarily based on its Ph.D. program. The Chemical Engineering Ph.D. program is by any measure quite small, less than one student per faculty. To be consistent with nationally recognized programs the Department would need to increase the size of its Ph.D. program by several fold. While this may be a very long-term goal, an intermediate goal should be to make a concerted effort to increase the size of the Ph.D. program beyond the proposed increase to 50% of the graduate student body. This is critical to the success of sponsored research programs. While the M.Sc. program need not be downplayed, the major effort must be on the Ph.D. There appears to be some opportunity for this as the quality of the graduate students has been increasing.

Although the graduate student community was viewed by students to be small, students felt the group had strong social bonds. The Review Committee was impressed by the general energy and cohesiveness put forth by the students in our discussion, although we only talked to a small subset of the total graduate student population. All things considered, the graduate students present at the meetings appeared to be satisfied with their choice to obtain their graduate degree in this Department at OSU.

While the overall presentation in the self-study was generally very good, at least one reviewer was overwhelmed with the 100+ pages of exit data for the past graduate students. This was an analysis of a total of 10 students. It seems these data perhaps were overworked and overanalyzed. Additionally, there was no real summary of what any of these data purportedly meant.

Dr. Williamson stated in a supplementary document that there would need to be an increase of 5 faculty to begin to approach the “top 25” goal of the College of Engineering. This would be a huge step in the right direction that would greatly assist the graduate program.

Recommendations

- To be consistent with nationally recognized programs, the Department would need to increase the size of its Ph.D. program by several fold.
- The Department should develop strategies for recruiting graduate students broadly across the country, with a focus on Ph.D. recruitment. Does the department focus on specific regions, schools, and/or research groups for recruitment?
- The involvement of graduate students on Departmental Committees and a graduate student representative at faculty meetings should be carefully considered. Graduate students can provide a unique perspective to committees and the experience provided to the graduate student makes these efforts worthwhile.

GRADUATE COURSES AND PROGRAM REQUIREMENTS

The Department has a curriculum that is consistent with national programs. There are some specific suggestions that result from the discussions with the faculty and students.

Although the Review Committee is strongly supportive of the merger of the environmental engineering with chemical engineering, there are likely to be differences in cultures between the two disciplines. This came to the attention of the Review Committee through comments made by students regarding graduate courses in a chemical engineering subject taught by environmental engineers. The perception of the students was that such courses were taught at a lower level than they would be if taught by a chemical engineer.

The Graduate Students discussed the format of preliminary exams and oral exams with the Review Committee. Apparently, students have not been comfortable with the quality and organization of this requirement in the past. However, the structure and quality of the preliminary exam format has been greatly improved by Dr. Gregory Rorrer (Graduate Advisor). The students had high praise for Dr. Rorrer's efforts in the reorganization and quality of the preliminary exam format and students felt positive about the process as it is currently being directed.

Recommendations

- The structure of coursework in Ph.D. program should be reassessed in view of the possible integration of environmental engineering faculty. Whether or not graduate students with interests in environmental engineering are served by the chemical engineering framework should be evaluated if/when integration is approved.
- The Department should consider starting a seminar series that brings to campus academic, government and industrial speakers. Although this does require resources, in the early years it may be possible to tap scientists, engineers, and practitioners in Oregon for a high proportion of the talks.

- One way to build visibility of the Department and increase the course offerings is by offering short courses taught by visiting faculty. It might be possible, for example, to invite well-known faculty from other universities to visit OSU and give lectures over, say, a week. Students would take these courses for credit.
- The Department needs to expand its offering of 500 and 600 -level graduate courses to provide greater breadth and depth for its students, and reduce dependence on 400/500 courses for graduate education.
- The Department must ensure that appropriate faculty teach courses at the graduate level.

RESOURCES

Graduate student support, adequate and appropriate space and modern equipment are essential components of any graduate program. The first two are of considerable concern. Nationally competitive stipends for Ph.D. students generally range over \$20,000 per year (12 months) plus tuition and benefits. Given that the cost of living in Corvallis is less than in many places where top tier universities are located, the GRA stipend offered by the Department, \$17,388, is competitive. There are, however, two critical issues. First, students receiving GTAs do not receive that same stipend. Second, students are expected to pay (at least) part of their education and insurance costs themselves. These costs have increased dramatically in recent years. When these costs are subtracted from the stipend, the real level of support decreases dramatically and the offers are simply not competitive. Students have been told that these costs cannot be paid by federal grants. Whatever the case, the funding model for GRAs needs to be revised so that competitive offers can be made. All major universities build the fees into the budgets of grants and this model should be followed.

The issue of funding for GTAs needs to be considered from the standpoint of providing stipends that do not penalize students who might move from a GRA to a GTA. The explanations as to why this was not possible seemed confusing and somewhat arbitrary. If this is the case, it is within the purview of the Department to develop a consistent policy that is transparent to the students. If there are issues that cannot be resolved within the Department, then it is recommended that this issue be addressed at the appropriate level and policies be developed that are consistent with those of top tier universities.

The second issue is adequate and appropriate space. The current allocation of research space is about 700 – 800 ft² per faculty. This is reasonable; however, the most recent hires are developing dynamic research programs and there needs to be space to expand. If one researcher, for example, were to develop a funded program requiring 2,000 ft² of space – not an unreasonable assumption, this would reduce the available to under 500 ft² per faculty member, which starts to become marginal. Further, over the last 20 years, the nature of chemical engineering has changed and students increasingly are no longer having their desks in their laboratories due to health and safety concerns. This mandates an additional space requirement, which the Department is struggling to meet and will not be able to meet if the program expands modestly. Given that the

department will need to hire at least 5 more faculty to approach the goal of “top 25” status, there will obviously be increased space issues in the future.

In the view of the Review Committee, the issue of modern laboratory equipment should be addressed through start-up packages, proposals, and donations. Typical start-up packages for new assistant professors, including equipment, student support and summer stipends can easily be as high as \$500,000. The university should be able to provide these funds as well as matching funds for grants and to facilitate contacts with corporations that may lead to substantial equipment donations. This was a significant issue to many members of the committee.

Recommendations

- The funding model for GRAs and GTAs needs to be reviewed and reconsidered so that nationally competitive offers can be made. Most other major universities allow the inclusion of student fees into the budgets of grants.
- Funding for GTAs needs to be considered from the standpoint of providing salaries that do not penalize students who might move from the GRA title to the GTA title.
- Graduate student offices and desk space is very limited and common space is of low quality. These areas should be reviewed carefully and resources invested to bring graduate student offices to reasonable standards.

OTHER ISSUES

The Review Committee views very favorably the merger of Chemical and Environmental Engineering. The two disciplines are complementary. Such mergers are, however, not without issues. These generally result from developing a shared vision that extends from the broad issues down to details of recruitment strategies for graduate students. These issues can be worked out, but the Committee does have two concerns. First, it is absolutely clear that the current Chair is providing excellent and visionary leadership. Indeed, his efforts are remarkable: he is also Chair of Civil Engineering and retired. History seems to indicate that this is a Department in which the position of Chair seems to be particularly critical. The self-study document, as well as some discussions with individuals in the Department indicates that there has been some turmoil in this area in the recent past. Dr. Williamson has been a significant stabilizing force in this area, but as he is officially retired it is unclear how long he will remain in this position. As such, this will be a major issue for the Department. The Review Committee is divided on how to approach this. At least one member of the Committee supports the idea that an external search for a qualified individual will be important. However, others suggest that it may be particularly challenging to identify an appropriate individual for this position in an external search. Thus, a careful and open evaluation of qualified individuals from within the Department might be the best option. A long-term succession plan that perhaps includes a well-defined term of an existing faculty member as Chair might provide the continuity that is required. Regardless of the specific approach, at the

appropriate time it will be very important for the faculty within Chemical Engineering and the Dean of the College to have open and frank discussions on establishing continuity of leadership as they continue to the future.

Secondly, the committee was concerned that the two parts of the planned program, Chemical and Environmental Engineering, will not be co-located. This makes it difficult to reap the benefits of an interdisciplinary Department and also to build the common culture that comes from many informal contacts that occur under casual circumstances. This makes the need for the new building absolutely essential to the future success of the merged Department.

Lastly, one issue that was raised in various ways was the cost of the program relative to others in the College of Engineering. It is generally true that Chemical Engineering Programs cost a bit more to operate than other engineering programs. There are many reasons for this such as Chemical Engineering typically has a smaller number of majors and these departments usually have no service courses. In the case of OSU, the differences in funding are not out of line. Further, there are two offsetting factors. While consideration of the undergraduate program was not within the purview of the Review Committee, the facts that this is the only such program in Oregon, and that (we were told) it attracts many of the best students at OSU, are compelling reasons to keep funding at the current levels. Further, growing the graduate program is another way to justify current or expanded funding levels. At other universities, teaching graduate students is counted at a higher level than undergraduates. However, as University dollar support for departments will likely not increase anytime soon, and as the fee situation probably is maxed out in engineering (we hope), it is likely that additional monies for expansion of the graduate program will need to occur through grants, gifts, and perhaps more nontraditional sources. We stress that increasing external funding per faculty member is a key component of the development of the Department, and that all strides to make opportunities for faculty development in this area should be encouraged.

GRADUATE COUNCIL MEETING

May 19, 2005

3:00pm, MU Board Room

Present: Pehrsson (co-chair), Steel (co-chair), Bond, Ciuffetti, Filtz, Francis, Koenig, Pedersen, Rettig, Rockey, Selker, Strickroth, Tadepalli, Unsworth, Waldschmidt

Absent: Brown

Guests: Sherm Bloomer, Dean – College of Science; P. Shing Ho, Chair – Biochemistry and Biophysics; Robert Smythe, Chair – Statistics; Vicki Ebbeck – Exercise and Sport Science; Ann Schaubert, Coordinator of Interdisciplinary Programs and Director of the MAIS Program

I. Statistics Graduate Program Review Report

Hal Koenig presented an overview of the program review report for the graduate program in Statistics. He shared his concern about the department's faculty work load in advising, teaching, and consulting relative to its budget, and described the department as a proverbial "cash cow." He reported that all but one faculty member had a salary that did not match the 25th percentile of academic statisticians with the same rank and similar years in rank. Koenig described the faculty as collegial and hard-working. He reported a sense of capable leadership and the potential to do much more than the department is doing now, if properly supported by the University.

Robert Smythe, chair of the Statistics Department, thanked the committee for a thoughtful and thorough report. He indicated he was in accord on the large issues identified in the report, but had some reservations with some of the minor points in the document. Regarding the recommendation to add a faculty member with strength in computational statistics, Smythe reported that all of the last four hires have had strong computational skills. He disagreed with the recommendation that new faculty be able to direct doctoral students within two to four years. The phenomenon of post-docs in the field of statistics is non-existent, and he does not want someone right out of their own PhD program to take on doctoral students. Smythe indicated that they will have to think carefully about structuring funding before implementing the recommendation to grow the Survey Research Center. He believes the university should take responsibility for some of the statistical consulting function at OSU and has had discussion with the new Vice President for Research about this approach. In response to the recommendation that an aggressive program of specialized courses is needed, Smythe responded that the department does not have the manpower to do that in the near term. He agrees that improvements to graduate student computer support are needed and highlighted the "growing pains" as the department adjusts to a new computer support group and as the computer support group develops its expertise. A recent purchase of about ½ dozen computers will result in more computing resources available for graduate students. Smythe stated that he would prefer to provide \$20K stipends for graduate teaching assistants, but doing so would limit to 2/3 the amount of teaching assistants required. He noted that the pool of qualified minority students is very small in

quantitative sciences, with almost no progress in the mathematical sciences within the past few years. While they have had some success recruiting Asian-American students, they have difficulty competing with their peers in the recruitment of graduate students of color. Recently, the department has brought consistency between the descriptive text in the Graduate Catalog, their web site and their departmental handbook.

John Selker noted the lack of comprehensive analysis in specialized courses, specifically in the fundamental and critical emerging areas. Hal Koenig indicated that the review team relied on the external reviewers for comments on course work. Selker said that robust and spatial statistics are examples of critical areas that should be developed. Smythe responded that these areas are working their way into the regular curriculum, indicating that STAT 623 and 625 (regression models) have a lot to say about robust statistics. Spatial analysis is an area in which they are considering adding a specialized course, but some content is incorporated in the time series course. In response to Mike Unsworth's question concerning computational statistics expertise, Smythe indicated the department has several needs. While computational statistics are a part of the skills set needed, it is not at the head of their list. Barbara Bond asked if the department had a prioritization list for new hires. Smythe said that three years ago they had a 5-year hiring plan, but the College of Science was not able to deliver. Currently, they have ideas of what they need in the next one or two hires. Sherm Bloomer, Dean of Science, reported that he typically surveys departments in the spring for their faculty hire needs. He reported that Smythe has been masterful at his role as chair and has been successful in recruiting faculty.

Council action on the graduate program review report was deferred until later in the meeting to accommodate guests that were present for other scheduled agenda items. After the second agenda item was concluded, Pehrsson called for discussion about the Statistics report. Bond asked for an analysis of credit for service courses. Koenig indicated that faculty asked themselves how they were going to teach classes more effectively. After conducting a literature search regarding what should be taught, Dan Schafer wrote a statistics book for that purpose. Koenig hopes to get more data this summer.

Steel asked about the Survey Research Center, indicating that he has been going to Washington State University where he gets a better product at a better price. He speculated that the SRC could be a real money maker. Koenig responded by saying that Statistics is in a zero sum game. Steel stated that the SRC needs to be more cost effective and entrepreneurial. Ciuffetti shared that she came away feeling there was no suggestion about how the situation in Statistics may be alleviated. Sally Francis reminded the Graduate Council that a meeting with the Provost will include a plan of action.

After the third agenda item was concluded, the Council returned to a lengthy discussion regarding strategies that should be undertaken to resolve the problem of adequate support for service courses. The Council asked Koenig to strengthen his recommendation in this regarding the increase of faculty FTE in support of delivery of service courses in statistics and statistical consulting. Graduate Council action on this report was deferred pending this revised recommendation.

II. Biochemistry/Biophysics Graduate Program Review Report

Elaine Pedersen provided a brief overview of the program review report for the graduate program in Biochemistry and Biophysics. She characterized the graduate program in Biochemistry and Biophysics as being successful, citing faculty success in scholarship, honors and awards, research grants and contracts and facilities. Pedersen reported that graduate students and alumni are satisfied with the graduate program. She questioned whether biophysics should remain a part of the department/program name. The perception she heard from the external reviewers is that including it may be a recruitment deterrent. She suggested that the department may want to consider surveying students who were admitted but declined and also consider the possibility of hiring a recruitment consultant. She relayed student concern over examinations and suggested that exams may need to be updated.

P. Shing Ho, chair of Biochemistry and Biophysics, responded by thanking the committee for asking the right questions and providing a balanced report. He distributed a written response, which is appended to these minutes. When describing the department's efforts to shift its emphasis to reflect more of the biological sciences rather than physical science, Ho indicated that an institute model may provide a larger umbrella. Dan Rockey asked if Molecular and Cellular Biology could serve this need. Ho indicated that Biochemistry and Biophysics will not sell itself to MCB if the overall program is not going to be as strong as MCB is now. While they are open to using MCB as something they can build from, they will not force themselves into an MCB mode. Ho noted that the current method of centralized recruitment for the life sciences lets students choose the program they want once they visit campus. Barbara Bond asked if they envision a life sciences program spanning across colleges. Ho indicated that OSU's strengths are diluted by the current structure. He contends that combining all life sciences at OSU would result in a program stronger than the University of Washington. John Selker drew an analogy to the Water Resources model, which he indicated has increased the quality of students. Selker questioned the recommendation that the department consider focusing on a few programmatic areas, such as they are already doing with oxidative stress. Pedersen indicated this recommendation was made by one of the external reviewers. Ho said all areas can't be covered. The department must choose the best scientist they can find or point to an area and fill that area. He contends it is difficult to predict what warrants focus, indicating that some areas may be irrelevant within 5 years. When searches are too narrow, the pool is narrow. Sherm Bloomer, Dean of Science, noted that the department's strategy has been successful. He stated that much of the life sciences are dependent on collaboration in larger groups. There is a need to find the right place to group people. There are opportunities to establish other groups in the future, such as with physics. Ho said he has tried to collaborate with the chair of the Physics Department for faculty recruitment, start-up packages and space. But Physics ultimately did not invite Biochemistry and Biophysics to participate.

Dale Pehrsson thanked the guests for all their hard work and preparation in conjunction with the graduate program review. She then asked if there was any discussion on either review report.

Bond reflected that it was hard to see how these two programs (Statistics and Biochemistry/Biophysics) could be in the same college. She noted that Biochemistry and

Biophysics' strategic plan is very thoughtful, but noted a lack of planning in Statistics. Pehrsson indicated it is important to have a plan for recruiting students of color. Ciuffetti stated that their GTA numbers are going down and they are now using undergraduates to assist in courses. Selker reiterated his concerns on the oxidative stress recommendation.

Lynda Ciuffetti made a motion to accept the Biochemistry and Biophysics report as presented. Filtz seconded the motion. The motion passed unanimously.

III. MAIS Follow-up Review Report

Vicki Ebbeck presented an overview of the follow-up review report for the Master of Arts in Interdisciplinary Studies program. She reported that 1/3 of the recommendations have been adopted with the rest in progress. By this time next year, the balance should be completed with one exception. Actions pending include a Category I proposal to establish a Master of Science in Interdisciplinary Studies (MSIS), to create a transition plan relative to the 50% rule, and to establish a few new courses. Ebbeck indicated that the recommendation that was not adopted was to require integration to include three fields of study, each from a different department. The logic was to identify individuals who were truly seeking interdisciplinary degree rather than a surrogate disciplinary program. She believes the reason the current director does not want to implement this recommendation is that a more stringent admission process is being implemented. She cautioned that the Graduate School should provide close oversight to ensure the MAIS is not used as a surrogate program.

Brent Steel stated that the MAIS is implemented differently from department to department and it's hard to think of it as one degree program. Selker stated that the Applied Anthropology review showed half the students chose the MAIS to avoid the foreign language requirement. He asked what metrics will exist to ensure the same thing doesn't occur. Ann Schaubert, Director of the MAIS program, reported that she is conducting pre-advising up front. She advises students to find faculty who are willing to work with them in an interdisciplinary manner. The metrics will be the outcome of what is reflected in their thesis. Steel indicated that the recommendations are good and he agrees that the recommendation for inclusion of 3 departments should be implemented, though he does see some value in using the degree to incubate new programs. Schaubert said that when she looked at the research on interdisciplinary programs, she noted the integration was across three fields of study, not three departments. She said that the process begins with the interest of the student. Francis asked about the safeguards to prevent the MAIS from being used as a surrogate degree. She noted that in her department, students can contact her for advice without going through a graduate program coordinator. She asked if applications will be reviewed only if they go through the program director. Bond asked if there is a program review beyond this review that will compare outcomes to validate on a higher order that the program is doing what we want them to do. She doesn't think our program reviews are examining outcomes. Francis stated that outcomes are included in the Graduate Council Graduate Program Review Guidelines, but most departments are not prepared to address them. Ebbeck suggested that one approach would be to require three departments in the integration and let the program director make exceptions when warranted.

Pehrsson asked for further discussion. Selker said that it is a good report and he is glad to see the emphasis on requiring three departments.

A motion was made and seconded to accept the follow-up review report for the MAIS program. The motion carried unanimously.

IV. Minutes of the May 5, 2005 Graduate Council Meeting

The minutes from the May 5, 2005 meeting were reviewed by Council members. A motion was made and seconded to approve the minutes as submitted. The motion carried unanimously.

V. Other Business

Pehrsson announced that Dan Brown, the graduate student member of the Graduate Council has resigned due to class conflicts.

First Appendix to the Minutes

Graduate Council Program Review of the Department of Statistics Graduate Program College of Science

Summary of Findings and Recommendations

Findings:

When the University administration talks about OSU, the description typically focuses on research output and includes the phrase “land grant, sea grant, space grant, Carnegie Research Intensive Institute.” Obviously, the **Statistics Department plays a vital role** in supporting this output as many grants could not move forward without help from the Statistics Department and most graduate programs would feel the pinch if they had to teach their own statistics classes.

In this context, the review committee found a hard-working department of faculty and graduate students. There was clearly a strong feeling of collegiality, a sense of capable leadership and the potential to do much more than they are doing now, if properly supported by the University. In particular, the committee did find several significant problems that constrain the department:

- The first issue is not novel or unique at OSU, but it bears repeating until the administration acknowledges the problem and begins to work earnestly on crafting a solution – the faculty members in this department are underpaid.
- Based on staffing levels for the past decade, the department is understaffed by at least one, if not two, faculty members in the face of rising SCH, advising and consulting.
- The review panel understood that the Agricultural Experiment Station provides funding for the consulting services provided by the Statistics Department, but faculty from other departments also rely on the Statistics faculty as a consulting resource, generally without compensation.
- The teaching, consulting, graduate supervision and committee workload contribute to a “time crunch” for faculty members which makes it difficult for faculty to
 - have adequate time to write applications for competitive grants
 - spend adequate time on scholarship and publications
 - have time to create specialized courses that introduce graduate students to emerging areas in statistics
- The Survey Research Center seems quite capable, yet appears to be understaffed and thus is unable to take advantage of opportunities for more funded work
- Graduate student stipends are among the lowest when compared to peer institutions.

Recommendations:

- The College needs to fund two additional faculty lines (2.0 FTE) in support of delivery of statistics courses and consulting.
- Additional funding from the College of Science must be provided to increase graduate stipends at least 20%.

- Funding for minority scholarships should be found and used for recruiting.
- The Department must decrease the amount of unpaid consulting and the number of graduate committees they serve on.
- Growing the Survey Research Center should be a priority too, especially if it can be accomplished by bringing another faculty member who can share the teaching load while also managing surveys. The presumption is that most of the financial support for this position would come from “soft” money.
- An aggressive program of specialized courses is needed; we recommend offering at least one additional, special topics course per year. This would produce a large benefit for the department as both students and faculty would be exposed to new and emerging topics in statistics.
- Providing adequate computer support for graduate students is imperative.

PROGRAM REVIEW

Committee and Process

The Statistics Department underwent a Graduate Council Program Review on February 21st, 2005. Members of the Graduate Council Review Committee were:

- Hal Koenig, PhD, Committee Chair (College of Business)
- Tom Adams, PhD, (Department Head, Forest Science)
- Munisamy Gopinath, PhD, (Agricultural & Resource Economics)
- John Boyer, PhD, external reviewer (Department Head, Statistics, Kansas State University)
- Fritz Scheuren, PhD, external reviewer (Vice President for Statistics, National Organization for Research and Computing, and President of the American Statistical Association)

As part of the review process, a self-study report was prepared for the Program Review Committee. The report was delivered to the committee members two weeks prior to the review. The on-campus members of the committee met with Dr. Sally Francis, Dean of the Graduate School to discuss the process and address any questions from the committee. The self-study report, relevant to graduate education, was a compilation of data covering the department mission statement and goals, the profile of graduate applicants, graduate student enrollment and degrees conferred by year, current graduate student funding, department course reaction survey results, sources of funds for department salaries, grants obtained by faculty members, research output by faculty members, coursework required for statistics degrees, comparisons of degree requirements among five comparator universities, course offerings, learning outcomes for the graduate curriculum, information on new initiatives, and Graduate School student surveys. Formal presentations were part of the review, during which the Department chair and various faculty members discussed the work of the department.

During the review, the committee met with the Dean of Science, Sherm Bloomer and faculty and graduate students in the Department of Statistics. A tour of the facilities in Kidder Hall was conducted by Department Chair Robert Smythe.

The Graduate Council Review Committee met with the off-campus committee members following Monday's schedule of presentations and created a short list of points for the three major sections of this report; Graduate Teaching & Advising, Faculty and Research, and Graduate Students. The on-campus members of the review committee each took the lead on writing one of these sections and all members then reviewed and commented on them.

Background of the Department of Statistics

An historic overview of the Department of Statistics is provided in the self-study report. The Statistics Department receives funding from both the College of Science and the College of Agricultural Sciences. The department was established in 1957 with the authorization to grant a Master of Science Degree in statistics. A doctoral program was authorized in 1965 and a Master of Science in operations research was authorized in 1966.

The department does not offer an undergraduate degree in statistics, but cooperates with the Department of Mathematics and the School of Electrical Engineering and Computer Science to offer a Bachelor of Science in Mathematical Sciences. Concentrations in statistics and operations research are available with this B.S. degree. In addition, the Statistics Department offers an undergraduate minor that can be completed with seventeen required hours of statistics classes and ten additional hours in statistics or ten hours from a number of other departments (OSU General Catalog 2004-2005, Catalog 282, April 2004, page 244). A graduate minor in statistics is also offered.

FACILITIES

The Statistics Department has offices in Kidder Hall. Overall the facilities are in reasonable shape, and the department clearly takes pride in its space. One highlight is a small but nicely maintained and apparently up-to-date library, where numerous journals and technical books were found. Additionally, the department has a good quality seminar/conference room. Faculty offices were generally in reasonable condition. Graduate student offices were in similar condition, although they appeared to be a little crowded. It was also pointed out that some graduate students must be housed in other buildings. The graduate student computing laboratory is also very small. Some amount of additional space for the department in Kidder Hall would be desirable.

ADMINISTRATION

Robert Smythe became department chair in 1999. Positive comments were received by the committee about Robert's management style and leadership. As an example, a faculty member

had received an offer from another school and stated that in part, the offer was turned-down because of the environment in the department and support provided by Professor Smythe's leadership.

GRADUATE TEACHING AND ADVISING

Degrees and Student Advising

There are four master's degrees and one doctoral degree offered by the Statistics Department:

- Master of Arts or Master of Science in Operations Research. For these degrees the thesis is optional. Due to a shrinking number of faculty in this area, the intention is to transfer this program to the Department of Industrial and Manufacturing Engineering over the next several years.
- Master of Arts or Master of Science in Statistics. For these two master's degrees the thesis is optional.
- Doctor of Philosophy (PhD) in Statistics. Dissertation is required.

Few students come into the statistics program with an undergraduate degree in statistics. Students with backgrounds in mathematics are common in the graduate student ranks but students with degrees in other areas are not uncommon. Students from areas other than mathematics may spend the summer before their first year or part of their first year taking preparatory courses in mathematics or statistics.

All professorial faculty members serve as Graduate Faculty in the role of major professors or committee members on examining committees. Thirty-nine students are currently assigned a major professor across ten faculty members (see Table 1). Of the faculty listed on page 29 of the self-study, Kollath is not graduate faculty and therefore does not serve as a major professor. For the ten faculty supervising students, the range of graduate students is from 2 to 7, with a median of 4 (see Table 1). At the extremes of the range; three professors advise two graduate students, one professor advises six and another advises seven students.

During the faculty meeting with the Graduate Council Review Committee, a professor with an advising load near the median level made a comment about being "maxed-out on PhD advising." When the review committee spoke with the current graduate students, they mentioned that it was difficult for some students to find a PhD advisor. In addition, faculty members are serving on graduate committees for students from other colleges that have elected to include a minor in statistics in their graduate program. This is consistent with a statement from the self-study (p. 40), "some of our faculty members serve on **20 or more such committees**" (emphasis was added by the review committee).

The review committee is very concerned with the faculty's advising load; at the heart of this issue is the role of minor professor on many graduate committees. At some point, the faculty must limit their service commitment. Ultimately, the department must decide how this is

to happen, but the review committee believes that one possible first step might be to **limit the number of minors** so faculty can have more time for statistics graduate students and also to work on publications and grants.

The review committee would like to see a creative way to service the need for statistics minors without impacting ST faculty so heavily. For example, could faculty from other departments with statistics expertise fill this role or could a course requirement suffice for the minor with no minor professor on the committee, per se?

There is an annual review of students that provides them with written feedback on their performance if they have been employed as a GTA or GRA. There are, however, a small number of students who are not supported and it is not clear how these students are reviewed.

Classes and Teaching

There is a noted lack of specialized courses. During the review committee meeting with the graduate students, they reported that they did not have many options each term and that some classes were only taught every other year. Both the faculty and students would benefit from **having at least one course offered each year on a new or emerging issue, building up to perhaps five new courses over the next four years.**

For the 2004 academic year, thirty-two graduate classes were taught (see Table 2a and 2b). Of these thirty-two, twelve were slash courses. Seven of the twelve slash classes were delivered as part of the Statistics Department's service load to non-majors (e.g., ST411/511, ST412/512, ST421/521). Therefore, of the offerings that statistics students must take for their program of study, only five of twenty-five courses taught in the 2004 academic year were slash courses. For students pursuing an M.S. degree in operations research, the percentage of slash courses is higher – 4 slash course and 9 graduate only courses (these 9 include four 50x classes). It appears that the department is doing a good job of maintaining rigor in its graduate statistics program by offering primarily graduate only classes.

The majority of graduate students come to statistics from elsewhere on campus or from other universities. In the case of an undergraduate student who has a statistics minor, there may be some overlap in the classes, but it appears that enough non-slash classes are offered so the student would not need to take the 5xx version of a 4xx class that was included as part of his/her minor.

The requirements for an MS or PhD in statistics appear reasonable in light of the comparisons presented by the department based on five comparator schools.

Professor Stevens has no assigned teaching FTE. For those assigned FTE in teaching, the lower bound of the range is 0.17 (Pereira) up to 1.0 (Kollath) with a mean and median of 0.44 and 0.38, respectively (see Table 3). In the self-study it was stated that the department's SCH/FTE ratio is among the three highest in the College of Science, but no estimate was provided. Based on the

FTE figures and SCH values from the self-study and the estimate of teaching FTE, the figure for the Statistics department is nearly 3,000 SCH per FTE. For comparison purposes, in a Graduate Council review conducted last year, it was stated that the university average was around 300 SCH per FTE.

Average and median course evaluations for graduate Statistics courses (page 46) are very good. As these averages include responses from students in service courses (e.g., ST511, 512, 521, 522) these numbers can be considered outstanding.

The review committee was impressed with the **commitment to consulting** by the department. This is laudable and the opportunity for consulting experience is viewed as incredibly useful for both statistics masters and PhD students. The College of Agricultural Science provides 0.9 FTE for graduate student funding (p. 13) and over 1 FTE for faculty salaries (p. 29) because of their need for statistical consulting. Unfortunately, faculty members from other colleges on campus call on the faculty for statistics consulting and neither their college nor the faculty member pays for this service. To have more time for classes, research and grant writing, faculty members in the department should simply **say “no” to consultation requests from faculty who are not in the College of Science or Agriculture** unless they are compensated (e.g., written into a grant).

Much of the consulting done by the Statistics Department is with faculty members from departments on campus that primarily use SAS for their research and statistics needs. The review committee found it surprising that SAS was not included in the Learning Outcomes in the self-study report (pages 22-27).

Recognition

Two individuals have been recognized for their teaching/advising/mentoring excellence. One current faculty member and one emeritus faculty are recipients of the Carter Award for Teaching in the College of Science.

One faculty member is the recipient of a Distinguished Achievement Medal from the Environmental Section of the American Statistical Association and several students have received student paper recognition, also from the American Statistical Association.

Student and Alumni Feedback

Responses to the student survey distributed by the Graduate School to those currently enrolled indicated that individuals were generally satisfied. Of those items that focused on graduate teaching and advising, the mean for a few of the items was below 4.0 (1=Strong Disagree, 5=Strongly Agree), but the majority were over 4.0. Lower rated items included initial advising (item #12), receiving research and professional development guidance (#15), gaining teaching experience (#23), and teaching assignments being made equitably (#24). Unfortunately, only 14 students returned a survey – just a third of the graduate student population – making these results hard to interpret by themselves.

The one issue that came up in discussions with the graduate students that reflects the survey results was advising. When students were initially asked about advising, they responded favorably, but when the discussion continued, it appeared that **some information was hard to find** or unavailable. In particular, graduate students mentioned the desirability of having the schedule of classes for at least twelve to fifteen months into the future; this would be especially helpful for classes that are taught every other year. **It would be useful to ask students about the specific information they have had trouble finding and create one central location for this information.** For example, a departmental handbook printed once a year and a website that can be updated on short notice could serve this purpose.

Responses to the exit survey conducted by the Graduate School for students who graduated between AY2002 and AY2004 were quite positive. It was very rare for any of the alumni to respond with a negative response to a question. In fact, if they could start their degree program again, ten of eleven would choose the same major, nine of eleven would choose the same degree and ten of eleven would choose the same major professor.

From a survey done by Statistics of all graduate alumni living in the U.S. for which addresses were available, the responses were also favorable. The few negative responses related to teaching and advising included two of thirty-six alumni who were “somewhat dissatisfied” with teaching, one of thirty-six was “somewhat dissatisfied” with the quality of course content, five of thirty-six were “somewhat dissatisfied” with the availability of classes, six of thirty-six were “somewhat dissatisfied” with the variety of classes, and one of thirty-six were “somewhat dissatisfied” with testing and grading practices. When asked to grade the statistics graduate program, there was one “C+,” one “B-,” two “B”s and all other grades were higher with a mode of an “A” from ten of the thirty-six respondents.

The surveys support comments from the current graduate students who said that they liked the faculty and found them easy to approach and talk to. When we spoke with the faculty members it was very comfortable with each other and supportive of each other’s role. In our experience this outcome is almost certainly not a coincidence. This is a leadership issue as well as a hiring issue – the leadership sets the tone and in hiring decisions you not only find outstanding scholars, but also individuals that fit the culture of the department.

FACULTY AND RESEARCH PROGRAMS

Faculty and Staff Resources

The Statistics Department currently has fourteen faculty, of which ten are in the professorial ranks and four are research associates (2; 1.25 FTE) and assistants (2; 1.30 FTE). The College of Science accounts for much of the professorial FTE (6.16 FTE, 12 month equivalent), while the College of Agriculture and grant funds support the remainder (0.96 and 0.95 FTE, respectively). The Department also has three classified staff (2.25 FTE).

Between 2000 and 2005 the Department lost four professorial faculty (three full professors and one associate professor), mostly to retirements. Additional retirements are expected in the next five years **that may total as many as three of the current faculty**. A search process has been recently completed for two new hires – an assistant professor and an instructor – and the Department hopes to hire another assistant professor to begin in the fall of 2006, subject to approval by the College of Science.

Resource Constraints. The loss of professorial faculty has significantly increased the teaching and advising load among current faculty. **The new professorial hire and instructor will help offset some of the resource problems and the Department Chair is confident about making a strong case for an additional hire to start in the fall of 2006.** However, upcoming sabbaticals and retirements will negatively affect the Department's tradition of offering outstanding academic programs in statistical theory and methods. The load of core and service classes strain current resources leaving little for special topics courses, which limits graduate students' ability to specialize and explore new areas in statistics.

Many students expressed a concern about the limited availability of Ph.D. thesis advisors in the Department and this was noted in the self-study (p. 4). A doctoral student appears to have left the Department last year due to the inability to find an advisor. It appears to the review committee that the Department faces two options to address this problem; **1) they must find ways to cut their advising and/or consulting load, or 2) focus on increasing the number of teaching faculty**. The department may need to pursue **both options** to assure that the quality of graduate education does not suffer.

Related to our concern with the number of faculty is the issue of funding to support consulting services. In our conversation with the Dean, he strongly encouraged the Department to submit proposals to the College for initial funding of positions which can break-even and sustain themselves in 3-5 years (e.g., additional resources for the Survey Research Center). This funding may be a component in crafting a solution to decreasing the consulting load.

Faculty salaries. Unfortunately, this Department is an example of the University-wide problem with salaries. There were several comments made to the review committee regarding both the difficulty in hiring and the failure of the department to keep pace with the normal sort of seniority/cost-of-living increases that are given elsewhere

The review committee was given access to the salaries, without names attached. Faculty salaries were compared with data collected and provided by the American Statistical Association (ASA), the largest organization of statisticians in the United States. In the December 2004 issue of The Amstat News, the official newsletter of the ASA, the association published selected quartiles for salary figures for academic statisticians at research universities across the U.S., with distinctions made by academic rank and years in rank.

With the exception of the department chair, all **salaries were below the first quartile (25th percentile) of academic statisticians** with the same rank and similar years in rank. These values missed the first quartile by amounts ranging from approximately \$1,000 to nearly \$20,000, with the problem worsening as rank increased. In the one case where the salary was not below the first quartile, the department chair's salary was still below the median for faculty with similar experience by almost \$9,000, even if, as we assume, he is being paid an additional stipend for his work as chair.

This situation makes it difficult to hire good new faculty, and even more difficult to compete in the business of retaining the really strong faculty members. Salary compression (i.e., senior people making less or only barely more than their junior colleagues) is a big problem in the department; it has the potential to be divisive and can have an adverse effect on morale.

Faculty Diversity

The current faculty represents a broad range of interests and institutions from which they received their degrees. Many faculty are interested in statistical theory, while others are interested in applications to medical, environmental, agricultural and related sciences. Recent hires are from top-ranked schools that provide good theoretical and applied training in statistics (e.g., Pennsylvania State, Cornell, Carnegie Mellon). There is broad gender diversity – the review committee views it as a “plus” that women represent 40% of the professorial faculty.

Individuals of color represent a relatively small proportion of the professorial faculty. The nature of statistics graduate programs across the country (e.g., increased enrollment of foreign nationals, relatively few graduates from the people of color or Hispanic origin or other groups) presents a significant challenge. The Department Chair has expressed a commitment to ensuring a broad ethnic and gender diversity. However, we would like to see the process to get to this end.

Research Programs

The Statistics Department's research program exhibits a wide array of interests from theory to applications in a wide variety of disciplines; the publication record reflects those interests. Faculty have published in such prestigious journals as *Journal of the American Statistical Association*, *Biometrika* and *Biometrics*. At the same time, excellent applications of statistical methods

by faculty have resulted in publications in top journals of other disciplines like *Journal of Environmental Economics and Management*, *Ecology*, *Plant Physiology*, *Mutation Research* and others. Faculty publications since 2000 total about eighty-five journal articles, which is an average of approximately two publications per faculty member per year. Faculty presentations at meetings and by invitation show a record similar to that of publications (an average of two per faculty member per year).

The Department has received a number of sponsored research grants individually and in cooperation with other departments in the University and other universities. Dr. Stevens, Dr. Lesser and Dr. Pereira, and more recently Dr. Qu and other new faculty, have been very active in sponsored research. The grants average over the past 4 years is about \$800,000 per year not including the contracts received by the Survey Research Center.

Not surprisingly, the high level of productivity has resulted in a number of awards to faculty. Several current members of faculty are Fellows of the American Statistical Association and the Institute for Mathematical Statistics. Other notable accomplishments include a NSF Career award, and teaching and distinguished achievement honors. The placement of MS and Ph.D. graduates in Fortune 500 companies and government agencies reflect the strength of the training provided by the Department's faculty.

Interdisciplinary research's impact on rankings and its consequences. The Department had a top 40 ranking the last time the National Research Council (NRC) carried out rankings. The Department Chair acknowledged that the loss of professorial faculty (who published in theoretical journals) and the increased emphasis on interdisciplinary research will likely place the Department in a lower tier in the next NRC rankings. These factors might have also contributed to fewer placements of graduates in academia. Lack of teaching resources inhibits specialization, but the **Department may want to consider how the ranking change may affect its ability to attract and retain good students and faculty.** Middle ground could be found here if the department decided to specialize in an area like environmental statistics. The department's ability to work with the science faculties involved across campus and the Environmental Health Sciences Center nearby are key ingredients – the department could go make a name here. The drop in NRC rankings in terms of attracting new faculty members and graduate students will hurt, of course, but recognition (if at the highest level), even if only in one specialization can make up for some of that.

Given the high level of teaching, advising and consulting loads of the faculty, **research productivity is quite respectable, on average, but there seems to be an uneven publication presentation record.** A few faculty publish in theory journals which are key to the national visibility of the Department, while a fairly large share of faculty publish in journals of other disciplines. Since 2000, the number of publications has ranged from three to eighteen per faculty. Part of the problem is limited time, but we **encourage all faculty to continue to strive for publications in high-quality journals.**

Grant productivity is very good on average but there seems to be an uneven award record. The grants average over the past four years (\$800,000 per year) is **strong** primarily due to the

EPA STAR grant (\$3 million over five years). However, of late, the younger faculty have increased their grant activity. The college and administration's view is that the Department's grant record is uneven and can be improved with participation from a larger share of faculty. While we recognize that not every faculty member is an entrepreneur, the budgets of state-assisted universities necessitate a change in the traditional roles of a faculty member.

Overall, the review committee is concerned that the number of professorial faculty in the department has shrunk over the last few years (p. 29). Tenure-track positions from 1990 to 2000 appear to have been relatively stable at 11-12. However, in 2005 there are only 8 tenure track positions, with an offer outstanding to an applicant that would start in the fall of 2005. Even if an assistant professor is hired for the fall of 2005 and the chair is successful in lobbying for another hire next year, this still leaves the department approximately two faculty members short of their traditional strength – in the face of rising student credit hours and no apparent cut back in the teaching, advising/graduate committee membership or consulting load (see Figure 1).

GRADUATE STUDENTS

Graduate education in the Department of Statistics is primarily intended to train students for careers as applied statisticians (M.S. level) and for teaching, research and consulting (Ph.D. level). Consistent with the land grant mission of the University, the graduate program in Statistics emphasizes statistical methodology, but with a strong grounding in theory, especially at the Ph.D. level. Through a consulting practicum, all students obtain experience in statistical consulting. This not only provides a significant service to other students across campus, but greatly aids statistics graduate students in developing problem solving, analytical, and communication skills.

In the remainder of this section, we provide observations on several aspects of graduate education in the Department: 1) student recruitment; 2) quality and retention of students; 3) student support; 4) employment of graduates; and 5) current student and alumni satisfaction with the program. These observations are based on the self-study materials supplied by the Department, including the results of three surveys (current students, Graduate School Exit Survey, alumni survey), and interviews conducted in February during our visit to the Department.

Student Recruitment – In the past five years the number of applicants for graduate study in Statistics has ranged from 59-94 (mean 87), the number admitted has ranged from 43-78 (mean 59) and the number enrolled has ranged from 11-16 (mean 14). Typically, the great majority of students enrolled each year are M.S. students (typically 12); only a handful are Ph.D. students (around 2). The Department has no stated admission criteria except good grades in calculus, linear algebra and introduction to mathematical statistics. Admitted applicants, however, come from a variety of academic backgrounds, some strong in math, and others with less math but with more training in various scientific applications. It is felt that the Department benefits from this mix of two kinds of students.

The self-study does not provide a quantitative assessment of trends in academic qualifications of applicants in the past five years (only averages over this entire period). Concern about the quality of applicants, however, led to faculty visitations at four Northwest Colleges and Universities

in 2004 to promote the program, and to subsidizing the visits of promising applicants to campus in order to meet faculty and students in the Department. The intent is to continue these efforts in the future, as well as improve the Department's website to make it more informative and attractive. We certainly applaud and support these efforts to enhance recruitment of the best students.

In terms of diversity, about one-third of the new students enrolled each year are international students, and the gender mix is about equally split between males and females. **While the Department has attempted to recruit underrepresented groups (e.g., Blacks, Native Americans, Hispanics), this goal was recognized as difficult and perhaps unattainable without a major new effort.**

Quality and Retention of Students - The total number of students has varied little over the past five years (thirty-five to forty), with a current student body of forty. The fraction of graduate students who are in the Ph.D. track, as opposed to the M.S track, has risen steadily from 2000, when Ph.D. students accounted for about 15% of the graduate student population, to the present time where they account for about 40%. Since the proportion of newly admitted graduate students who are brought directly in on the Ph.D. track has not varied significantly over the years, the increase in the proportion of students studying in the department who are in the Ph.D. program must be a function of the longer period of time to graduate (median five years (Ph.D.) vs. one and a half years (M.S.)) and some students progressing directly from the M.S. into the Ph.D. program. Currently nine of the fourteen Ph.D. candidates are international students.

Retention of students in the program has been excellent. It appears that only a couple of M.S. students failed to complete the M.S. program in the past five years, and no Ph.D. student that has advanced to candidacy (after passing the comprehensive exams) has withdrawn since 1999 (although 2 Ph.D. students have moved away to take jobs, with the intention of completing their dissertations off-campus). This high rate of retention is no doubt a reflection of the high quality of students enrolled in the program (average undergraduate GPA 3.7). Other evidence of student excellence is the high praise collectively given to students by faculty when we met with them, and the array of highly competitive University and professional society awards received by students in recent years.

Student Support - Twenty-six of the forty current students receive some assistantship. Most are supported at 0.45 FTE with either a nine month Graduate Teaching Assistantship (GTA) or a twelve month Graduate Research Assistantship (GRA). Both have the same monthly stipend of \$1277, with a tuition waiver and insurance coverage. **Although this level of support is roughly on par with graduate students in other colleges at OSU, it is the lowest of nine comparator institutions in the self-study report.** Surely, this comparatively low level of support hinders the Department's ability to recruit the very best students into its program. The Department attempts to compensate by providing additional fellowship awards to the most promising students. The self-study mentioned that the goal is to increase this effort in the future. It is unclear why there is only one rate for both M.S. and Ph.D. students. Other units on campus provide larger stipends to Ph.D. students.

Employment of Graduates - It appears that graduates in Statistics have been quite successful in finding jobs in their chosen field. Forty-nine students graduated with an M.S. in the past 5 years, of which employment information is available for 26. Nearly all of these individuals were placed in statistics-related positions. Employment information is available for 11 of the 12 Ph.D. students who graduated in this same period; all of these alumni are involved in research positions and several have teaching responsibilities as well. **We would have liked the M.S. data to be more complete and are surprised that more is not known, especially since continuing contact by the Department with its former students can be an important source of academic enrichment for both faculty and student currently enrolled in the program.**

Satisfaction with the Program - Interviews with current students, and surveys of current and exiting students, and alumni, were consistent in their praise of many aspects of the graduate program. Students and alumni generally expressed a great deal of satisfaction with the quality of teaching and advising, rigor of the program, access and interactions with professors, opportunity for consulting (through the practicum), opportunity for teaching experience (and fairness of assignments), administration of program examinations, the departmental seminar, and the consulting practicum. It was also evident in the **interviews with faculty and students that there is a great deal of respect between these groups and good rapport. There was a great deal of candor and humor in our sessions and every evidence that that the praise was genuine.**

Nonetheless, dissatisfaction was expressed by students in four areas: 1) GTA/GRA stipends, 2) office facilities, 3) computing facilities, and 4) grading of assignments by other students. The need for improved stipends has already been discussed above. Complaints about office space is universal among graduate students (and faculty for that matter) across campus, but the Department Chair should follow-up with the students on this issue to make sure there is not a significant concern that could be rectified in some way.

The self-study addresses the concern about computing facilities, but suggested the problem was mostly the result of recent consolidation of computing administration in the College, which is working itself out. **Our discussion with students indicated that the problem lies more with antiquated hardware (i.e., PCs and printers), which is compounded by reduced computing support resulting from the consolidation.** It is ironic that a program wishing to further emphasize analysis of large, complex data sets does not have the most advanced computing hardware available. We suggest the Department look into leasing of PCs and peripherals. This is a means to having the latest hardware, at a fairly **economical cost.**

The last issue concerns discomfort among students in both evaluating and being evaluated by close peers. Apparently, GTAs in some graduate courses end up grading assignments of other statistics graduate students. The concern seems mostly to be where one M.S. student is grading another, and not when Ph.D. students grade the work of M.S. students. **This concern seems to be a relatively easy to fix and we recommend action be taken.**

One last point; problems, such as the weaknesses in departmental computing, were openly and constructively discussed. In fact, we found morale very high, with a real spirit of community evident.

APPENDICES

Second Appendix to the Minutes

BIOCHEMISTRY AND BIOPHYSICS GRADUATE COUNCIL PROGRAM REVIEW 2005

Summary of Findings and Recommendations

The Graduate Program in the Department of Biochemistry and Biophysics is a highly successful academic research unit. Several members of its faculty have been recognized at various levels for their research accomplishments at many levels. The Department has developed a solid graduate program offering both M.S. and Ph.D. degrees. The faculty and staff and the programs make a substantial contribution to research and teaching at OSU; the prospect for future contribution is great.

The Department has actively participated in several interdepartmental programs, including the Linus Pauling Institute, the Environmental Health Science Center, the Center for Gene Research and Biotechnology, and the Molecular and Cellular Biology Program. The interdisciplinary collaborations expand the strengths and research breadth of the Department, providing intellectual stimulation for faculty and students alike as well as providing additional recruitment and research funding opportunities.

Alumni satisfaction is generally high. Graduating students appear to receive good guidance and help in finding suitable post-doctoral positions as well as opportunities in industry.

The following recommendations are offered from the perspective of ensuring that the Department's Graduate Program maintains its present high quality level and at gains in strength.

Recommendations:

Graduate Students and Graduate Curriculum

It is recommended that the Department make use of its current graduate students in recruitment activities and other department activities. For example, they could advise and assist more in recruiting future graduate students by helping with items such as web page design and by undertaking speaking engagements. They could take more of a lead in organizing seminar series and in developing a journal club.

It is recommended that the Department should study the reasons for the drop in the number of women students and take appropriate remedial actions. Also strong actions must be taken to actively encourage and recruit Hispanics and African Americans. The undergraduate population at OSU is an obvious recruitment pool, but the faculty might also network with other undergraduate institutions and encourage their students of all races and genders to apply to OSU.

It is recommended that a formal or informal survey of students who decline admittance offers needs to be carried out. These applicants could be asked about specific reasons for their decision not to come to OSU including assistantship stipends, required coursework, and the match between their research interests and faculty in the department. ***It is also recommended*** that the Department needs to seek further advice through a recruitment consultant to identify best methods for determining what works and what doesn't work well in recruitment.

It is recommended that the Department consider whether recruiting from their undergraduates might be an option that should be more actively pursued.

It is recommended that the faculty develop a variety of opportunities at which students may interact across the Department with fellow students and department faculty.

It is recommended that the Department begin to systematically collect data that would enable the Department to explore whether the use of the word "biophysics" in the Department title promotes or deters the recruitment of graduate students.

It is recommended that students be made aware of the dollar amount of student fees when they are sent information about their admittance into the program and the offer of a GTA position.

Several recommendations relate to the need for the department to consider what outcomes it desires of its graduate programs. After determining what outcomes are desired and needed ***it is recommended*** that the Department consider revamping its core requirements, that the Department review the preliminary doctoral examinations, and that the department consider offering technical writing, bioanalytical methods, and grantsmanship courses.

Graduate Student and Faculty Interaction

It is recommended that methods for improving intra-departmental communications is developed. As a corollary to ***this it is recommended*** that the Department review its policies regarding graduate students' lab experiences and that these policies are clear to both faculty and graduate students.

Faculty and Faculty Performance

If it is the desire of the Department and the College of Science that the Department of Biochemistry and Biophysics retain and improve its national standing related to grant funding and research activities ***it is recommended*** that additional faculty positions (1 or more) be enabled for the Department.

It is recommended that the Biochemistry and Biophysics Department take advantage of *every* possible opportunity for new hires, be it in their own department, the collaborative interdisciplinary programs in which they participate, or in any other department within the College of Science.

It is recommended that in addition to targeted expertise, the Department should also consider focusing on a few programmatic areas, such as they are already doing with oxidative stress.

Quality of Outcomes

It is recommended that the Department find other metrics (funding per faculty, papers per faculty, research impact, quality of undergraduate and graduate students, and so forth) to use as a more frequent measure of the department's national stature. This decision needs to be consistent with the means by which the Department is evaluated by the Dean and the University.

Program Review

Committee Process

On February 23, 2005, a Graduate Council review team visited the Department of Biochemistry and Biophysics to conduct a full program review of the Graduate Program in Biochemistry and Biophysics. Team members were:

- Elaine Pedersen, College of Health and Human Sciences (Design and Human Environment), Chair
- Prasad Tadepalli, School of Electrical Engineering and Computer Science
- Mike Unsworth, College of Oceanic and Atmospheric Sciences (Atmospheric Sciences)
- Fran Jurnak, Department of Physiology and Biophysics, University of California - Irvine
- Gary Schroth, Solexa Inc., Hayward, CA

Several of the internal (OSU) members of the review team participated in a pre-review meeting held February 15, 2005. The Biochemistry and Biophysics Graduate/ Undergraduate self-study report was provided to the review committee. The site visit provided the review committee an opportunity to meet with P. Shing Ho, Department Chair; Jack Higginbotham, Research Office; Sherm Bloomer, Dean, College of Science; Graduate faculty; and with fourteen graduate students. Reports from Fran Jurnak and Gary Schroth were forwarded to the review committee chair following the site visit and then incorporated into the report. The full report was shared with the committee. Individual committee members took responsibility for writing particular sections of the program review. All committee members have read the final version of the review for factual accuracy.

Overview

The Biochemistry and Biophysics Department at Oregon State University is one of the most successful academic research units on campus and its faculty members have been recognized for research accomplishments at many levels. The Department has a solid graduate program. Both M.S. and Ph.D. degrees are offered; most graduate students are pursuing doctoral degrees. Current graduate students were attracted to the Department because of its national research reputation and the reputation of specific faculty, the research facilities, and the availability of biophysics together with biochemistry.

All graduate students take three core Biochemistry courses, three core Biophysics courses, and a Graduate Seminar. Positive responses related to overall satisfaction with the program were received from a survey of alumni.

The relocation of the Linus Pauling Institute (LPI) to OSU in 1997 has positively benefited the Department. Three members of LPI are also affiliated with the Department: Dr. Balz Frei, Director of the Center and Professor of Biochemistry and biophysics, Tory Hagen, LPI Faculty and Associate Professor of Biochemistry and Biophysics, and Joseph Beckman, Ava Helen Pauling Chair in LPI and Professor of Biochemistry and Biophysics (he recently assumed the Directorship of the Environmental Health Sciences Center). All three are integral to the Department and contribute to the classroom teaching and research training missions of the Department.

Description of the Program

Students

The Department mainly focuses on Ph.D. degrees. There is a notable under-representation by women. There are currently 23 graduate students in the graduate program; 21 seeking the Ph.D.; and 2 seeking the M.S. Seventeen of the 21 Ph.D. students are male, 4 female. Both the M.S. students are male. Fifteen of the students are white and 8 are Asian; 16 are domestic and 7 international. The overall number of graduate students in the program has been declining in the past 10 years to half of what it was in 1995. This is particularly true for doctoral students. Some of the decline may be due to difficulties international applicants have faced since 9/11. However, it appears that much of the decline in student population can be attributed to the decline of female students. The current percentage of women graduate students in the Department is significantly lower than that in the University as a whole. This is unfortunate and somewhat unusual in the biological sciences. The relatively small number of female faculty may have been a reason for the low female enrollment in recent years. Two women faculty were hired recently, and it is to be hoped that this will help to reverse the trend.

Some questions by external members of the Review Committee were directed toward recruitment issues, trying to identify features that attract the students to the Department. The majority of the current students appeared to be independent thinkers and self-motivated. When they came to OSU on their recruitment visits they were impressed with the quality of the faculty, the broad opportunities for research including strong research facilities, the availability of biophysics with biochemistry, and the friendly environment. This information may be useful in developing recruitment strategies. The graduate students expressed interest in becoming more involved with the Department. They were enthusiastic, thoughtful, and made several suggestions about how they could contribute more to the Department. ***It is recommended that*** the Department make use of its current graduate students in recruitment and other departmental activities. For example, they could advise and assist more in recruiting future graduate students by helping with items such as web page design and by undertaking speaking engagements. They could take more of a lead in organizing seminar series and in developing a journal club.

It is recommended that the Department should study the reasons for the drop in the number of women students and take appropriate remedial actions. Also strong actions must be taken to actively encourage and recruit Hispanics and African Americans. The undergraduate population at OSU is an obvious recruitment pool, but the faculty might also network with other undergraduate institutions and encourage their students of all races and genders to apply to OSU.

It would be helpful if the Department were to determine why students apply to their program, why students decline admittance offers and from which colleges the students originate. The current graduate students are helpful, in so far as they are able to identify features which convinced them to enter the program. ***It is recommended*** that a formal or informal survey of students who decline admittance offers be carried out. These applicants could be asked about specific reasons for their decision not to come to OSU including assistantship stipends, required coursework, and the match between their research interests and faculty in the department. ***It is***

also recommended that the Department needs to seek further advice through a recruitment consultant to identify the best methods for determining what works and what doesn't work well in recruitment. For example, the Department has set up a program to support faculty presentations on other campuses, but have data been collected to determine if this recruitment technique is cost-effective? One idea, which was mentioned during the Graduate Program Review, was to have the Department participate in an umbrella, multidisciplinary graduate program. This type of approach often saves money and time, in terms of faculty participation, but usually condemns weaker departments to even fewer graduate students. Before the Department embarks on this approach as a means to increase graduate student quantity and quality, the Department should actively seek out the experiences of faculty at other universities that have embraced this approach. An alternative is to enhance the attractiveness of the Master's Program and actively recruit promising Master's students into the Ph.D. program.

In addition to expressing interest in more involvement with Department recruiting and formal department activities, there was interest expressed by the students to be more connected to the other graduate students in the program. They suggested pizza lunches and informal social gatherings. *It is recommended* that the faculty develop a variety of opportunities at which students may interact across the Department with fellow students and department faculty.

Selectivity of Students

The Department's enrolled domestic students' average GPA increased since 2000. The 2000 average of 3.36 is slightly lower than the average GPAs of enrolled domestic students between 1994 and 1999. The Department expressed concern that the GPA of their enrolled domestic students is less than the GPA of the domestic applicants. This has been a relatively recent trend and the difference may not be significant. Since these numbers usually have significant variance being based on small samples, we should not read too much into them. Average verbal and quantitative GRE's for incoming students are higher than the average for all of the life-sciences students taking the exam and are comparable to those of students from the physical sciences. Thus students applying to, accepted to, and enrolled in the BB graduate program are in the top half of target students who have taken the GRE exams.

The Department considers several criteria including the GPAs and GRE scores of students in making admissions decisions. The total number of applicants to the Ph.D. program is around 180. The number of domestic students has dropped from about 30 in the early 1990s to about 15-20 per year currently. The total number of offers made is around 13 per year, while about 6 students enroll per year. About 50% of the domestic applicants were accepted into the program while only 2.5% of the foreign applicants were. Thirty-eight percent of the domestic students and 74% of the foreign students who received offers enrolled in the program.

The Department has changed the strategy of recruiting students from traditional means such as advertising in the Peterson guide to improving the web site. More recently the faculty are being encouraged and supported to go to conferences and other schools to advertise their graduate program. The students who are offered support are called for a campus visit and get a chance to visit with the faculty and students. Many of the students we talked to were impressed with the faculty and their research when they first visited here and were pleasantly surprised by the

Department's strengths. While many students came to OSU due to personal and geographical reasons, some were attracted by the reputation and research of particular faculty members. Many students are attracted by the financial support; the Linus Pauling Institute and other multidisciplinary opportunities; and the Department's laboratories and other facilities. While some are particularly attracted by the biophysics and biochemistry combination, we were told by the students that some students are turned off by the biophysics component and choose not to come here.

It was noted in the self study/by the Department faculty that the Department's undergraduates often have higher cumulative GPA's than the Department's new graduate students. ***It is recommended*** that the Department consider whether recruiting from their undergraduates might be an option that should be more actively pursued.

One potential deterrent from recruiting better graduate students and more women may be the name of the Department. The word "biophysics" connotes extra rigor in the curriculum. Whereas the history of the Department is rich in strong biophysical research and this title may have been an advantage in the past, biophysics only represents about 30% of the current make-up of the Department and is somewhat misleading. Thus, the other 70% of the Department may be at a disadvantage when trying to recruit students for molecular biology or for mammalian research. Whether or not the title of the Department is an advantage or a disadvantage can only be decided by systematic data collection and marketing strategies, which the Department should establish. ***It is recommended*** that the Department begin to systematically collect data that would enable the Department to explore whether the use of the word "biophysics" in the Department title promotes or deters the recruitment of graduate students.

Financial Support of Students

All the first year students are offered GTAs at the rate of \$19,000 for 12 months. During 2004-2005, the students paid fees of several thousand dollars per year. Some students were surprised by this additional fee and health care costs and were not prepared for it. In the future, there should be a clearer communication from the Department and the university about the additional fees, before the students make their decisions. The Department will be raising the GTAs to \$20,500 starting 2005-06, which would alleviate some of the problem. It will be much better if they eliminate the additional fees instead or bring the stipend closer to the same level as the other schools. From the second year on, the funding depends on the availability of research grants with individual faculty members and good academic standing of the student. ***It is recommended*** that students be made aware of the dollar amount of student fees when they are sent information about their admittance into the program and the offer of a GTA position.

Curriculum

The graduate school requires a total 115 credits for a Ph.D. degree. The Department requires a total of 36 real (non-blanket numbered) course credits, including a 3-course core sequence in Biophysics and a 3-course core sequence in Biochemistry. The rest of the courses can be special topics courses of which there are many or other courses in related departments.

A typical graduate student program consists of taking core courses, finding a major professor, and forming the program committee during the first year. All first year students must take the first year graduate seminar series, which gives an opportunity for them to learn to present their work. The Department also sponsors seminars every week, a majority of which are by faculty members from other institutions. There are other seminars offered by various departments and programs that the students are encouraged to attend.

Every first year graduate student is expected to do at 3 lab rotations, one per term. During the first quarter of each year, all of the faculty members of the Department make 30-minute presentations to the students to introduce them to their research, which can be the basis of choosing rotations. The research rotations expose the students to the variety of opportunities available in the Department. Secondly, they help the student “try out” a lab and the professor to “try out” a student. At the end of each rotation, the faculty member is expected to complete an evaluation and allow the student to add his or her own comments. These are used to evaluate the student at the end of the year. In addition, the student will be presenting a summary of his research to all faculty in a 5 minutes presentation at the end of each rotation. From the students we talked to, it appears that most students find a major professor to work in within 3 rotations, although there are occasionally some who cannot. The end-of-the year evaluation gives a chance to determine the reasons and terminate weak students. The students we talked to were generally happy and satisfied with the system.

In third year of their Ph.D. the students are required to present a seminar on their research to all faculty members. This usually occurs before the prelims and may help students progress towards their prelims in a timely manner. The prelim includes a proposal preparation, presenting it to the committee and answering questions on the proposal and course preparation.

Whether the faculty agrees philosophically or not, the trend in science graduate programs is to reduce the core course requirements to a maximum of three, to have some type of requirement for advancement to candidacy by the end of the first year, and to allow the students to focus on research projects from their second year onward. Many programs do continue to require and provide student participation in seminars and/or journal clubs.

It is recommended that the faculty re-evaluate whether they are doing the students a service or disservice by imposing too many extra requirements, including six core courses, on their graduate students. Although, there was no opportunity to query students who declined admission to the Biochemistry and Biophysics Graduate Program, one can only guess that the heavy requirements, in comparison to other comparable graduate programs, may be a deterrent. During the re-evaluation ***it is recommended*** that the Department consider revamping its core requirements.

Scholarly Community

The Biophysics and Biochemistry Department has 15 tenure track faculty including 8 full professors, 4 associate professors, and 3 assistant professors. In addition there are 17 affiliate faculty that reach across biological and chemical departments and institutes at OSU. This department is small in relationship to other departments of biochemistry across the country.

Recent hires of two female faculty have made the demographics similar to those of other biochemistry departments. Salary ranges for full and associate professors are lower than the national averages, but rates for assistant professors are close to the average. Thus the Department can be reasonably competitive in recruiting for junior faculty positions.

The Department is very conscious of its multi-disciplinary role and participates in multi-departmental programs in Biology, Genetics, Toxicology, and Molecular and Cell Biology. Several of the faculty members actively contribute to Linus Pauling Institute (LPI), Environmental Health Sciences Center (EHSC), and Center for Gene Research and Biotechnology (CGRB).

The Department's strengths include X-ray crystallography, kinetic, optical, and NMR spectroscopy to study the structure, folding, and modification of proteins and nucleic acids. Joining hands with LPI, the Department has established strengths in the areas of oxidative stress and aging. In recruitments over the last six years, the Department has maintained its balance in the biochemistry and biophysics research areas but has significantly increased the number of faculty in the mammalian molecular and cell biology by adding three assistant professors. There may be changes in the coming years as the Department is planning to align itself with the provost's initiative to recruit people in bioinformatics and systems biology and join the capital initiative to recruit top faculty.

Collaborating with several other departments on the campus and the EHSC, the Department is developing a fully functional transgenic mouse facility for doing research into mammalian development and human disease. In the past, several faculty have played key roles in establishing multidisciplinary programs and centers on campus, including the Center for Gene Research and Biotechnology (CGRB) and the Molecular and Cellular Biology Program.

The average teaching responsibility for faculty is 2.6 courses for the academic year, with one course on average being a graduate-level special topics class. This is equivalent to 75 students per FTE per term. New faculty in the Department are given reduced teaching loads of in-class teaching, which gradually increases to the normal level in 3 years.

Although this teaching load is relatively low compared to other departments in the college, it is very high compared to other departments of biochemistry, especially those in medical schools. This inevitably impacts on the time available for faculty to pursue research, and supervise graduate students. Although several faculty could probably do so, it is not department policy to allow faculty members to entirely buy-off from their teaching responsibilities.

Facilities

The faculty's success in obtaining grants has translated into the acquisition of a variety of instruments and the development of the facilities to further the faculty's research capabilities. This includes a 600 MHz NMR/Microcoil, an X-ray Facility shared with Chemistry, a Confocal Microscope, Rapid Kinetics, FTIR, Plasmon Resonance Spectroscopy, BioCAD perfusion chromatography, Yeast Knock-out and Antibody Display Library, a student computer lab, and a stereographics classroom. The total funding awarded for equipment and facilities in the past 10 years is \$3,193,000.

The Department of Biochemistry and Biophysics is located in the Agriculture and Life Sciences Building. Much of the space for research laboratories, offices, shared research facilities, and the Department office is on the 2nd floor. There is additional space on the second floor allocated to the EHSC and CGRB for shared instrument facilities (including the biological X-ray diffraction and Confocal Microscopy facilities). The laboratories and offices of Drs. Frei and Hagen are located in the space assigned to the Linus Pauling Institute on the fifth floor of Weniger Hall. There is storage space and plant growth chambers in the basement of ALS and storage space on the 6th floor of Weniger Hall. The utilization of space in the basement is being renegotiated in order to develop a transgenic mouse facility to serve the life sciences unit, colleges, and centers on campus. Additional facilities include preparation and cold-rooms; Department classroom; a reading room holding current journals and periodicals, textbooks, assigned class material, job resources, and selected publications from various members of the faculty; conference room, graduate student/staff lounge.

Current attention to facilities is to improve the animal facilities particularly in the area of developing a transgenic animal facility to study model organisms and their development. This need has been recognized across campus via support from the University, the College of Science, the Linus Pauling Institute, and the Environmental health Sciences Center.

Administration

The Department is located in the College of Science. The Department chose to be located within the college because of the mission of the College emphasizing teaching, training and basic research. Expectations for research and instruction are well defined. Additionally, a department that is located within one college has a lower administrative overhead compared with departments located within two or more colleges.

The Department Chair is currently appointed on a 5 year rotating basis by the Dean of the College with recommendations from the Department faculty. The current Chair, P. Shing Ho, will be reviewed during Spring 2005 and is expected to rotate out of the position at the end of the 2006-2007 academic year. The Chair's responsibilities include budgetary oversight, enforcement of department policies, regular review of Academic Faculty, assignment of teaching and service responsibilities, and oversight of the department staff.

The Department has four standing committees. These are: Executive Committee, Curriculum Committee, Graduate Committee, and Promotion and Tenure Committee. The Graduate Committee is composed of four Faculty members appointed by the Chair for staggered two-year terms. The Chair of the Graduate Committee is appointed by the Chair of the Department. The Graduate Committee evaluates applications and makes recommendations for admission to our graduate programs, oversees graduate student recruitment and administers the Departmental Exams.

There is a Graduate advisor appointed by the Chair for a three year term. The Graduate Advisor assists with orientation and advising of entering graduate students, monitors the academic progress of graduate students and oversees all aspects of the graduate program.

Support Staff

The support staff consists of an Office and Research Coordinator (at 0.5 FTE), one full time Office Specialist, and a full time Accounting Technician.

Performance of the Program

The Department has actively participated in several interdepartmental programs, including the Linus Pauling Institute, the Environmental Health Science Center, the Center for Gene Research and Biotechnology, and the Molecular and Cellular Biology Program. The interdisciplinary collaborations expand the strengths and research breadth of the Department, providing intellectual stimulation for faculty and students alike as well as providing additional recruitment and research funding opportunities.

Graduate Students and Graduate Program

The number of Ph.D. degrees conferred from 1995-2004 has held steady at 3.3 per year, peaking at 4 during the period 1999-2002, a Ph.D taking somewhere from 4 to 8 years, with an average of 5.4 years, where the norm for graduate programs in the country is between 5 to 5.5 years.

The Department currently has 23 graduate students (i.e., just less than two per active faculty member). It would be good to see this number expand in such a successful research department. About three to four graduate degrees are awarded each year, corresponding to the mean time to graduation of between five and six years. The alumni survey indicates that most students thought that this was about the length of time expected. Graduate students seemed satisfied with the quality of teaching that they received, but undergraduates raised some points of concern that should be addressed in relation to all types of teaching undertaken by the faculty. Alumni expressed a good deal of satisfaction at the quality and relevance of the training they had received in the Department.

Eleven students interacted with the graduate program review committee. While some students felt that communications with faculty were very good, the majority thought that there could be improvements – this disparity probably reflected the working relationships with major professors. ***We recommend*** that one or more regular methods for improving intra-departmental communications is developed.

One concern expressed by the graduate students was the design of the doctoral preliminary examinations. They felt the process evaluated a student's ability to take a test more than it evaluated the subject matter content of the exam. Prior to their oral Preliminary Exam, the graduate students are required to pass a series of departmental written exams in their second and third years. This series of exams is composed of a set of two questions given each term. Students must pass six questions out of a maximum of 12 questions. The students stated that the topic of the questions is made available a few days prior to the exam. Students felt that the exams did not help them learn anything new or synthesize currently held knowledge. Although this type of examination system is intended to provide an in-depth education in a broad range of topics germane to biochemistry and biophysics, there is no indication that the process achieves this well-intentioned goal.

It is recommended that the Department review their preliminary doctoral examinations. A first step to take is to discuss what outcomes the Department wishes to achieve with the preliminary examinations. For example, one outcome might be the goal to encourage students to think creatively rather than the memorization of facts. They may wish to contact other programs to learn about the various written preliminary examination designs that are currently being used on the O.S.U. campus. Depending upon what outcomes the Department wishes its doctoral candidates to have, the Department may want to consider changing the format.

The students were divided about whether the balance of coursework between biochemistry and biophysics was reasonable, though a number expressed the view that it was the availability of both that had been an attraction. The scheme by which students rotate through different laboratories was popular and seems to work well without being too formalized. Students liked the opportunity of working one-on-one with faculty. Students reported that they had good opportunities to attend professional meetings, and they regarded this as very important for their career development.

Students did recommend a class on grantsmanship and a technical writing course. These topics might be included as part of the preliminary examination process as is done by several OSU departments. ***One student recommended*** a three term bio-analytical methods course. They also suggested that prospective students be informed of student fees when they were offered their assistantships as these costs were unexpected.

Results from a survey of graduate PhD alumni indicated that they felt 'satisfied' to 'very satisfied' with their overall experience in the Department. There was particular satisfaction with the advising from major professors and general satisfaction with the overall graduate program. Fifteen of the sixteen respondents stated they would select the same major, degree, and O.S.U. again if they were starting their degree program. When asked about how prepared they were as a result of their training at OSU nine of the 16 students surveyed felt very prepared as a result of their training, and five were somewhat prepared. Several of the respondents made additional positive comments about their graduate degree program: "very satisfied with the level of training and mentorship that I received," "The BB program at OSU has turned out to be one of the best times of my life," and "Since leaving it has become clear to me that understanding of Biophysics is critical to Biochemistry."

The lowest levels of satisfaction were awarded for the advising from the Department (as opposed to generally high satisfaction with the major professor), the diversity and availability of graduate classes, level of financial support, and relationship with the graduate committee.

While the Department does not actively recruit nor guarantee financial support for M.S. students they received 5 responses from alumni who had earned their M.S. from the Department from 1993 to 1998. In general the graduates were satisfied with their education experience in the Department. They were particularly satisfied with the overall quality of graduate education, the diversity and availability of graduate courses, and the resources for student research. There was

less satisfaction with advising/guidance and major professor mentoring. Four of the five felt very prepared for a career or move to more advanced degree.

One master's degree alum, however, seems to have had an unfortunate experience. He wrote, "I was restricted in my learning by a professor whose lab did the analytical testing for my lab's compounds. I wanted the lab experience; he wanted to be included in the on papers and refused to teach the techniques to anyone in our lab." This was a comment from only one individual; however, it may suggest a possible area for improvement. ***It is recommended*** that the Department review its policies regarding similar situations to ensure that policy is in place that makes the expectations for the professors and students very clear.

Faculty

In general, the faculty compare favorably with similar departments in other established research universities. The national and international stature of several senior members is outstanding. In terms of objective measures of faculty quality, the faculty in the Department of Biochemistry and Biophysics rank 36 out of 194 departments in the 1995 National Research Council ranking of graduate programs, comparable in rank to the University of Minnesota and the University of Southern California. A more recent survey, reflecting the retirements as well as the research programs of the newer faculty is not available. However, other indications of quality include the amount of external research support and the publication activity. The extramural research support is outstanding for a moderate size department in biological sciences, given the average \$358,000 in support per faculty per year in the most recent five-year period. The publication activity is also good, given the annual average of 2.4 peer-reviewed research publications per faculty in the 2000-2004 period. As faculty retirements and an increased number of service teaching classes have taken their toll, research income per faculty member has fallen. The average annual publications drops to 1.3, if one excludes those retired or LPI faculty without teaching responsibilities, suggesting a significant impact of teaching duties upon research activities.

Overall, the faculty is highly successful in the research enterprise and manages this with a teaching load that is considerably larger than in other biochemistry departments. The Department teaches a large number of service courses at the undergraduate and graduate levels. This imposes a large load on the faculty, and it is not clear that they receive sufficient support in terms of GTAs from the college and from major 'customer' departments. It is difficult to see that the Department's three goals of improving its national standing as a research program, maintaining the quality of undergraduate student programs, and expanding the graduate program can all be achieved with the current resources.

By several criteria, biochemistry and biophysics is one of the most successful academic research units on campus. Currently the Department's success is reflected in the success of the faculty in competing for external funding for its research and instructional activities, as well as in national recognition of individual faculty in research and in instruction. In 2003-2004, 100% of the academic faculty had some form of external funding for their research. Over the past five years, \$28.5 million in direct funds towards faculty research have been achieved by the Department. This translates to an average of \$5.2 million per year to directly support these research efforts.

For comparison, the average from 2001-2004 generated by *all departments* in the College of Science was \$17.1 million. Members of the faculty have been recognized for the research accomplishments at many levels. For example the Department had three of its first eight faculty members named as OSU distinguished Professors. Several faculty members have received national awards including the Eli Lilly Award from the American Chemical Society, the N.I. H. James Shannon Director's Award and the N.I.H. Merit Award. Several members of the faculty hold editorial positions, participate in and chair national meetings and review panels, and have received faculty development awards for teaching.

The faculty has also been very successful in winning funds to improve undergraduate and graduate instruction. For example, major funding from the Howard Hughes Medical Institute permitted the development of new laboratory courses in molecular biology research techniques and has also supported innovations elsewhere on campus in a related biological teaching. Additional funding has been achieved to establish a stereo graphic classroom for the visualization of molecular structures and enhancement of computer laboratory resources.

While there is certainly much to celebrate here, it is worth noting that the faculty members who are most famous and brought a lot of recognition to the Department are quite senior or retired already. The Department has a strategic plan to increase the size and stature of the faculty and become one of the top 10 programs in Biochemistry in the western United States by 2015. The fulfillment of this vision depends a lot on how vigorously it can follow through with its plan of filling its positions with top-notch faculty and continuing its tradition of high quality research. If it is the desire of the Department and the College of Science that the Department of Biochemistry and biophysics retain and improve its national standing related to grant funding and research activities ***it is recommended*** that additional faculty positions (1 or more) be enabled for the Department.

In its strategic plan, the Department clearly recognizes the difficult task of maintaining and possibly enhancing its quality in view of declining state budgets. The plan to increase the number of faculty by 20% by requesting academic salaries on new extramural proposals is excellent and appears to have the support of the College of Science administration. Although the Department is unlikely to obtain new FTE positions using formulas tied to undergraduate teaching loads, the Department must leverage new FTE positions through joint appointments with other departments. The Department is somewhat engaged in such activities via the Computational Biology and Bioinformatics Initiative as well as through the Environmental Health Science Center. However, the Department seems to have missed other opportunities. For example, the Physics Department recently hired a considerable number of new FTEs. Biophysics is an emerging research area in Physics Departments throughout the country. There may have been an opportunity for the Department to strengthen its biophysics research program by possibly interesting the Physics Department in some area of biophysics that would also complement the research interests in their own Department. ***It is recommended*** that the Biochemistry and Biophysics Department take advantage of *every* possible opportunity for new hires, be it in their own department, the collaborative interdisciplinary programs in which they participate, or in any other department within the College of Science.

The Department has reasonable plans to direct scholarly growth in certain targeted areas, such as in mass spectrometry and computational biology, although many universities have already hired in these areas. Since the department is relatively small and major changes in the number of faculty will probably not occur in the next five to 10 years, *it is recommended* that in addition to targeted expertise, the Department should also consider focusing on a few programmatic areas, such as they are already doing with oxidative stress. Other programmatic areas could be related to a specific environmental problem in which x-ray diffraction, NMR, environmental biochemistry, mammalian genetics, or other tools can all be applied to the same topic. Funding institutions are definitely favoring the application of many types of tools to a specific important target area. Funding agencies are passing up the opportunities to support groups of people using one type of tool, wherein the applications are totally unrelated. If wisely chosen to complement the present research interests of departmental faculty, shared programmatic areas offer significant collaborative opportunities for faculty to address research problems with a broad array of techniques, including mammalian genetics, biophysics, molecular biology, and biochemistry. A thematic focus, employing interdisciplinary strategies, appears to be favored among the extramural funding agencies and offers the potential for the Department to develop a stellar national reputation in a few select research areas.

Adequacy of the Infrastructure

Facilities

Students, alumni, and outside reviewers all commented on the strong facilities, modern lab equipment and the number of state-of-the art instruments. The faculty members' success with grant awards is responsible for some of the equipment that has been added in the last 10 years. More than \$3M was generated in the last 10 years to buy sophisticated research equipment including a 600 MHz NMR/Micrococoil, an X-ray Facility shared with Chemistry, a Confocal Microscope, Rapid Kinetics, FTIR, Plasmon Resonance Spectroscopy, BioCAD perfusion chromatography, Yeast Knock-out and Antibody Display Library, a student computer lab, and a stereographics classroom. Almost all of this equipment included a match from OSU.

Administration and Department Governance

The Department appears to have made a successful transition from a long-term chair with a significant international reputation to a younger, energetic chair in mid-career. Presumably, the 10-year strategic plan for the Department reflects the vision of the present chair.

The departmental governance is very democratic and follows well-specified bylaws, procedures, and policies. The chair of the Department is reviewed every 3 years by the entire Department. There is an executive committee that helps the chair in executive matters, a graduate admissions committee that helps in admissions, a curriculum committee that monitors the curriculum changes, a promotion and tenure committee that evaluates junior faculty and makes recommendations on promotion and tenure. Most departmental decisions are made by voting and consensus by the academic faculty. There is a graduate advisor and an undergraduate advisor.

There appears to be a major disconnect between Dean Bloomer's vision and the Department's own perception of itself and their vision for the future. Given the Dean's need to take a big

picture view and the Department's need to stay focused on the Department, this is not entirely surprising. The Department sees itself as a nationally ranked Biochemistry and Biophysics research group and is planning to stay in that elite company. The Dean appears to view that the national rankings are not as important as being known for something. He seems to think that if the department decides on a small number of signature areas of concentration and builds strengths in those areas, he would be willing to support them. There is goodwill on both sides to take the department to the next level, but there also appears to be much listening to do on both sides. We hope that this report will help initiate a discussion on where the department should be heading and how. The Dean and the Chair need to agree on what criteria will be used to judge the Department's success or failures.

The Quality of the Outcomes

Professional Viability of Graduates

The students appear to receive good guidance and help in finding suitable post-doctoral positions as well as industrial opportunities. The survival guide the Department put together gives a lot of useful advice on where and how to find employment as well as other tidbits on how to survive the graduate school.

Initial positions held by graduates of the Department's graduate program include Postdoc, Harvard Medical School, Department of Biological Chemistry and Molecular Pharmacology; Postdoctoral research appointment at the National Institute of Health; Staff scientist at a national cancer center; NIH postdoctoral fellowship studying in the Department of Biochemistry at the University of Leicester; and Postdoctoral position at Beth Israel Deaconess Hospital.

National Program Rankings/Ratings

The 1995 survey of American Ph.D. programs conducted by the National Research Council ranked OSU in the top twenty percent of graduate programs in Biochemistry and Molecular Biology (36 out of 194). While a new survey has not yet been completed, the Department stated in their self study that "Maintenance of our position has occurred despite steady erosion of University resources."

There appears to be an over-emphasis on the national rank of the Department. Not only is it difficult to obtain a reliable rank, but the significance of the rank, save for the very top departments, remains obscure. The 2002 US News and World Report Survey ranked the Biological Science program as 75th of 138, but did not rank the individual disciplines, such as biochemistry or biophysics. The National Doctoral Program Survey did not grade or rank the Department of Biochemistry and Biophysics at OSU from a graduate student's perspective because only one student returned the questionnaire. Except for an external review, the noteworthy rank of the Department does not appear to be used for any purpose, such as faculty or student recruitment, as the rank is not mentioned on the departmental web site. Thus, emphasis on improving the national ranking of the Department in the strategic plan is without merit unless the Department has specific plans to use the rank in some way.

The National Research Council rankings are ten years old. The Department needs to rely less on these rankings as a tool to judge the stature of the Department. ***It is recommended*** that the Department find other metrics (funding per faculty, papers per faculty, research impact, quality of undergraduate and graduate students, and so forth) to use as a more frequent measure of the Department's national stature. This decision needs to be consistent with the means by which the Department is evaluated by the Dean and the University.

In summary, the external review committee met with faculty and students in the Department. The faculty and staff and their programs make a substantial contribution to research and teaching at OSU; the prospect for future contribution is great.

Third Appendix to the Minutes: Material distributed by Shing Ho

The faculty in the Department of Biochemistry and Biophysics would like to thank the Review Committee for its work in evaluating its Graduate Program and for preparing a well-balanced report on the Program. The tone of the report suggests that this is a strong program, with a very high degree of student satisfaction, and we take many of the recommendations made in the report as suggestions towards "fine-tuning" the program, rather than as needs for complete revamping of the program.

Our responses to the recommendations in the report are as follows.

It is recommended that the Department make use of its current graduate students in recruitment activities and other department activities. For example, they could advise and assist more in recruiting future graduate students by helping with items such as web page design and by undertaking speaking engagements. They could take more of a lead in organizing seminar series and in developing a journal club.

Response: The Department currently makes use of its graduate students for the following functions in recruitment:

- 1) Hosting visiting students***
- 2) Recommendations for what students are most concerned with in recruitment***
- 3) (Just started) presenting seminars and information sessions at undergraduate institutions***

In terms of seminars and a Journal Club:

- 1) Graduate students already have the responsibility of inviting and hosting one seminar speaker each year (this year, it was John Fenn, Nobel Laureate in Chemistry)»***
- 2) There was, up until 3 years ago, a BB graduate student run journal club that died due to lack of student interest. The Department will continue to encourage and support such efforts, with a faculty member as lead.***

It is recommended that the Department should study the reasons for the drop in the number of women students and take appropriate remedial actions. Also strong actions must be taken to actively encourage and recruit Hispanics and African Americans. The undergraduate population at OSU is an obvious recruitment pool, but the faculty might also network with other undergraduate institutions and encourage their students of all races and genders to apply to OSU.

Response: The Department has identified the issue of declining enrollment of women in our graduate program as a problem and has attempted to address this issue. We believe that this problem has arisen primarily from under-representation of female mentors on the faculty and the lean of the Department towards Biophysics in the past few years. Our recent hires have included more women (2 out of 4 hires in past 5 years were women, thus tripling the representation in the faculty) and in areas that are more biological (one cellular biologist and 2 developmental biologist), and we believe that these efforts will start to reverse this trend.

That being said, it is interesting that many of the female graduate students have or are pursuing their degrees in areas of Biophysics.

It is recommended that a formal or informal survey of students who decline admittance offers needs to be carried out. These applicants could be asked about specific reasons for their decision not to come to OSU including assistantship stipends, required coursework, and the match between their research interests and faculty in the department.

Response: The Department had initiated several years ago informal interviews with applicants who declined our offers of acceptance, as suggested. One of the primary reasons for applicants accepting offers elsewhere were related to the lack of an adequate healthcare program, and was the impetus for this Department taking a lead in trying to devise a plan for providing healthcare for Graduate Students. The healthcare issue is no longer a significant factor. The results from interviews of applicants from the past two years (since the current policy on healthcare for graduate students was established) have been too sparse to determine any trends.

Some recent responses include the following:

"UGA is expanding its biochemistry program. They recently brought in a number of new faculty, many of which have only a few graduate students (if any), yet have a substantial amount of money to spend on research. Furthermore, these new positions offer exiting frontiers in areas no other researcher is looking into (yet). A few of the faculty guaranteed a paper within the first year or year and a half. They also have just erected a new building called the complex carbohydrate research center, which also has a lot of room for more faculty and expansion. Furthermore, UGA has the largest NMR center in the nation.

Less importantly, Athens, GA is a lot like Madison in regards to the variety of things to do. It is 60 miles from Atlanta, a few hours from the Atlantic, and 45 minutes from the Appalachians. Like OSU, it offers a plethora of outdoor activities and the weather is better than in Wisconsin. It offers a slightly smaller stipend (\$18,500) than OSU, but since many of the faculty are looking for graduate students, this figure is debatable (I think you mentioned something like that when I was there, but that may have been UNC as well). Also, the southeast is cheaper than other parts of the nation.

The faculty was more concerned with me joining their own lab than in going to their school and thinking about rotating with them. So, the approach was a little different than what I was used to.

I hope this helps to rationalize my choice, and aids in your own future recruitment."

"I am writing to let you know that I will not be accepting your offer of admission. I am going to be attending at USC in their Molecular and Computational Biology department. This had been a very difficult decision but one we feel comfortable with. Thank you so much for your time and hospitality!" (from a student who completed a degree from OSU)

"BB program at OSU is great. In fact it was tough for me to decide between the options I had. The only reason where OSU scored a negative point is health insurance. If OSU had provided for my health insurance, I would certainly have opted for BB program at OSU."

"I wanted to let you know that I have decided not to attend OSU for my graduate work. I take no pleasure in writing this letter, but I did want to let you know that this decision was an extremely difficult one and I am glad I only need to make it once. OSU has an excellent program and wonderful scenery to boot and I was very flattered by your offer. Thank you for allowing me to come visit OSU and speak with the professors."

"Unfortunately I cannot attend OSU due to personal reasons, which I think you know of, and so I will have to remain in Southern California. I appreciate all that you did for me during the interview and outside the interview. You have a great campus with great research and the Linus Pauling Center is amazing."

It is also recommended that the Department needs to seek further advice through a recruitment consultant to identify best methods for determining what works and what doesn't work well in recruitment.

Response: We may pursue this, but our ability to do so will depend on the available resources. Such an effort may be best done at the College level, since this is not the only Department in the College of Science to face such issues in graduate recruitment.

It is recommended that the Department consider whether recruiting from their undergraduates might be an option that should be more actively pursued.

Response: We, as most graduate programs in biochemistry across the country feel, do not believe that it is in the best interest of the STUDENT to encourage them to stay at OSU to continue their graduate work (with the exception of MS students). We consider each case individually, and no longer deny students admission to the program based solely on having an undergraduate degree from OSU. However, we continue to believe that it is in the best interest of the student to pursue their advanced degree elsewhere in order to provide a broader perspective and training in the fields of biochemistry and biophysics.

It is recommended that the faculty develop a variety of opportunities at which students may interact across the Department with fellow students and department faculty.

Response: The Department currently holds a picnic in early Fall to introduce incoming students with current students (this is run by the second year Graduate students) and a Department-wide softball game at the end of Spring term. We will continue to encourage the reestablishment of a journal club and a Graduate Association.

It is recommended that the Department begin to systematically collect data that would enable the Department to explore whether the use of the word "biophysics" in the Department title promotes or deters the recruitment of graduate students.

Response: We do not believe that a Department should change its name just for the sake of recruitment. It is the Department's opinion that such a change must come from a fundamental realignment of the Department's mission to NOT have a focus in biophysics before making such a name change. In doing so, however, we believe the Department will lose its unique character.

It is recommended that students be made aware of the dollar amount of student fees when they are sent information about their admittance into the program and the offer of a GT A position.

Response: Up until last year, the per term fees were spelled out in the letter of offer to students. This year, we have raised stipends to \$21,000 and have offered \$500 during the first term to cover the "matriculation fee" imposed by the University. We will include all information concerning fees again in the letter of offer, as suggested. We should note that a much of the students fees are imposed by the students upon themselves and if the graduate students see no benefit to them, they should consider becoming involved in student governance to change them.

Several recommendations relate to the need for the department to consider what outcomes it desires of its graduate programs. After determining what outcomes are desired and needed ***it is recommended*** that the Department consider revamping its core requirements, that the Department review the preliminary doctoral examinations, and that the department consider offering technical writing, bioanalytical methods, and grantsmanship courses.

Response: The 36 credit "real course" requirement is minimum requirement defined for a course of study towards a Ph.D. as defined by the Graduate Council at OSU (we note that there seems to be some flexibility now in this minimum, and will pursue this). Still, we must ask what this Department wants to be in a very fundamental way before we start tinkering with the curriculum. The degree of satisfaction of our graduates (and, anecdotally, from their employers after graduating from OSU) suggests that the current course of study works very well for what it was intended to do.

A course on bioanalytical techniques (Biophysical Methods) is offered in the Department every year by Prof. Sonia Anderson. Many of our graduate courses use grant proposal writing as a means of evaluating student performance.

Graduate Student and Faculty Interaction

It is recommended that methods for improving intra-departmental communications be developed. As a corollary to ***this it is recommended*** that the Department review its policies regarding graduate students' lab experiences and that these policies are clear to both faculty and graduate students.

Response: We will again encourage the Graduate Students in the Department to reestablish a Graduate Association. As the Chair had indicated to the Committee during the exit interview, this Association, in its prior incarnation, allowed formal student-faculty communication on

procedures, grievances, and other matters. The Association had dissolved itself over conflicts concerning the establishment of a Graduate Student Union on campus. The Department will provide the incentives needed for the students to reestablish this group.

Faculty and Faculty Performance

If it is the desire of the Department and the College of Science that the Department of Biochemistry and Biophysics retain and improve its national standing related to grant funding and research activities *it is recommended* that additional faculty positions (1 or more) be enabled for the Department.

Response: We cannot agree more! We are attempting to add new members to the faculty through the Provost Initiative in Computational Biology, and in coordinating efforts with the Environmental Health Sciences Center and the Linus Pauling Institute, among others.

It is recommended that the Biochemistry and Biophysics Department take advantage of every possible opportunity for new hires, be it in their own department, the collaborative interdisciplinary programs in which they participate, or in any other department within the College of Science.

Response: We will continue to participate in all faculty recruitment efforts, including those that are outside the Department, when we are invited to. We had previously participated in recruitments in Chemistry and Zoology. The current Chair had a number of conversations with the Chair of Physics concerning their recent recruitment efforts, with the discussions centering on what areas in biophysics have seen significant contributions from Physics Departments at other Institutions, and how various Centers and units (including ours) across the OSU campus could help in their efforts to develop competitive startup packages and to provide adequate space and facilities. Unfortunately, we were not invited to participate in these recruitments, suggesting that the Physics Department made a decision that biophysics was NOT an area of interest for them.

It is recommended that in addition to targeted expertise, the Department should also consider focusing on a few programmatic areas, such as they are already doing with oxidative stress.

Response: We have done this with oxidative stress (historically, has been a strength), and are doing this in structural biology, including the submission of an NIH Roadmap Grant Proposal to develop a Center to study macromolecular structure and dynamics by mass spectrometry. It should be noted, however, that such areas of programmatic strength are best served across departments. For example, there is a developing strength in the area of nucleic acid structure (in RNA and DNA), but this is through collaboration between Biochemistry and Biophysics and the Department of Botany and Plant Pathology. The strength in oxidative stress is continuing to be fostered through associations with the EHSC and LPI. It would be difficult (and risky) to build a sufficiently large group within a single department in the life sciences at

OSU (because of the nature of the Departmental and College structure) to develop a single area of expertise in any individual department.

Quality of Outcomes

It is recommended that the Department find other metrics (funding per faculty, papers per faculty, research impact, quality of undergraduate and graduate students, and so forth) to use as a more frequent measure of the department's national stature. This decision needs to be consistent with the means by which the Department is evaluated by the Dean and the University.

Response: The use of national ranking of the program in defining its stature, especially in defining the goals of the Strategic Plan, was, in fact, based on the metrics used by the College and University in defining their own goals. We note, for example, that the stated goal of the University is to become one of the top 10 Land Grant Universities in the country. The goal of the College of Engineering is to become one of the top 10 Engineering Programs in the country. These are goals that the community (within and outside of OSU) can understand and, therefore, can support. In the strategic plan, there are specific goals for certain areas, including oxidative stress, structural biology, and molecular and cellular biology, and these are all coordinated to reaching an overall goal. Such metrics as funding and papers per faculty become part of the national ranking. The recommendation from the report that we should use these metrics in graduate recruiting is well taken.

APPENDIX C

From Molecules to Mice: A Strategic Plan for Development and Growth in The Department of Biochemistry and Biophysics at Oregon State University

I. Goals and objective

The goal of the Department of Biochemistry and Biophysics at Oregon State University for the next ten years is to become recognized as one of the top ten programs in Biochemistry and Biophysics in the Western United States according to the National Research Council or NRC rankings. The incremental objectives and incremental steps to achieve this goal are stated below.

A. Objectives:

- 1) (Years 1-5) Recognized as one of the top 10 programs on the West Coast (west of the Rocky Mountains), and
- 2) (Years 5-10) Recognized as one of the top 10 programs in the Western United State (west of the Mississippi River).

B. Steps towards these objectives for the next 10 years (2005-2015):

- 1) Increase faculty size by at least 20% by adding 3 or more new faculty members.
- 2) Increase overall external funding that supports faculty research programs
- 3) Add at least 2 faculty members to the National Academy of Sciences:
 - a) Hiring at least one faculty member of national stature,
 - b) Elevate at least one current member of the faculty to the NAS.
- 4) Increase number, quality, and diversity of applicants and matriculated students in the Graduate Program by:
 - a) Establishing Graduate Fellowships to attract and support strong applicants,
 - b) Outreach by faculty members and current graduate students to Colleges and Universities in the region and nationally,
 - c) Establishing at least one training grant to support graduate students.
- 5) Increase the number and quality of postdoctoral research associates.

All of these steps are interrelated. To attract highly qualified graduate students and postdoctoral associates, the Department must have a national reputation and strong individual faculty research programs. To attract quality faculty, the department must be attractive to high quality graduate students and postdoctoral associates. Thus, these incremental steps towards our objectives will be pursued in parallel. This strategic plan was drafted to define steps that can be taken by the Department to move towards each of these goals, with plans to fund new faculty hirings that take advantage of the Department's abilities to secure extramural funding for research and instruction, of initiatives presented by Centers on campus with strong ties to the department, and that ties the Department goals with those of the Capital Campaign at OSU. Although there is a recognition that improving graduate and postdoctoral associate recruitment and retention is important, the current Strategic Plan focuses primarily on improving the recognition of the Program through strategic growth in the Faculty, which are the primary factors in increasing its regional and national stature and are important for recruitment at all levels.

II. Department Standing

The Department of Biochemistry and Biophysics is currently ranked 39th out of 199 programs nationally according to the 1993 NRC survey, tied with the University of Minnesota and the University of Southern California. Among Biochemistry programs, the Department ranks 11th with USC on the West Coast (west of the Rocky Mountains) and 15th with the University of Minnesota and USC in the Western US (west of the Mississippi River). The programs that are currently ranked at and above OSU in these regions are shown on Table 1 along with their faculty sizes.

Table 1. 1993 NRC Ranking of Biochemistry Programs on the West Coast (west of the Rocky Mountains) and in the Western United States (west of the Mississippi River). The faculty size count includes tenured and tenure-track Assistant, Associate and Full Professors, and do not include Affiliate Appointments or non-tenure-track positions.

Regional Rank	Region: West Coast	Region: Western United States	Faculty size
1	University of California San Francisco		26
2	Stanford University		18
3	University of California Berkeley		32
4	California Institute of Technology		41
5	University of California San Diego		32
6		University of Colorado	28
7		Washington University	19
8	University of California Los Angeles		21
9	University of Washington		27
10		Baylor School Medicine	32
11		University of Texas Southwestern	34
12	University of Oregon		20
13	University of Utah		12
14	University of California Davis		116
15	University of Southern California		24
15		University of Minnesota	43
15	Oregon State University		15

The University of Utah Biochemistry Department is associated with the Medical School, which has no undergraduate teaching mission and lists an additional 12 faculty members with primary research in Biochemistry.

III. Challenges

A. Faculty Size: There are many challenges that we must overcome to achieve our objectives. The first, which is obvious from Table 1, is that we must dramatically increase the size of the Department faculty. With the exception of the University of Utah (which does no undergraduate instruction), the Department of Biochemistry and Biophysics at OSU has the smallest faculty of all the programs in Table 1. Realistically, it would be very difficult to supplant programs with faculty sizes that are two to ten times that of our current faculty. In addition, it is unlikely that any of the top 5 programs will drop significantly from their current standings. It would be realistic, therefore, to potentially move up to or above those programs with 21 or fewer faculty members that are currently ranked below the top 5. These include (in order of current standings) Washington University, UCLA, University of Utah, and the University of Oregon. Such a move would require a substantial investment in resources to increase the current faculty size to at least

the average for these programs (average faculty size = 18 for these four schools), equivalent to adding at least 3 full time faculty members to the Department.

B. Faculty recognition: Increasing the size of the faculty, assuming each new faculty contributes on an equal basis with the current faculty to all factors associated with the rankings, would only get us to the 11th spot in the Western US (or 8th west of the Rocky Mountains). Without nearly doubling the current size of the Department, it would be impossible to catch the next program (at 27 faculty members) just by size alone. Thus, it would be the quality and recognition of the faculty that will need to be improved in order to reach our goals. The challenge here is that since the 1993 NRC rankings, the Department has seen the retirement of three highly recognized faculty members (including the Department's lone member of the National Academy of Sciences) with large and well-funded research programs. At this point, the demographics of the faculty in the Department can best be described as mid-career. Although there are several members of the faculty who are building strong research programs and reputations (and who will be the foundation of a strong program for the future), there is a gap in stature at the top end of the faculty. Thus, as the Department plans for growth to increase the overall size of its faculty, there needs to be an effort to fill at least one of those positions with a scientist that already enjoys a strong national presence.

C. Graduate Program: The current total number of graduate students in the Department is 20. This is the size of entering classes at many of the top ranked programs. One of the primary challenges in this program is. to increase the number and quality of applicants from qualified undergraduate students from US institutions, and improve our ability to attract the best applicants to OSU.

Factors that affect the number of applicants received by the Program include:

- 1) National reputation of the Department and its faculty
- 2) Competitive stipends and benefits
- 3) Successful advertising of the Program nationally
- 4) Success of former students

Factors that attract students to the program include:

- 1) Broad range of research opportunities
- 2) Stability in funding
- 3) Atmosphere of a Graduate culture

D. Attracting Postdoctoral Associates: There are currently very few postdoctoral associates in the department, suggesting that the Department is attractive to highly qualified applicants. The factors that affect the number of Postdoctoral Associates in the Program include:

- 1) National and international reputation of the Department and its faculty
- 2) Levels of Grant funding
- 3) Successful advertising of the Program nationally
- 4) Career training opportunities

IV. How to reach our goals

In order to achieve its goals, the Department will play on its strengths, but recognize the need to maintain a faculty with a broad range of research interests. This latter point is important because of the strong instruction mission of the Department and because the field of Biochemistry and Biophysics is dynamic and unpredictable. The current strengths of the Department lie historically in Biophysics (more now in Structural Biology) and in metabolic and environmental biochemistry (through its ties with the Linus Pauling Institute and the Environmental Health Sciences Center, but also through the focus of several faculty research programs in oxidative stress). A potential area of strength for the Department is in cellular and developmental biology, but this relies on the future success of junior faculty members.

A. Growing the core faculty:

Strategy for New Faculty Staffing: In order to increase the stature of the Department and to provide research opportunities for graduate students and postdoctoral associates, the Department needs to increase its faculty size. The strategy for staffing includes a plan to direct growth in certain targeted areas (focusing on current and emerging strengths in the Department) and mechanisms to fund those positions. At the same time, it is crucial that the Department develop a plan to maintain breadth in the general areas of biochemistry and molecular biology. The plan is to add faculty in the recognized area(s) of strength (structural biology, and metabolic and environmental biochemistry), areas required to maintain broad expertise in biochemistry and molecular biology, and areas of emerging strength.

1. Biophysics/Structural Biology (1-2 new faculty): The Department currently has good representation in the areas of X-ray crystallography and spectroscopy. The areas of continued growth will be in mass spectrometry and computational biology. Growth in mass spectrometry is best accomplished in conjunction with the Environmental Health Sciences Center at OSU and, therefore, is dependent on continuing support for the Center. There are immediate opportunities, however, to grow in the area of computational biology through the recently approved Provost's Initiative in Computational Biology and Bioinformatics. Other potential areas of growth include biological nanotechnology through coordination with ONAMI initiatives. The overall goal is to become recognized as a tier 1 program in Biophysics/Structural biology on the West Coast. The biophysics/structural biology programs on the West Coast (west of the Rocky Mountains) are listed in Table 2, along with the level of recognition (as perceived by a group of faculty) for those programs. Comparing the available data shows that many of the programs that currently rank above OSU as biochemistry programs (Table 1) also rank above OSU in the area of structural biology (Table 2). Although there is likely no direct cause and effect, one strategy to becoming better recognized as a biochemistry program on the West Coast would be to move the Department from a tier 2 to tier 1 structural biology program.

Table 2. Structural Biology Programs¹ West of the Rocky Mountains and perceived rankings (Tier 1 and Tier 2). Those not considered in the top 2 tiers are not ranked

State	Institution	Tier 1 (1) or Tier 2 (2)
Arizona	Arizona State University	2
	University of Arizona	
California	California Institute of Technology	I
	University of California Berkeley	I

	University of California Davis	2
	University of California Irvine	
	University of California Los Angeles	I
	University of California Riverside	2
	University of California San Diego	I
	University of California San Francisco	I
	University of Southern California	2
	Scripps Oceanographic Research Institute	I
	Stanford University	I
Colorado	Colorado Health Science Center (Denver)	
	Colorado State University	2
	University of Colorado	I
	University of Denver	
Idaho	Idaho State University	
	University of Idaho	
Montana	Montana State University	
	University of Montana	
Nevada	University of Nevada Las Vegas	
	University of Nevada Reno	
New Mexico	New Mexico State University	
North Dakota	University of North Dakota	
Oregon	Oregon Health and Science University	
	Oregon State University	2
	Portland State University	
	University of Oregon	1-2
South Dakota	South Dakota State University	
	University of South Dakota	
Utah	Brigham Young University	
	University of Utah	
Washington	University of Washington	I
	Washington State University	

¹Programs with research in at least one of the following areas: X-ray crystallography, NMR and mass spectrometry, molecular modeling and single-molecule methods)

2. Metabolic and environmental biochemistry (dependent on the LPI and EHSC): This area of strength is directly tied to the strength of the Linus Pauling Institute and the Environmental Health Sciences Center, and growth in this area will be left to the Institute. The Department will continue to facilitate the growth of the LPI by providing a tenure home to scientists in that Institute who are qualified in areas of biochemistry and/or biophysics and who fit the mission of the Department.

3. General areas of biochemistry and molecular biology: One of the primary strengths of the Department is that it provides a breadth of expertise in the general areas of biochemistry and molecular biology. Recent and pending retirements, however, have and will continue to erode areas that include protein and nucleic acid chemistry and biochemistry. The challenge for this Department is to provide resources to maintain and grow in these areas, despite fiscal constraints imposed by the greater strategic plans at the College and University levels.

4. Cellular and developmental biology: This is an emerging area of strength for the Department, but is primarily dependent on the future success of three junior faculty members, currently at the Assistant Professor level. The direct relationship of these areas to human and animal health, however, makes them the most appropriate for development through the College of Science and the University's Capital Campaigns.

Mechanisms for funding new faculty positions: The major impediment to growth in the size of the Department faculty is the dependence of Department funding for faculty lines on General Funds through the College of Science. These funds are currently strongly tied to contributions to teaching (measured by quantity and not necessarily quality) rather than research. In order for the Department faculty to grow, there needs to be a new formula to fund faculty salaries and startup packages. The following are the immediate, medium range, and long-range steps that the Department can take towards the goal of increasing the size and stature of the faculty.

1. Provost's Initiative (1-3 years): The first round of funding under the Provost's Initiative includes a program in Computational Biology and Bioinformatics. The approved plan will add 3 new faculty members under the Center for Gene Research and Biotechnology, with eventual assimilation of these scientists into home Departments funded partly or fully by the respective Colleges. Although there is no guarantee that any of the 3 new faculty members will land in a particular department, the Department Biochemistry and Biophysics was a strong supporter of this Initiative and our strength in Structural Biology should make us an attractive tenure home for a scientist with interests in the areas of Computational Biology and Bioinformatics. This initiative, however, is an ideal opportunity to directly fund the planned growth in the targeted area of Structural Biology. To take advantage of this opportunity, there are immediate steps that the Department faculty needs to take:

- a) Faculty members in Structural Biology and Biophysics need to become involved in the Search Committees, interviews, and selection process.
- b) The faculty must insure that we are attractive to a potential candidate, but also must insure that a candidate meets the requirements of the Department (recognizing that all members of the faculty are involved in the instruction mission).
- c) The Department must be willing and able to provide space and possibly contribute toward startup packages.

This is an immediate opportunity to attract into the Department ~ scientist with national stature and in a recognized area of strength. More towards the future, the faculty of the Department should develop a plan to submit a new proposal if and when the next round of Provost Initiatives is announced. One area that we should consider for such an initiative would be **biological nanomaterials** (to take advantage of NSF and ONAMI initiatives).

2. Non-Institution funding (1-5 years): With its strong association to the Linus Pauling Institute and the Environmental Health Sciences Center, the Department has several faculty members that are partly or fully funded by mechanisms other than the University's General Funds. The Department, however, cannot rely entirely on such mechanisms to grow its faculty. The core of the faculty (representing only 12 members) is constantly pressured by growing instructional duties (as the population of undergraduates at OSU grows). The Department will define specific mechanism to self-fund one to two junior faculty lines. In previous years, the size of the Department faculty was larger (by 1-2 positions) than could be supported by the General Funds budget. At that time, the extra FTEs were funded by frequent sabbatical leaves and faculty career development awards. There are currently few sabbatical leaves, and career development award opportunities are now rare. However, there are opportunities to use grant funds to help fund new faculty lines. Members of the faculty will be encouraged to put at least one term of their academic salary on grants to support a larger faculty without relying on College of Science

funding. The advantage to these faculty members is that they reduce their instructional load (being able to focus and thus become more competitive in the research arena). The Department can use this approach to fund general areas that are important to biochemistry and molecular biology as part of its mission to provide broad expertise for instruction and for graduate training (and through a mechanism that is not directly tied to the College of Science). This mechanism can be set up immediately, but will require 1-3 years to buildup (to allow faculty the time to budget salary release into new grant proposals or competitive renewals). The objectives and timeline can be defined as follows:

- a) Year 1-3: Have, on average, 2 BB Faculty members fund 1 term each of their 9 month salary on grants and contracts on a continuing basis beyond year 3.
- b) Year 3: Hire first junior faculty member, using accumulated salary savings for startup package, and salary funded by continued "buy-outs" as outlined in a) above.
- c) Year 3-5: Have an average of 4 BB Faculty members fund 1 term each of their 9 month salaries on grants and contracts on a continuing basis beyond year 5.
- d) Year 5: Hire second junior faculty member, using accumulated salary savings for startup package, and salary funded by continued "buy-outs" as outlined in a) above.

In order for this mechanism to work, the College of Science and the Department must commit to the following:

- a) College of Science: The COS must commit to maintaining at least the current level of support from General Funds and must commit to returning all salary and benefit savings to the Department to be used for recruitment purposes.
- b) Department: The Department will commit to expanding its overall research funding levels. The specific objectives to achieve this include:
 - 1) (Years 1-5) Set as a goal that every faculty member have an externally funded ROt type grant within 2 years of joining the Department
 - 2) (Years 5-10) Set as a target an average of 2 externally funded ROI type grant per faculty member.
 - 3) (Years 3-10) Shift much of the current NSF funded research programs to NIII funded programs.

3. Development (1-10 years): The Department will identify specific areas and problems that would tie in with the OSU Capital Campaign, with the push to fund a senior faculty position in the area of human or animal health. Some potential areas of concentration would be the biochemistry of **aging, cancer, neurodegenerative diseases** (for example, ALS) and **environment related** diseases. This would be the best opportunity to attract a scientist onto campus with a national and international reputation (at or approaching the level of the National Academy of Sciences). This will require engagement of the faculty in the campus-wide Capital Campaign, helping to identify potential donors with the ability to fund (or contribute to funding) a named Professorship or a Chaired Professorship. To align this with the goals of the College of Science and University goals, the emphasis for this initiative will be in the area of human or animal health. This fits into the plan to grow the faculty in an emerging area of strength, and provide a readily "sellable" concept to potential donors. In addition, these areas are aligned with the ongoing efforts to develop a **transgenic animal facility** at OSU.

B. Building stature and research opportunities from current non-BB OSU faculty: This Department has always had a strong Affiliate Faculty program. This program was put on hiatus as we reconsidered the rights and responsibilities of such faculty . We plan to reinvigorate this program starting this year. The goals are:

1. Year 1: Thin the current list of affiliate faculty by removing those Affiliate Faculty that have not contributed to the Graduate Program in the past 5 years,

2. Years 1-5: Invite new additions at the junior and senior levels to develop a list of Affiliate Faculty that is equal in size to the full faculty.

C. Graduate and Postdoctoral Recruitment and Funding:

1. Fellowships: One strategy that can have a major impact on recruiting of high quality graduate students and postdoctoral associates would be to establish at least one Graduate Fellowship that guarantees some level of support for four years to one incoming student each year and one Postdoctoral Research Associate that provides support for three years. These are two high priority goals for Development. Assuming \$30,000 per year to fully support a single graduate student (stipend plus tuition) and an annual payout at 5% from an endowment, the Department will need to raise \$600,000 to establish a fully funded Graduate Fellowship. Each fully funded Postdoctoral Fellowship will require funding of at least \$55,000 at current NIH rates (salaries plus benefits). An endowment for one such fellowship would thus be at least \$1.1 million. At these rates, it would be more reasonable and effective to focus all of our energies on Development efforts for a Named Professorship. However, we would argue that such Fellowships should be used to support students in funded laboratories. Therefore, a reasonable strategy would be to define Graduate and Postdoctoral Fellowships that fund HALF of these anticipated costs, with half from research grants of the respective laboratories. Thus, the endowments that would need to be raised to establish graduate and postdoctoral fellowships would be \$300,000 and \$600,000, respectively. Our Development objectives are:

2. Outreach and direct recruitment: One strategy to increase the pool of qualified applicants to the Department graduate program is to have faculty visit Universities and sell the Department and its research. Traditionally, this has relied solely on invitations from Institutions to individual members of the faculty to present seminars to other research programs and departments. We will take advantage of this mechanism by tying these invited seminars to recruitment for our Graduate program. However, the Department cannot sit and wait for such invitations, and there are many smaller universities and colleges (from which we have had success in recruiting students) that do not fund research seminar programs in biochemistry and biophysics. Thus, the Department will start a program to send faculty out to specific institutions (both regional and national) as a proactive outreach effort. The objectives of this initiative are to:
 - a. Associate recruitment of Graduate students with scientific seminars at those Colleges and universities that have undergraduate programs. To do this, we will provide all faculty who plan to present scientific talks at undergraduate institutions with Department postcards and posters for distribution, and ask that such faculty request at least one hour to meet with junior and senior undergraduates to describe the training opportunities available in the Department Graduate Program.
 - b. Send members of the faculty and current graduate students to Colleges and Universities to present scientific seminars and to advertise the Department Graduate Program. The Department will fund 5-6 members of the faculty to present scientific seminars. We will target smaller institutions that have undergraduate programs in chemistry and in biology, and at least 2 such trips will be to institutions that are traditionally associated with underrepresented groups in the areas of Biochemistry and Biophysics. The travel expenses of the faculty member will be borne by the Department of Biochemistry and Biophysics at OSU. As a requirement, the faculty member or student will request at least one hour of access to junior and senior undergraduates in the host department for the purpose of recruiting applicants to our Graduate Program.

Fourth Appendix to the Minutes

MASTER OF ARTS IN INTERDISCIPLINARY STUDIES

GRADUATE COUNCIL FOLLOW-UP PROGRAM REVIEW 2005

A follow-up review of the Master of Arts in Interdisciplinary Studies (MAIS) degree program was conducted during spring of 2005. Vicki Ebbeck (College of Health and Human Sciences) and Bill Boggess (College of Agricultural Sciences) met with Ann Schaubert who serves as the Director of Interdisciplinary Graduate Programs. The purpose of the meeting was to ascertain the extent to which recommendations outlined in the 2002 Graduate Council Program Review of the MAIS have been adopted. This follow-up report provides a general overview of program compliance with the recommendations, as well as a brief description of any actions that have occurred in relation to each of the specific recommendations.

Overview

It is evident that faculty associated with the MAIS program have considered each of the recommendations outlined in the 2002 Graduate Council Program Review of the MAIS. In general, the MAIS program continues to evolve in response to the various recommendations. Some changes have already been implemented, while other changes are proposed or in the planning stages. Changes that have been implemented include the development of a vision statement, the formation of an advisory committee, the department representing the primary field taking responsibility for and being credited with MAIS students, and the identification of a faculty member from the primary field before an applicant is accepted to the MAIS program in order to facilitate the advising process. The adoption of the other recommendations has yet to occur but will result when a Category I proposal that has been written to create a parallel MSIS degree is submitted and approved, an MAIS Admissions Screening Committee is established and starts operating as expected in fall of 2005, a transition plan for the MAIS program to align with the policy that 50% of credits be graduate-only courses is formulated and submitted, and two new courses that are currently being developed become regular curriculum offerings.

Only a single recommendation of all the primary and secondary recommendations outlined is not slated for adoption. The recommendation was that three fields of study be required in a MAIS program with no two fields of study from the same department. The intention at present with the MAIS program is to have students bring together three fields of study, however, there will be no stipulation as to the minimum number of departments that must be involved. The reasoning for the original recommendation was to ensure that the MAIS program indeed attracted students truly interested in adopting an integrated perspective and did not serve as a surrogate discipline-based degree. It is not unusual for discipline-based degrees to necessitate work from two departments in order to meet major and minor course requirements and so coursework from three departments would have further assured the uniqueness of the MAIS experience. Nevertheless, the counter argument posed for allowing the possibility of coursework from less than three departments is that now a more rigorous admissions process will be implemented. Admission will now involve pre-advising, an application essay, and a screening admissions committee that will bolster the likelihood of admitting only those students genuinely interested in pursuing an integrated approach irrespective of the number of departments involved. We are cautiously

optimistic, but not convinced that these new procedures will ensure that the MAIS does not continue to function as a surrogate discipline-based degree in some cases. We recommend that the Graduate School carefully monitor this aspect and continue to encourage the development of appropriate disciplinary degrees.

Responses to Specific Recommendations

Primary Recommendations

- Establish a clear vision of the educational purpose of the MAIS that should be to provide students with a true interdisciplinary experience.
A vision statement for the MAIS program was written by the MAIS Advisory Committee in September of 2004. The vision statement highlights the educational purpose of integrating or synthesizing information to provide a more holistic insight.
- Require three different fields of study in a MAIS program with no two fields of study from the same department.
A draft of a Category I proposal requires three different fields of study for the MAIS, however, two or three of the fields of study could come from the same department.
- Eliminate the requirement that one of the fields of study be from the College of Liberal Arts.
A draft of a Category I proposal eliminates the requirement that one of the fields of study be from the College of Liberal Arts.
- Each applicant should identify the intended primary field of study and, if the applicant is accepted, the department representing the primary field should take responsibility for and be credited with the MAIS graduate student.
Each applicant does identify a primary field of study and now the department representing the primary field takes responsibility for and is credited with the MAIS graduate student.
- Require each applicant when completing his or her letter of intent to describe an issue that lends itself to an interdisciplinary perspective and offer a plausible suggestion of how two or more specifically identified disciplines could be integrated to address the issue.
The admission process has been modified to now require applicants to write an essay describing their interest in interdisciplinary work. An MAIS Admissions Screening Committee will be established in fall of 2005 to evaluate the essays to determine if each applicant makes a convincing case for interdisciplinary study.
- Require that at least 50% of the credits (excluding blanket-numbered credits) on any MAIS program of study be graduate-only courses.
This policy has now been approved by the Faculty Senate and will go into effect September of 2005 for all graduate programs at OSU. The MAIS program will submit a transition plan.
- Require that every MAIS thesis or research paper integrate at least two of the three fields of study.
A draft of a Category I proposal speaks to the thesis and project curriculum requirements integrating knowledge from two or three fields of study.

Secondary Recommendations

- Offer a Master of Science in Interdisciplinary Studies (no language requirement) as well as a Master of Arts in Interdisciplinary Studies (language requirement consistent with a Master of Arts degree).

A draft of a Category I proposal incorporates the addition of a new interdisciplinary program leading to the Master of Science of Interdisciplinary Studies (MSIS). The MSIS would not have a language requirement, while the MAIS would have a language requirement consistent with other Master of Arts degrees at OSU.

- Form a MAIS Advisory Committee comprised of representatives from the Graduate School and faculty involved with the MAIS degree to be responsible for reviewing and improving degree requirements and implementation.

An MAIS Advisory Committee has been established and operational since spring of 2004. The committee is comprised of representatives from the Graduate School and faculty involved with the MAIS degree.

- Clarify the operational differences between the thesis and research project options.

The MAIS Advisory Committee has created a draft of a document that explains the similarities and differences with theses and projects.

- Require that an MAIS program committee chair from the intended primary field be identified before an applicant is accepted to the MAIS program to facilitate the advising process.

Prospective MAIS students are now encouraged to locate a faculty member from each of the three fields of study who will support their efforts before submitting an application. Meetings held once a term for students admitted to the MAIS program also now facilitate the advising process. The meetings involve guest speakers as well as the opportunity for students to ask questions and learn from each other.

- Require at least one integrative course in every MAIS program of study (e.g., Systems Thinking and Practice that is cross-listed as BA 565, ENGR 565, H 590, and HORT 590). Two new courses, currently in development, are proposed for both MAIS and MSIS students. A 1-credit course (IS 511: Introductions to Interdisciplinary Graduate Studies) will be taken in the first year of study and a 3-credit course (ISI 512: Applying an Interdisciplinary Perspective) will be taken in the second year of study.

GRADUATE COUNCIL MEETING

May 5, 2005

3:00pm, MU Board Room

Present: Pehrsson (co-chair), Steel (co-chair), Bond, Ciuffetti, Filtz, Francis, Koenig, Pedersen, Rettig, Rockey, Strickroth, Tadepalli, Unsworth, Waldschmidt

Absent: Brown, Selker

Guests: Deborah Healey, Director -- English Language Institute

I. Approval of Minutes

The minutes from the April 21, 2005 meeting were reviewed by Council members. Barbara Bond recommended that page 3 of the minutes be amended to reflect that Nuclear Engineering would be treated no differently than any other department that may be interested in deviating from the standard residency requirement. Prasad Tadepalli asked that the minutes be amended to show that he was not present. A motion was approved to accept the minutes as amended.

II. Update on PhD Learning Outcomes

Dale Pehrsson reported that a subcommittee of several Graduate Council members met last week to examine doctoral residency issues. The subcommittee determined that the issue is very complex and there is an increasing concern that consideration of policy revisions is a matter that should not be rushed. Pehrsson was asked by the subcommittee to synthesize ideas from readings that have been shared with the Graduate Council, with emphasis on ideas that might be considered for endorsement at OSU. Using this information, she will prepare a draft of a document that will describe OSU's desired PhD learning outcomes. That draft was to be distributed to all Council members for review and comment. To inform the Council about trends that exist nationally, members of the PhD learning outcomes subcommittee took on the task of researching the residency requirements of our comparator institutions, including some of our "wish-list" institutions. Several examples of residency requirements at other institutions were shared with the Council, as follows:

Several examples of residency requirements at other institutions were shared with the Council, as follows (some of the following summaries are taken from university web sites and some are paraphrased language based on university web sites):

- Iowa State University – A minimum of 72 graduate credits must be earned for a Ph.D. At least 36 graduate credits, including all dissertation research, must be at ISU. At least 24 of these credits must be earned during two consecutive semesters or during a continuous period including two semesters and a summer session while in residence at the university. (This requirement does not apply to doctoral students who are employed half time or more at ISU or government laboratories in Ames.) There is no specific university requirement regarding the number of credits to be taken inside or outside the major/program.
- University of Illinois – Doctoral degree programs are divided into three stages (master's degree, additional studies following the master's degree and ending with an oral

preliminary examination, and at least one year completing a dissertation) and must include the successful completion of a minimum of 96 semester hours of graduate credit as well as the preliminary and final examinations. At least 64 of the hours, which may include thesis credit, must be earned as residence credit.

- Texas A & M — A major purpose of the residence requirements for graduate degrees is to ensure that the student has an opportunity to benefit from the advantages of a university environment. These advantages include not only the accessibility of library, laboratory and other physical facilities, but also the opportunity to participate in seminars and a variety of cultural activities. Equally important to the graduate student are the advantages of becoming acquainted with the faculty and other students on both a personal and a professional basis. A student "in residence" is expected to devote most of his or her time and energy to graduate studies under the direction of the student's major professor and the advisory committee. Another major purpose of the residence requirements for graduate degrees is to ensure the faculty the opportunity to properly evaluate the student and his or her development in order to guide and direct his or her studies and to determine competency. The minimum time required to qualify for an advanced degree varies with the ability and preparation of the student. Students may find it necessary to extend their studies beyond the minimum requirements. For specific minimum residence requirements, students are directed to check the degree program description for the degree which they are pursuing. Students who enter the doctoral degree programs with baccalaureate degrees must spend two academic years in resident study. Students who hold master's degrees when they enter doctoral degree programs must spend one academic year in resident study. One academic year may include two adjacent regular semesters or one regular semester and one adjacent 10-week summer semester.
- University of Wisconsin at Madison – Residency is determined at the department level;
- University of California at Davis – Students working toward a master's degree **must be registered in residence for at least three quarters**. Two regular six-week Summer Sessions may count as the equivalent of one quarter. Usually, all work for the master's degree is done in residence on the Davis campus. With the consent of the graduate adviser and the dean of Graduate Studies, however, some work taken elsewhere may be credited toward your degree. The normal limit for such transfer credit is 6 units from another institution, or 12 concurrent units, or up to one half of the unit requirement if the courses were taken at another campus of the University in graduate status--providing the units were not used to satisfy requirements for another degree.
- University of California at Davis – Students working toward a doctorate **must be registered and in university residence for a minimum of six regular quarters**. Experience indicates that it takes considerably longer than this to complete a degree program. Two consecutive regular Summer Sessions may count as the equivalent of one regular quarter.
- University of California at Davis – Lynda Ciuffetti reported that she could find no reference to distance delivered graduate degrees.
- Cornell – Full-time graduate study at Cornell is measured in terms of registration units. One term of satisfactory, full-time, graduate study normally earns a full registration unit, but the number of courses and the level of performance required are left to the judgment of the members of the student's Special Graduate Committee, consistent with the

requirements, which may be established in the subject areas which they represent. The Graduate School requires six registration units, i.e.: **6 terms of full-time graduate study for the Ph.D. degree.** A Ph.D. student may petition to have study in other graduate schools counted toward the registration unit requirement. Upon recommendation of the special committee and approval of the Dean, a maximum of two registration units may be awarded for a master's degree completed at another university. Requests will not be formally considered until the student is registered in the Graduate School.

- Cornell — The Graduate School requires **four registration units for a M.S. degree.** Master's degree students may not count study in other graduate schools toward the registration unit requirement. They are, however, eligible for registration units for work completed at Cornell in provisional or non-degree status, with the approval of the Special Graduate Committee. **With approval of the Special Graduate Committee students may also earn registration units while registered in-absentia. See the Code of Legislation for further regulations regarding registration units**
- Cornell—Lynda Ciuffetti could not find the “Code of Legislation” on the Cornell web site and did not find anything related to distance delivered education for graduate students.
- Ohio State — A minimum of three out of four consecutive quarters with an enrollment of at least ten graduate credit hours per quarter must be completed while in residence at this University
- Purdue – At least 90 credit hours are required for the PhD, with at least one-third to be earned in continuous residence on the Purdue campus where the degree is to be granted. A master's degree from any accredited university is considered to contribute 30 credit hours toward this 90-hour residency requirement (Lynda Ciuffetti described the process at Purdue known as research in absentia. For more details, please see Section V.F. of the Policies and Procedures for Administering Graduate Programs at <http://www.gradschool.purdue.edu/downloads/facstaff/2004PP.pdf>. Or, see the application form at <http://www.gradschool.purdue.edu/downloads/facstaff/GS-12.rtf>);
- Penn State –There is no required minimum number of credits or semesters of study, but over some twelve-month period during the interval between admission to the Ph.D. program and completion of the Ph.D. program, **the candidate must spend at least two semesters (summer sessions are not included) as a registered full-time student engaged in academic work at the University Park campus, The Milton S. Hershey Medical Center, or Penn State Harrisburg.**
- Colorado State – There is no university residency requirement for PhD programs;
- North Carolina State – NC State offers a range of distance master's degrees with no residency requirement;
- University of Arizona – Arizona offers the master's of engineering degree with no residency requirement; the MS degree in engineering does require residency;
- Michigan State University – MSU offers 9 off-campus master's degree programs with an MS and PhD program in physics offered at a distance with major research laboratories.

Pehrsson explained that the subcommittee looked at a variety of practices at other universities, and she asked the Council to reflect on what it means to earn a PhD at OSU. She noted that this was not the first time such a discussion had come before the Graduate Council. The policy, as it

now reads, has been reviewed many times over the years including a discussion by the Graduate Council in 2001. She indicated that, although we are in a time of change in academia, the matter of PhD learning outcomes is a serious issue. The Council needs to move forward, although with caution.

Steel stated the Graduate Council needs to consult with the university community and may need to seek the support of the Faculty Senate for full approval of any policy changes that the Council may propose.

Pehrsson reminded the Council that it has received a proposal from a department that came forward in an ethical and thoughtful manner. She asked the Council what advice should be given to the department. Pedersen said that the Council made a motion at the last meeting which outlined how we would address the pending request.

Bond stated that articulation of goals is important, but that the real problem is whether an off-site location will enable a student to meet the PhD learning outcomes. She cautioned the Council not to allow the pending Nuclear Engineering proposal to set a precedent. Rather, it should be designed as a very limited test. She stated that the proposal may involve a test for only one or two students; this is too small a sample to validate an alternate process. She reiterated that, with funding, OSU could do the research to determine if PhD learning outcomes could be met at an off-campus location. She would like to see OSU do such a study.

Rockey said that, in his opinion, peer institutions provide artificial comparisons. He is inclined to fully endorse this pilot as an experiment. After a few years, the Council could assess the results and establish revised policy.

Unsworth agreed with Rockey, but cautioned that it might be a long time before results would be known. Pedersen stated that, although quantitative data may not be available for a while, the Council could gather qualitative data along the way. Steel asked if a sunset clause could be imposed on the pilot test. Unsworth maintained that assessment could be undertaken at both the beginning and the end of the students' programs. Pehrsson stated that she would like to see an ongoing report rather than waiting until the end of a trial period. Ciuffetti asked whether the Council should wait to take action on the proposal until the subcommittee has completed its draft concerning doctoral education policy recommendations.

Rettig reminded the Council about pending agenda items for the two Graduate Council meetings that remain this academic year. It may be difficult to schedule time for this issue at the two remaining meetings.

Waldschmidt asked if there is a precedent for approving experimental programs. She said that developing such a policy would allow the Graduate Council to authorize an approved experimental design. Francis stated that there is no such policy, but that the Graduate Council can make exceptions to existing policy.

Bond asked what question the Council should be considering today. Pedersen stated that she believes it is important to get feedback on the research done to date. Unsworth asked when Nuclear Engineering wanted to begin admitting students under their proposed off-campus design. Rettig indicated they have a student who is very interested. The department may see this person as the test case that is motivating their current high interest in a decision from the Council.

Perhsson confirmed that the draft that discusses PhD learning outcomes will be distributed to the Graduate Council in the coming week. She encouraged Council members to provide their feedback via email so that a final draft could be prepared before the May 19 meeting. She stated that the Graduate Council will follow the course of action established by the motion that was approved at its last meeting. Several Council members indicated that they could be available for a summer meeting in the event that a vote was necessary before fall term.

III. Graduate Courses in Plant Physiology

Barbara Bond distributed a draft of a letter expressing concern over the loss of plant physiology courses. She explained that over the past 15 years several plant science faculty have retired or left OSU. In almost all cases, these positions have not been replaced. Consequently, only 2 to 3 of the 15 to 18 courses that were once offered at OSU in the late 1980s are available today. She stated that interdisciplinary programs need fundamental courses in the plant sciences. But there is no incentive for departments to offer these courses. Bond believes it is important for the Graduate Council to go on record acknowledging the problem that exists. She recommended sending the letter to the Provost. She believes a task force could be developed to explore options. Bond suggested that a change in the budget model may be necessary because these are courses that serve multiple programs in multiple departments and no one is taking ownership.

Steel reported that he has been sitting in on a Natural Resources task force, which is comprised of deans. He thought that establishing a similar task force for the plant sciences might be a worthwhile approach. Unsworth questioned whether the Council has gone as far as it can with this issue. He wondered if a meeting with deans and directors of programs that are impacted may be more in order. Francis noted that a formal communication from the Graduate Council to the Provost would get heard. In response to the question of who should be involved, she said that the question is part of a larger issue. It is about how you coordinate courses. You need to get the attention of a broader group of faculty and administrators in order to resolve this issue. She suggested that the Graduate Council send the letter to the Provost and invite him to one of its meetings. She noted that OSU's Strategic Plan states that we want to do these things, but there is nothing in place to make that happen.

Bond indicated that the letter will be drafted as an invitation to the Provost while providing background on the issues.

IV. The New Internet-based TOEFL

Bruce Rettig distributed copies of two power point documents prepared by the Educational Testing Service: one which provides an overview of the iBT/Next Generation TOEFL (Test of English as a Foreign Language); the other about understanding and setting new scores.

Deborah Healey, Director of the English Language Institute, provided a brief background on the TOEFL, indicating that two test versions currently exist:

1. a paper-based test (PBT) which is a multiple choice test. This test is used by ELI as one instrument to evaluate conditionally admitted students.
2. a computer-based test (CBT) which includes a writing section.

Healey explained that the iBT, the newest version of the TOEFL, is similar to the IELTS (International English Language Testing System). Although the IELTS is superior to the current PBT and CBT, is not as widely available as the TOEFL. The iBT includes both writing and speaking sections. The test includes a computer-generated score for writing and a human score for the speaking component. She believes it is a better test because it includes multiple skills and the questions on the test are integrated.

The iBT will be administered beginning in the United States in September 2005, followed by administration in October in a few other countries including Canada, France and Germany. However, Healey anticipates a long delay in getting the iBT to India and Africa. CBT will continue to be the dominant test version for the immediate future. Unlike the CBT which is available on an ongoing basis, the iBT will be offered only on specific testing dates. The ELI has applied to become an iBT testing site.

Healey indicated the speaking section of the iBT will be different from the Test of Spoken English (TSE) or the SPEAK test which is currently administered to international GTAs. She indicated that iBT will measure how well an individual may function in the university lecture environment.

Healey suggested that OSU needs to be prepared to receive scores from European sites as early as October 2005. She recommends the Graduate Council consider establishing minimum scores in each of the skills areas: reading, listening, speaking, and writing. Healey stated that setting interim scores initially would allow OSU to be prepared for the new test method.

Ciuffetti asked if ETS was considering eliminating the SPEAK test. She expressed her concern for GTA spoken language proficiency. Healey said that ETS will not be eliminating the SPEAK test and will be interested in receiving feedback from universities about their testing needs.

Steel questioned how the iBT correlates to the verbal GRE score. Healey explained that the TOEFL was built for non-native speakers and is a better measure of language proficiency for international students. The GRE verbal exam is designed to test students whose native language is English.

Francis noted that the task for the Graduate Council is to set admissions standards for the TOEFL test.

Healey stated that a benefit from the new test will be that more students will be preparing for the speaking portion of the test and subsequently will be building their spoken language skills.

Rettig said it would be optimal if, by early September, the Admissions Office web site gave guidance on the new iBT. He suggested creating a task group this summer to set up initial score thresholds. While some ball-park numbers may be close enough for the overall score, the sub scores will be critical in assessing language proficiency for incoming students.

Bond suggested adding this item to the agenda for the proposed summer meeting. She recalls the Council coming to an agreement when the IELTS was reviewed. She recommends that Healey prepare a recommendation for Graduate Council consideration. Healey indicated that she would like to collaborate with colleges to listen to the tapes and look at writing samples to determine the minimum score thresholds. Francis asked if Healey could bring such samples to the Graduate Council and guide them through the process of developing minimum score requirements.

Unsworth expressed interest in receiving the recommendation from the experts in language testing. Bond asked that any future presentation be brief but effective enough to inform the Council so that they could make informed decisions.

Rettig sought clarification about what quorum would be required during a summer meeting to take action. He suggested that the quorum consist of those who are present.

V. Other Business

- Lynda Ciuffetti proposed that the Graduate Council gather at Bombs Away Café after its June 2 meeting as a way of acknowledging the hard work of the Council and the departure of several members.
- Rettig asked the Council for the manner in which minutes from the June 2 meeting will be approved. It was determined that the minutes would be distributed electronically for a vote.
- Rettig asked the Council how it wishes to handle Category II requests that are received during the summer months. He asked current Category II subcommittee members to let him know if they could manage the process in the manner that was undertaken last summer.

GRADUATE COUNCIL MEETING

April 21, 2005

3:00pm, MU Board Room

Present: Pehrsson (co-chair), Steel (co-chair), Bond, Brown, Ciuffetti, Filtz, Francis, Koenig, Pedersen, Rettig, Rockey, Strickroth, Unsworth, Waldschmidt

Absent: Selker, Tadepalli

Guests: Tammy Bray, Tony Wilcox

I. Approval of Minutes

The minutes from the April 7, 2005 meeting were reviewed by Council members. Elaine Pedersen (Health and Human Sciences) asked that the spelling of her last name be corrected throughout the document. Eileen Waldschmidt (Graduate Admissions Committee) and Mike Unsworth (Oceanic and Atmospheric Sciences) noted that they were present, not absent at the last meeting. The minutes were approved as amended.

II. PhD Learning Outcomes

What are the essential components for the making of a compelling PhD learning experience? A list of discussion questions (Appendix 1) were developed by Dale Pehrsson (Education) and distributed to Council members for their consideration. Pehrsson opened the topic for general discussion.

Theresa Filtz (Pharmacy) asked for clarification: What does the Council wish to achieve by discussing outcomes? Does it plan to establish requirements for university-level learning outcomes for graduate programs? Bruce Rettig (Graduate School) provided background and indicated that the momentum stems largely from last year's Council action to accept 27 rather than 36 OSU didactic course credits for the Chemistry PhD degree. He reminded the Council that at the time of the Chemistry request, Barbara Bond (Forestry) had asked the Chemistry Department to link the request for 27 course credits to outcomes and assessment of outcomes.

To help inform the Council on outcomes, Rettig had recommended several articles about the doctorate (e.g. Carnegie, LaPidus) for the Council. These articles provide an array of outcomes in addition to that of producing a dissertation. Hence, the current discussion can be viewed as a fundamental philosophical discussion underlying the Council's consideration of various policies such as residency, the requirement of 36 regular course credits, the minimum of one year devoted to the dissertation, the oral preliminary examination, and the number of transfer credits permitted; all of these regulations are related to what one considers the doctor of philosophy degree to be all about. He indicated that the Council has options in the approach they wish to take. They could come up with general principles or they could think in terms of specific regulations that currently exist, such as residency, the minimum number of program credits, etc. Rettig stated that the background questions are meant to provide set-up for these discussions; it is

up to the Council to determine how this discussion may impact policy decisions. Pehrsson pointed to the need to be well informed as policies are considered, especially as the world is changing at a rapid pace.

Filtz stated that a list of identifiable core outcomes would be beneficial. Yet she does not feel she lacks a sufficiently broad background to develop core outcomes for the entire university. She sees the need for program requirements to be tied to outcomes and indicated that she thinks that the larger policies that have been considered by the Council have been without a framework; this discussion could provide this needed framework.

Pehrsson referred Council members to a document found on the Pennsylvania State University web site document on residency and related policies for off-campus graduate programs. (This document is found online at <http://www.gradsch.psu.edu/policies/faculty/offcampus.html>) Lynda Ciuffetti (Science) indicated that the Penn State document was helpful relative to the Council's pending deliberations on off-campus programs. Ciuffetti noted that the Penn State document made a distinction between the PhD and professional doctorate programs. The document reflects many of her perspectives on doctoral education. She also said Pehrsson's list of questions reinforces her views and stated that she does not see how an off-campus PhD program would be able to respond adequately to the list of questions articulated by Pehrsson.

Rettig noted that the current version of the Graduate Council Program Review Guidelines also emphasizes outcomes assessment and asks units providing graduate programs to identify the outcomes. The growing emphasis on identification of outcomes and accountability in graduate programming is seen in the emphasis placed in university accreditation processes and is consistent with the increasing requirements for accountability in the K-12 school system. Within graduate education, the issues are: What are the needs of your students? And, are you meeting them?

Brent Steel (Liberal Arts) pointed to pages 28-30 of a policy statement of the Council of Graduate Schools dealing with residency. (This document is found online at <http://www.cgsnet.org/pdf/DistanceGraduateEducation.pdf>). The language in the CGS policy statement bears on the Council's third agenda item (the proposal from Nuclear Engineering for a process related to their distance-delivered PhD program).

Ciuffetti questioned the Graduate Council's independence in making decisions on this issue without seeking adequate liaison. When a previous issue lacked adequate liaison, the Faculty Senate required involvement by the Curriculum Council and a presentation to the full Faculty Senate. The Faculty Senate may want to be involved in decisions about this policy issue as well.

Sally Francis (Graduate School) reported having consulted with Provost Sabah Randhawa and Vice-Provost Rebecca Johnson. The Provost indicated that he would be unsupportive of a case-by-case approach to alternative delivery sites for graduate programs, specifically Nuclear Engineering. Both Randhawa and Johnson agreed that OUS' concern about alternate sites is largely relevant to sites within the boundaries of Oregon. While they indicated the Graduate Council could make decisions about alternate sites, Francis said the Provost would not condone a

case-by-case approach. Even so, Francis indicated that she could envision a pilot case for a given student to be used as a test case.

Hal Koenig (Business) reported that in the recent graduate program review in Statistics, he became aware of a student who could not find a PhD advisor at OSU and had to leave the program. He sees the NE proposal in a similar light. The remote site would provide the facilities and equipment, but if a mentor cannot be identified, then Nuclear Engineering might find itself in the same situation as is often found in Statistics. Bond argued that Nuclear Engineering would be treated no differently than any other department that may be interested in deviating from the standard residency requirement.

Unsworth said that, if the Graduate Council had a policy with clearly stated criteria, individual cases could be judged against the policy and criteria.

Steel suggested reviewing the Penn State policy statement and developing an OSU policy would be most helpful. He reported on a conversation with the Distance Education program at the University of Florida where four distance doctoral programs are offered. The two distance-delivered PhD programs require completion of the standard university residency requirement while attending intensive summer sessions to meet the spirit of residency. The two distance-delivered professional doctorates (Doctor of Audiology and Doctor of Pharmacy) are delivered at regional sites rather than Gainesville, but do create a community of scholars consisting of both faculty and students.

Bond said that Graduate Council lacks the information it needs to make an informed decision. Too much of the conversation is relying on hunches rather than scientifically validated relationships between specific requirements and desired outcomes. In addition to answering Pehrsson's questions, the Council needs research on what strategies would lead to the outcomes. Pehrsson stated that the burden of demonstrating how outcomes are met should be on the unit that proposes to not comply with current residence requirements. Nuclear Engineering should be required to tell the Graduate Council what they will do in the next three years to validate the approach they wish to pursue. This approach (requiring a process to assess how their proposal would provide the learning outcomes normally generated by residency) will prevent setting a precedent. Any other unit offering a proposal to deviate from the standard residency requirement would also be required to show evidence of how outcomes would be met. In addition, Bond asserted that Nuclear Engineering should be financially responsible to fund a study of their "test case," providing external validation rather than relying only on an internal validation process.

Steel proposed establishing a subcommittee to develop a draft policy on outcomes for the Graduate Council to discuss at a future meeting. Steel, Pehrsson, Ciuffetti, Unsworth, and Dan Rocky (Veterinary Medicine) volunteered to serve on this subcommittee.

Elaine Pedersen (Health and Human Sciences) suggested that the Nuclear Engineering proposal be made the test case. Rocky supported this idea. Bond reasserted that the department or the Provost should fund an independent external study to prove the validity of the approach.

III. Nuclear Engineering Request for an Exception for Doctoral Residency Requirements

Barbara Bond made a motion as follows:

- The Graduate Council ad hoc subcommittee will draft outcomes concerning doctoral education and policy recommendations;
- After review of the draft by the full Council, the Graduate Council will send it to Nuclear Engineering;
- Nuclear Engineering must then report back to the Graduate Council with a plan specifying how their proposal will address the policy recommendations and outcomes;
- A plan for an independent study of the relationship between the program requirements and hoped for outcomes will be developed by NE;
- After all the above are met, the Graduate Council will respond to Nuclear Engineering's specific request.

The motion approved unanimously.

IV. Category I Proposal to Create a Department of Nutrition and Exercise Science

Tony Wilcox, chair of both the Department of Exercise and Sport Science and the Department of Food and Nutrition, gave a brief summary of the Category I proposal to create a department of Nutrition and Exercise Science by merging the two departments he is currently chairing. He stated that 2004-05 has been a "trial" year during which the two departments have operated as a merged unit. Both programs are in stages of growth. This presents an opportunity to bridge the two departments in ways that will guide their future faculty hires—in fact, they are already hiring in the direction of supporting a merged unit. Many students who apply to one area will have as a support area the other discipline. They have large undergraduate enrollment and a reasonably large graduate population. They have an initiative in laboratory facilities development to consolidate cellular and molecular research from both programs. While the idea to merge was presented initially at the administrative level, there has been a good level of faculty engagement and support. The merger is an opportunity to address new, important health questions and to develop curriculum together and build courses that will bridge the two former departments' foci and missions.

Ciuffetti asked if any faculty oppose the merger. Wilcox said no minority position has been presented. He reported that the Budgets and Fiscal Planning Committee recently approved the proposal and that the transmittal bears the former NFM Department Chair's (Melinda Manore) signature. Budgets and Fiscal Planning also wanted to see a liaison letter from the College of Agricultural Sciences and the Extension Service. Tammy Bray, Dean of Health and Human Sciences, reported that the leadership in both of those units have given verbal support and that their liaison letters will be forthcoming.

Bray said that on the nutrition and food management side, the faculty numbers have been decreasing. Faculty members who have retired from this department have not been replaced

while waiting for the strategic plans of the University and the recently merged College to become more apparent. The two departments have decided to take a more holistic, lifestyle approach as opposed to the previous emphasis on the study of specific micronutrients. All new hires will be based on this evolving emphasis which includes:

- Fitness and nutrition,
- Athletic training and dietetics, and
- Pre (Allied) health sciences

OSU's dietetics program, which is an undergraduate program, will have a unique emphasis on preventive health and community nutrition. Wilcox indicated that their intent is to expand dietetics to the master's level.

Wilcox said they intend to create a dietetics management internship, which will tap into their extension specialist and be complementary to OHSU.

Unsworth asked what implications the merger may have on the graduate programs. Wilcox indicated that they will continue to offer existing NFM and EXSS masters and doctoral degrees. There is no proposed immediate merger of the current graduate majors, but both will evolve, particularly with new faculty hires. Bray indicated that at the point of the merger, they saw the connections between exercise, bone density, and aging—these are complementary areas of graduate study and research.

Bond spoke of her experiences with graduate program reviews in which departments have merged. She reported that separate physical locations of faculty and students create a barrier to true integration. She asked what plans are in place to physically integrate the faculty. Wilcox stated that the two departments are now spread among three buildings but that there is a plan to move the department office from Langton Hall, where leadership of Exercise and Sport Science has been housed, to Milam Hall, where Nutrition and Food Management has been located. It is important for the purpose of integration that the chair's office be located in Milam. In addition, the location of laboratories will be important—the organizing principle is around research needs. One EXSS faculty member has already moved to Milam Hall. Further, new laboratories will be designed with an open approach (accessible to multiple faculty members) to facilitate integration and cooperation. Generally, the bio-human laboratories will be in Langton and the chemical laboratories will be in Milam. Bray reiterated that Wilcox has been doing a very good job of mixing/moving people already.

Filtz asked about the absence reference to a graduate admissions or program committee within the proposal. Wilcox stated that they have identified a graduate coordinator position. However, in the past, both departments worked without such a committee. They do have separate faculty meetings of the graduate faculty. And they are developing a single, combined graduate handbook for both programs which will create action items for the faculty to discuss. Unsworth asked again about the absence of a formal graduate admission committee for the purpose of overall coordination. He thinks a more formal structure would be appropriate. Wilcox stated that he does not see their current practice in this regard as having any deficiencies.

Bond followed up by noting that the Graduate Council has been asking departments during program reviews to articulate their competencies, expectations, and outcomes. She said that as the new unit is forming, the entire faculty should get together to discuss these issues.

After the guests departed, Rettig informed the Graduate Council that the Budgets and Fiscal Planning Committee report indicating approval of the proposal is available and that he could get that to the Council if they would like to have it before they act. He indicated that Wilcox had highlighted the report's recommendations within his comments to the Council

Bond made a motion to accept the Category I proposal for the creation of a Department of Nutrition and Exercise Science. The motion was seconded by Unsworth and passed unanimously.

Appendix 1
What are the essential components for the making of a compelling PhD learning experience?
Questions to ponder

**Dale E. Pehrsson
Graduate Council
April 7, 2005**

- Are these individuals pursuing a PhD prepared to contribute to and expand the knowledge of their discipline(s)?
- Are these PhD individuals ready to be stewards of their unique profession?
- Are these PhD individuals ready to function as emerging scholars and researchers?
- Do these PhD individuals have the tools and skills necessary to conduct research?
- Can these PhD individuals function independently conducting research and obtain funding?
- Do these PhD individuals have what it takes to teach, advise, mentor and plan curriculum?
- Have these PhD individuals earned the “terminal” preparation essential for their career?
- Do these PhD individuals possess the skills for life long learning?
- Have these PhD individuals formulated their professional identity?
- How does the discipline/department/program provide experiences for fostering the development of professional identity?
- Do these PhD individuals engage inter, intra and independently with other professionals?
- Can these PhD individuals perform collaboratively?
- Does the PhD individual have a sense, working understanding and ability to contribute to global issues?
- Do these PhD individuals have needed skills for interdisciplinary work and contributions?
- Do we know what makes the PhD from OSU unique?
- Are these PhD individuals prepared for professional practice?
- Are these PhD individuals prepared for faculty positions?
- Are these PhD individuals prepared for industry?
- Do we trust our colleagues and disciplinary experts to decide what is needed?
- Do we know the desired outcomes and if so... what is the best course of action or structure needed to insure a quality PhD preparation and experience?
- Do we, individually and as a council, clearly understand and can we articulate what is important and necessary for the OSU PhD experience?

GRADUATE COUNCIL MEETING

April 7, 2005

3:00pm, MU Board Room

Present: Pehrsson (co-chair), Steel (co-chair), Ciuffetti, Filtz, Francis, Koenig, Pedersen, Rettig, Rockey, Strickroth, Tadepalli, Unsworth, Waldschmidt

Absent: Bond, Brown, Selker

Guests: Kathryn Higley, José Reyes

I. Approval of Minutes

The minutes from March 17, 2005, were approved as written.

II. Test of a Distance Delivered Doctoral Program

José Reyes and Kathryn Higley (Department of Nuclear Engineering and Radiation Health Physics) introduced a proposal for a test case for a distance delivered PhD program. The proposal as presented in advance of the meeting was summarized as follows.

The Department of Nuclear Engineering and Radiation Health Physics in the College of Engineering is seeking Graduate Council approval of its off-campus site approval process to conduct a test sampling of its distance delivered doctoral program for up to 3 candidates. The off-campus site approval process, in conjunction with department requirements on student qualifications, graded coursework and research, is designed to provide a residency experience that meets, and in some cases exceeds, that for on-campus students. The NE/RHP distance delivered PhD program is specifically designed for professionals unable to spend at least three terms of full-time graduate academic work on campus.

The residence requirements for students enrolled in a distance delivered NE/RHP PhD program will be met by:

1. Completing a minimum of 36 graduate OSU credits, and
2. Either spending at least 3 terms of full-time graduate work on campus, or the successful implementation of the NE/RHP off-campus site approval process and department requirements for student qualifications, graded coursework and research.

Off-Campus Site Approval

The Department of Nuclear Engineering and Radiation Health Physics will use appropriate means to assure that:

1. The student's agency or firm contains appropriate research facilities at the student's place of employment. (Research and library access facilities).
2. All department requirements for distance delivered PhD programs are met.
3. That a preceptor has been selected based on academic and professional achievement.

This will require an agreement with the student's agency/firm, may include a stipend, and would require status as adjunct faculty within NE/RHP.

4. Intensive on-campus meetings in Corvallis – such as regular graduate committee presentations, candidacy exams, and research presentations - would be scheduled.

(Footnote to item 3: A preceptor is an expert or a specialist in the field of study who both gives practical experience and training to a student and monitors, as an extension of the Department, the progress and activity of the student on-site. Preceptors will be provided with training and support for their roles in the program.)

NE/RHP Requirements for Distance Delivered PhD Programs

A. Student Qualifications

Students considered for acceptance into our NE/RHP distance delivered doctoral program must meet the following criteria:

1. They must meet all screening criteria for on-campus candidates.
2. They must be working professionals in the technical field of health physics, nuclear engineering, or a closely related discipline such as medical physics.
3. They must have a minimum of 5 years in the position related to the degree.
4. Their firm or agency must concur in writing with their request to participate in the program.

B. Graded Coursework

Students in the NE/RHP distance delivered PhD program will take coursework using the following delivery method, where required:

1. Didactic: Via E-Learning with concentrated regional meetings
2. Coursework will be provided/supported both via internet and interactive video.
3. Laboratory course experience: Either on-campus or at their site (using facilities of the agency/firm by agreement).
4. Preceptor: Same

C. Research

Research for the PhD dissertation would:

1. Meet all academic criteria for on-campus students
 - a. Students would have to pass the PhD qualifying exams which are offered on-campus
 - b. Students would have to pass the PhD candidacy exam where they make an oral presentation of their proposed research
 - c. Students would have to pass the final defense.
 - d. All of these exams would be held at OSU on-campus.
2. Be limited to dissertation/research topic which are related to the student's current field of work and have a thematic match to the expertise of their OSU faculty advisor.

3. Require electronic access to research materials be available
4. Require that a OSU library liaison be identified
5. Require a preceptor: Same as above
6. Require a Faculty Advisor:
 - a. Available via comtech – scheduled/unscheduled
 - b. Scheduled face-to-face meetings on Campus
7. Require approval based on their potential contribution to the field.

D. Residency

Satisfied in accordance with the NE/RHP off-campus site approval process as approved by the Graduate Council.

Lynda Ciuffetti (Science) asked whether the students in this program would comply with the continuous registration requirement. Bruce Rettig (Graduate School) noted that the students could apply for leave of absence when they are not using university resources. When the students work with OSU faculty or use technology resources such as distance access to electronic journals or other publications, they would be required to register for a minimum of three credits. Reyes observed that the OSU library distance resources are very good and include journals helpful to students in Nuclear Engineering and Radiation Health Physics.

Sally Francis (Graduate School) asked for more information about the preceptor. Reyes and Higley explained that this was a local technical advisor—someone supports OSU Nuclear Engineering faculty. OSU faculty members would serve as major professors and other members of the student’s advisory committee. The preceptor would be oriented to “OSU culture,” including departmental and university requirements during the site visit.

In response to questions about costs, Reyes noted that costs of the site visit would come from revenue collected from the student. Higley added that OSU would not have to pay a stipend or pay for research expenses since the student’s employer would provide these.

Francis asked whether approval of a site for one student would mean approval for another student. Higley explained that the approval process is both site and student specific. If another student applied from the same site, another site visit would be required. Likewise, if a student changed locations, the student would be considered to have withdrawn from the program. If that student wished to resume study at another location, the entire screening and site visit process would be needed.

Reyes noted that many of the questions posed by Council members appeared to interpret their proposal to be a request for a change in the residency requirement. He said that the request was for a limited test to determine whether the proposed educational experience is consistent with both general OSU expectations and expectations of his department.

Francis asked whether the proposed educational experience should be a professional doctorate rather than a PhD. What is a PhD? Can the experience be provided at a distant location? Reyes said that the prospective students wish to gain the full PhD experience including becoming qualified to be independent researchers.

Ciuffetti asked whether the focus of discussion could shift from its value for faculty to its value for students. In particular, she was concerned about potential conflicts of interest. If the student receives signals that the work should contribute to the needs of the company or agency providing the resources for the site, the research may not meet the standards for scholarly, independent research. Reyes responded that Nuclear Engineering was ranked highly in the recent U.S. News and World Report ranking and that the department would not want to jeopardize the respect that it has earned for itself and the university. Brent Steel (Liberal Arts) noted that being located in Corvallis does not eliminate conflicts of interest. He is aware of current OSU graduate students whose research is monitored closely by agencies and firms sponsoring the research.

Prasad Tadepalli (Engineering) asked whether the student would be free to publish the work openly. Reyes said that this would be a requirement. The student would be required to submit the thesis to the library and to the national repositories just like any other OSU dissertation.

Elaine Pedersen (Health and Human Sciences) asked whether, since this was to be a test, someone was working on an appropriate experimental design to assess whether the test was a success. Steel agreed that experimental design is essential to calling this a true test.

Pedersen noted that distance education is a rapidly expanding enterprise. If there is a need for distance delivered doctoral programs such as the one being proposed by Nuclear Engineering, and if OSU does not address the need, we should anticipate someone else doing so.

Steel explained that he has much experience teaching courses similar to those offered by Nuclear Engineering. His questions are whether the proposal needs to more clearly specify (1) the role of the various involved parties and (2) strategies for avoiding conflicts of interest. Ciuffetti agrees that conflicts of interest, which might arise when a student's employer is paying for the doctoral education, is important. Related issues are those of intellectual property: Are there limits on a student's right to publish and to secure patents? She continues to have concerns about assessment of the process.

Pehrsson believes that the faculty who are engaged are ethical and passionate about their degree program, including this proposed approach. They should be able to succeed. Perhaps a partnership with the Graduate Council would be a way to assess the success of the program and identify questions that need to be resolved as they arise. She does not advocate delaying the test.

Ciuffetti asked whether the approval process for this proposal should include others besides the Graduate Council. Steel suggested that having Council members seek advice from their colleges would be helpful. Francis said that, if the proposal is intended to identify alternative sites, it might need approval from OUS. She is aware of processes for delivering a program to a new site in Oregon, but does not have guidance about delivery outside the state.

Pehrsson asked whether this is a proposal for delivering a degree to a new site or a proposal for allowing dissertation research to be conducted off site. Other council members believed that it was a proposal for conducting research away from Corvallis by a student who completes courses delivered through distance technology.

Hal Koenig (Business) suggested involvement in seminars by using new and emerging audio/video technology. Steel asked whether, given rapid strides in communication capabilities

using interactive audio and video, requiring the use of such technology would alleviate concerns some Council members have. Ciuffetti argued that other issues are involved. One missing factor is the sense of community that is generated when a student interacts with other students and faculty. PhD education is a time of professional growth and adjustment to a life as a scholar.

Koenig asked whether Reyes or Higley should be given a set of questions related to concerns raised by Council members.

Francis noted that the employer may be paying the student's tuition bill. How does this affect the intellectual property right? Is this clarified in the agreement reached between the student, the employer and OSU? Is the student at risk? What is the student's right to publish? Who is allowed to patent technology? Who looks out for OSU? Francis suggested that advice from legal counsel would be helpful on these issues.

III. Category I Proposal to Eliminate Graduate Degrees in Plant Physiology

The Council continued its discussion of the proposal to eliminate the graduate degree programs in plant physiology. Some Council members had talked with Barbara Bond (Forestry) and others had read the following summary of correspondence between Dale Pehrsson (Education) and Bond on this issue.

Summary of discussion and follow up with Barbara Bond

Two years ago Barbara wrote a memorandum to deans of Ag, Forestry and Science and also the grad school (Sally Francis) advising them that the university was seriously "leaking" instructors in plant phys and it was starting to have a serious impact on programs (See earlier memo from Barbara Bond).

Sally asked Barbara to chair a committee to investigate. The committee met over about 6 months and then submitted a report to Sally and other deans (Barbara can send you the full report if you'd like to see it). In brief, the report recommended:

- abolishment of the Plant Physiology interdisciplinary program (reasons are given in the report), and
- development of a faculty of plant biology that would develop a new approach to collaborative teaching plant physiology courses. (The report proposes development of a "modular" approach to teaching courses to maximize contributions of current faculty).

Sally then asked Barbara (about a year ago) to work with Charles Boyer to pursue these two recommendations:

- The Category I proposal that the Grad Council discussed at their last meeting was one outcome
- The other recommendation (establishment of a Plant Biology faculty and a new, collaborative approach to offering courses) is still unresolved. Faculty and admin were busy and unable to devote much time to this, and at the same time a group of

Department Heads from Hort, Botany, Crop Sci, and For Sci organized to develop a new graduate program in Plant Science. (Dan Arp of Botany and Plant Pathology is leading this effort) Their plan is designed to meet many the same needs Barbara identified originally, although there are some differences in approach. For example, Plant Science strategy (as currently formulated) would create an entirely new graduate program; it calls for new graduate degrees in Plant Science that would replace graduate programs involving the plant sciences that currently reside in departments.

Barbara is not involved in this new effort but supports the idea of graduate programs that are completely interdepartmental, although it is a very ambitious strategy that will probably take quite a bit of time to develop and implement.

- A simple bottom line: the Plant Phys grad program has only graduated a handful of students in its 15 or more years of existence (I was one of them), and more than 75% of the courses required by the program are no longer taught. It is no longer honest or realistic for OSU to maintain the program.

Barbara regrets very much that she will miss the next Council meeting. She recommends voting in favor of the Category I proposal to eliminate the Interdisciplinary Program in Plant Physiology. She also recommends that the Council consider issuing a public statement of concern about the status of graduate courses in plant biology at OSU.

Dan Rockey (Veterinary Medicine) noted that discussions are taking place about a redesign of Molecular and Cellular Biology (MCB) with specializations within the degree umbrella. Will efforts to improve course availability through the MCB redesign address some concerns? Ciuffetti said that MCB covers issues other than plant physiology and that important parts of plant physiology fall outside MCB. She concurred with the need to raise concern about plant physiology courses, but recommended that the Council approve the Category I proposal.

The Council unanimously approved the Category I proposal to eliminate plant physiology.

A proposal was made to create a group of Council members consisting of Bond, Ciuffetti, Selker and Unsworth to draft a statement of concern about the loss of critical courses. The statement will be brought to the full Council for discussion. Upon approval, the statement will be distributed to the academic deans with plant science programs and to the Provost. Pehrsson agreed to communicate this request to Bond, Selker and Unsworth.

IV. Other Business

Koenig asked for advice on writing the Statistics Graduate Program Review Report. He said that Statistics faculty members teach many service courses (courses designed primarily to meet the needs of students majoring in degrees other than Statistics). Many students who take these courses ask Statistics faculty to serve as minor professors. The large number of commitments as minor professor is a heavy work commitment with little formal recognition for the faculty member or the department. In addition, faculty members advise several Statistics graduate students. They provide large amounts of statistical consulting services, much of it without compensation or formal recognition. Should the review report include a recommendation that Statistics faculty decline some of the requests for consulting advice and service as minor

professors so that the faculty can spend more time on scholarly inquiry and their own research programs?

Council members agreed that the issue was an appropriate one to discuss. The review committee should feel free to provide any recommendations that may lead to improvement in the graduate education of Statistics students and to enhancement of the faculty members' research programs.

GRADUATE COUNCIL MEETING

March 17, 2005

3:00pm, MU Board Room

Present: Pehrsson (co-chair), Steel (co-chair), Filtz, Francis, Koenig, Pederson, Rettig, Rockey, Selker, Strickroth, Tadeballi, Unsworth, Waldschmidt

Absent: Bond, Brown, Ciuffetti

Guests: Charles Boyer, Sam Stern

I. Approval of Minutes

The minutes from March 3, 2005, were approved as written.

II. Category I Proposal to Reorganize the School of Education

Sam Stern, Dean of the School of Education presented a proposal to reorganize the School of Education into three departments and change the designation of the unit from the School of Education to the College of Education (see Appendix 1).

The proposal to reorganize the School of Education was approved by the Council

III. Category I Proposal to Eliminate Graduate Degrees in Plant Physiology

Charles Boyer, Associate Dean of the College of Agricultural Sciences presented a proposal to eliminate the MS and PhD degrees in Plant Physiology (see Appendix 2). Although courses in plant physiology are of great value to several academic programs at Oregon State University, this particular interdisciplinary graduate program has not been effective for a long time. Since the retirement of Pat Breen, efforts to find a leader for the program have been unsuccessful. Numbers of students wishing to elect this degree have declined over time as well. Faculty members holding graduate faculty status in Plant Physiology and students currently finishing the degree have been contacted. No objections to termination have been raised.

Bruce Rettig (Graduate School) asked whether inactive students would be allowed to readmit and complete their degree programs. Boyer said that this would be allowed if the core courses have been completed. He is aware of only one former student in this position and agreed to work with that student to allow a timely completion.

John Selker (Agricultural Sciences) and Michael Unsworth (Oceanic and Atmospheric Sciences) expressed deep concern about the declining availability of plant physiology courses. They argued that these courses are critical to initiatives in biological sciences at Oregon State University. Both would prefer to delay action on this proposal until a plan for providing the necessary courses has been put forward. Selker argued that it is easier to draft a proposal for a name change or modification to a current degree program than to develop a course proposal for a new degree.

Boyer and Sally Francis (Graduate School) agreed to the value of the courses, but argued that the plant physiology degree program is not contributing to the efforts to address this concern, which are described in Attachments 1 and 2 to Appendix 2 (the Category I proposal).

Theresa Filtz reminded the Council that one of the three study groups identified by the Council was studying service courses. Does this issue fall within the purview of that group?

Dale Pehrsson (Education) and Brent Steel (Liberal Arts) asked whether Council members would prefer to delay action on the proposal until Barbara Bond (Forestry), who is both a Graduate Council member and a member of the group studying alternatives for providing plant science courses is available. If Bond recommends that others, such as additional members of the study group and deans of Science, Forestry, and Agricultural Sciences attend, they will be invited. The Council agreed to this action.

IV. Clarification of the Graduate Council Decision on 700-level Courses

On March 3, the Council approved the following motion: “

The Council approved a motion that 700 level courses that successfully go through the category II proposal process be accepted as graduate level for programs of study.”

Rettig asked for help in interpreting this motion. Specifically, he cited areas of the graduate catalog that might need adjustment, depending on how the Council’s motion is implemented. First, current policy specifies that only graduate credits may be transferred. If a student completes the Pharm D degree and then wishes to use some of those credits toward a graduate degree, how would this be interpreted relative to the 3/3/05 motion? Second, 700-level courses are now defined as not permitted for use as graduate credits. This might need revision; the Graduate School is unclear whether this definition is based at OSU or whether it is OUS derived. Also, it is unclear that the Graduate Council has the authority to redefine 700-level course descriptions. Third, residency requirements relate to graduate courses. Should 700-level credits be allowed to satisfy residency? Fourth, the current degree requirements require that half of the credits on a program of study be “graduate standalone” and the remainder “graduate standalone or the 500-component of slash courses.” How should 700-level courses be counted in interpreting this “50% rule”?

Filtz argued that formal approval of 700-level courses as meeting graduate standing by all levels of approval in the Category II proposal process would justify the treatment of such courses as graduate standalone. Filtz also indicated that the Pharmacy students in question are likely to enter joint D Pharm and PhD studies holding a previous bachelor’s degree. She agreed that, if any students were to take the 700-level courses while enrolled as an undergraduate and use those courses to satisfy bachelor’s degree requirements, they could not be used on a graduate program of study.

Francis said that she may need to seek the advice of the Provost on whether the Graduate Council has sole authority on these issues or whether others should be involved.

Filtz asked for quick action because the College of Pharmacy is recruiting students and the ability to use some credits for both the D Pharm and the PhD may be critical to some students as they decide whether to come to OSU.

The Council agreed to not amend its motion of March 3, 2005. This issue will not come back to the Graduate Council agenda unless necessary after additional information is acquired.

V. PhD Learning Outcomes and PhD Degree Requirements

A group of Graduate Council members has been studying material (including an essay by Jules LaPidus) on expected outcomes of a PhD education. (See <http://www.cgsnet.org/pdf/doctoraledpreparing.pdf>). Among the arguments made by LaPidus that resonated with Council members were the following:

“The ability to successfully carry out an independent research project has long been thought of as the primary, and perhaps the sole criterion for obtaining a Ph.D. With few exceptions, however, employers of Ph.D.s assert that this is not the only thing they are looking for, and that opportunities to function as an independent investigator are increasingly limited.”

“Increasingly, candidates for academic employment are being asked about their teaching experience and about their views on education, and some institutions (particularly liberal arts colleges or community colleges) may ask candidates to present a lecture rather than give a research seminar.”

The Council discussed these and other insights, including the focus on scholarship as opposed to research and the ideal of providing stewardship for disciplines. They agreed to keep these thoughts in mind as they review a proposal before the Council to allow an exception for PhD residency in one program and to review other requests that may come before the Council this year.

Appendix 1

Proposal Title: Education Unit Name Change and Departmental Reorganization

Name of Institution: Oregon State University

Name of Proposing College or School: School of Education

Name of Proposing Department(s) or Program(s): not applicable

CIP Number from the Office of Institutional Research: 13.0101

Date of Proposal: February 4, 2005

Proposed Effective Date or Term: Winter Term; Immediately following Board Approval

1. **Title of the proposed instructional, research, or public service unit. For name changes, give both the current and proposed names. Describe the reason(s) for the proposed change.**

In February 2002, the Oregon State Board of Higher Education unanimously approved the reestablishment of the School of Education at Oregon State University as a separate entity after nearly a decade as part of the College of Home Economics and Education. Also in 2002, a new College of Health and Human Sciences (HHS) was created that included departments in the former College of Home Economics and Education other than education and 4-H. The proposal for the creation of HHS (http://oregonstate.edu/ap/curriculum/cat1sweb/HHP_final.htm) specifically indicated that a separate Category I proposal related to the School of Education and Department of 4-H Youth Development would be submitted later.

As part of the College of Home Economics and Education from 1992 to 2002, the School of Education functioned very much like a large department with a number of different program areas (i.e. adult education, community college leadership, counseling education, elementary education, family and consumer science education, and professional technical education).

When the School of Education was reestablished as a separate unit in the spring of 2002, the Department of 4-H Youth Development (formerly in the College of Home Economics and Education) and the College Student Services Administration program (formerly in the Graduate School) were added to the School of Education. During the first year of operation as a new School of Education (2002-2003), it became clear that an organizational structure made up of many small programs was inefficient and served as a barrier to interdisciplinary and collaborative activity. Therefore, through deliberations with faculty, staff, and stakeholders, a new organizational structure with three major departments was developed.

Department of Teacher and Counselor Education (includes program areas in teacher and counselor education)

- Education Double Degree BA/BS
- Master of Arts in Teaching MAT
- Master of Education, EdM
- Doctorate of Education, EdD/PhD
- Doctorate of Counseling, PhD

Department of Adult Education and Higher Education Leadership (includes the

program areas of adult education, college student services administration, and community college leadership)

- Adult Education, EdM
- College Student Services Administration, EdM/MS
- Community College Leadership, EdD/PhD

Department of 4-H Youth Development Education (an existing department, formerly in the College of Home Economics and Education)

- Youth development and educational programs in every Oregon county. During 2003-04, these programs involved more than 6,000 adult volunteers and more than 100,000 youth.

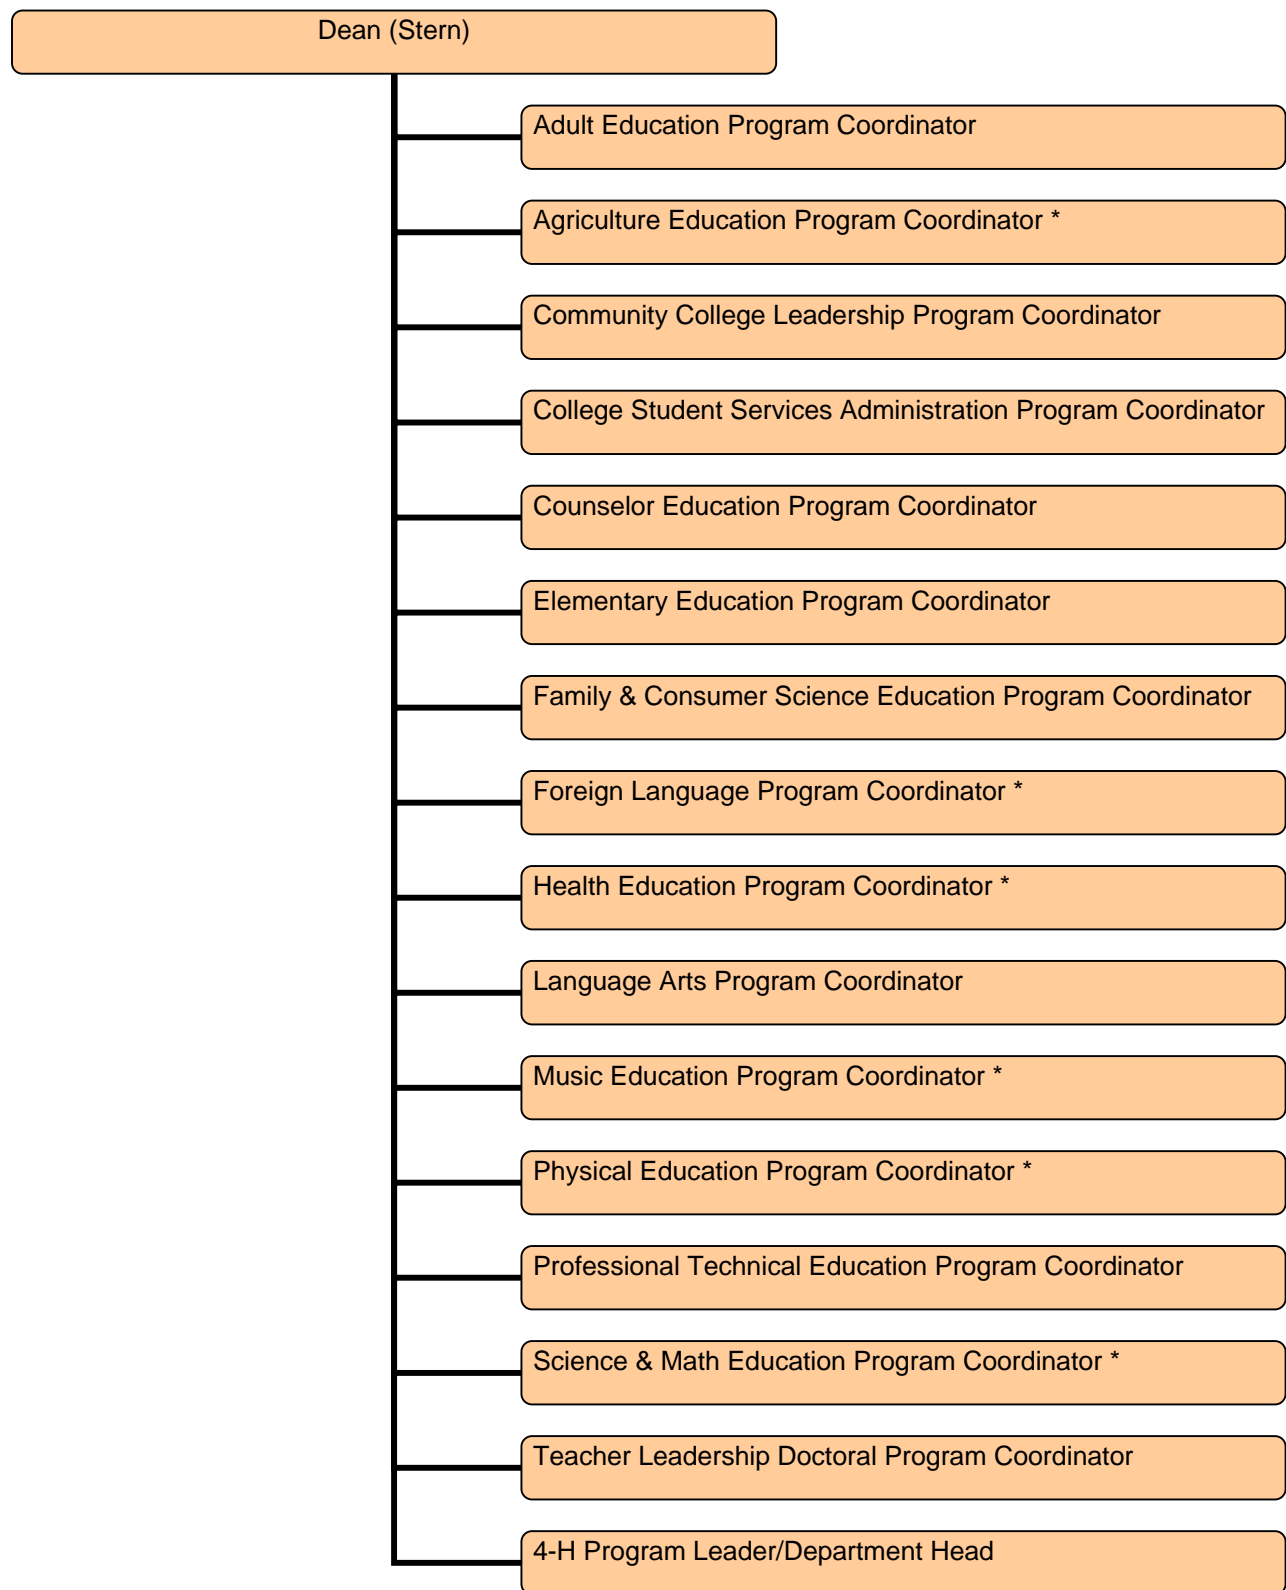

As part of this reorganization it is also appropriate to also consider the name of the education unit at OSU. Prior to being identified as a School in 199 (as part of the merger with Home Economics), the unit was identified as a College. Designation as a College makes more sense now. Most education units at land grant universities are colleges, such as those at the University of Illinois, Ohio State University, and Pennsylvania State University. There are some that are identified as schools, but usually only when they are part of a larger college, such as the School of Education at Colorado State University that is part of the College of Applied Human Sciences.

Designation as a School is not consistent with OSU's current organizational context. There is no other freestanding academic unit headed by a dean that is designated as a school. Designation as a school is becoming more confusing, particularly now that we are naming major units within colleges as schools (e.g. School of Electrical Engineering and Computer Science within the College of Engineering.) Designation as a College will more accurately reflect the growth of Education, the importance of the work in support of OSU's strategic plan, and the need for improvement and innovation in education at all levels in Oregon and the rest of the nation.

2. Location within the institution's organizational structure. Include "before" and "after" organizational charts (show reporting lines all the way up to the Provost).

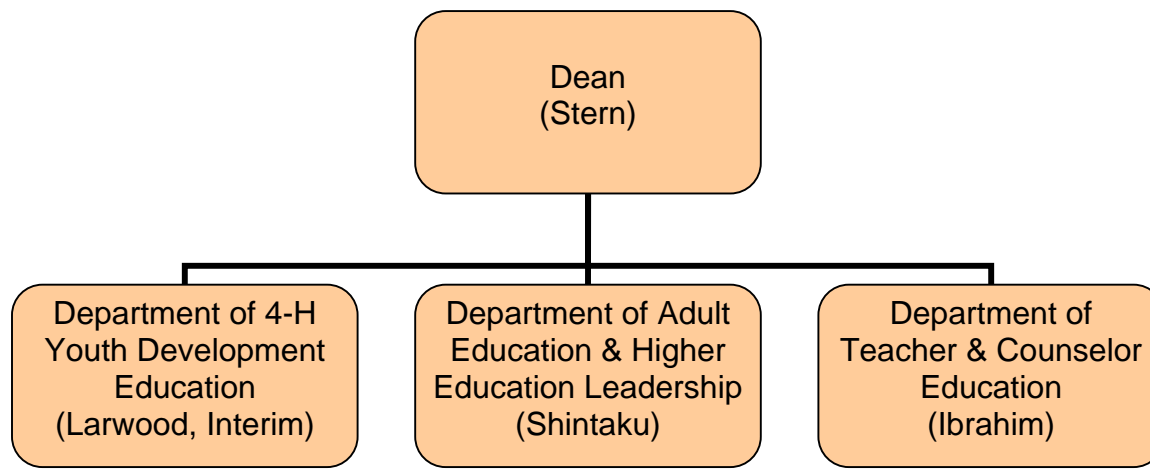

Location within OSU's organizational structure is the same as before with the unit designated as a "college" rather than a "school." The organizational structure within the College will be changed through the formation of three departments rather than a very large number of loosely organized programs representing as few as one or two faculty members.

School of Education Organizational Chart (Before)

* In collaboration with other OSU Colleges

School of Education Organizational Chart (After)

3. Objectives, functions (e.g., instruction, research, public service), and activities of the proposed unit.

The proposed unit name change and departmental organization are intended to improve effectiveness and innovation in instruction, research, and public service activities. It is anticipated that the departmental structure will facilitate alignment with OSU strategic goals:

1. Provide outstanding academic programs that further strengthen our performance and pre-eminence in the five thematic areas.
2. Provide and excellent teaching and learning environment and achieve student access, persistence and success through graduation and beyond that matches the best land grant universities in the country.
3. Substantially increase revenues from private fundraising, partnerships, research grants, and technology transfers while strengthening our ability to more effectively invest and allocate resources.

Furthermore, the proposed departmental organization will greatly help our ability to provide systematic assessment of unit performance.

4. Resources needed, if any: personnel, FTE academic, FTE classified, facilities and equipment.

No additional resources will be required for personnel, facilities and equipment. There are existing positions for Dean of Education (Sam Stern) and an Associate Dean for Research and Operations (Allan Brazier). There is an existing Department Head position for 4-H Youth Development Education (currently Lillian Larwood on an interim appointment). Program coordinator FTE will be consolidated into department chair positions for Teacher and Counselor Education and Adult Education and Higher Education Leadership. Farah Ibrahim will serve as Department Chair for Teacher and Counselor Education and Rich Shintaku will serve as Department Chair for Adult Education and Higher Education Leadership.

Below is a summary of personnel in the School of Education (Fall, 2004)

Departments (proposed)	Tenure-Track		Recurring Fixed-Term		Total	
	HC	FTE	HC	FTE	HC	FTE
Adult Education & Higher Education Leadership	4	3.7	4	2.6	8	6.3
Teacher and Counselor Education	11	10.7	10	9.5	21	20.2
4-H Youth Development	44	35.3	20	15.2	64	50.5
Total:	59	49.7	34	27.3	93	77.0

The faculty count does not include part-time fixed term faculty and the large number of clinical faculty who supervise teaching and counseling internships. The School of Education has partnerships for the placement of student teachers and counseling interns with 136 of the 198 Oregon school districts.

The total student head count and SCH numbers for the 2003-2004 academic year as reported in Data Warehouse by course prefix are:

Unduplicated head count	1,831
Student credit hours	17,029

Funding sources: state sources (institutional funds - state general fund, tuition and fees, indirect cost recoveries), federal funds, other funds as specified.

Only minimal new expenditures will be required; e.g. stationary and signage. The funds required for the name change will come from internal reallocation in the dean's office.

See Appendix B

5. Relationship of the proposed unit to the institutional mission.

The proposed unit name change and departmental organization is consistent with the organization of other OSU units and will better facilitate alignment with OSU's mission and goals. The proposed change will also significantly improve the operation and marketing of OSU education programs and better position them for success. It is anticipated that the new departmental organization will facilitate much better communication and collaboration with all OSU offices, including the Graduate School, Registrar's Office, Cascades Campus and Extended Campus. The proposed unit name change will be viewed as a very positive development by the more than 14,000 OSU education alums (more than 10% of all OSU alums) and will be helpful in the university's capital campaign.

6. Long-range goals and plans for the unit (including a statement as to anticipated funding sources for any projected growth in funding needs).

See Appendix A

7. Relationship of the proposed unit to programs at other institutions in the state.

The proposed change is an internal organizational change with no anticipated impact on other institutions.

8. If the program is professionally accredited, identify the accrediting body and discuss how the proposed change may affect accreditation.

Programs in the proposed Department of Teacher and Counselor Education are accredited by the Oregon Teachers Standards and Practices Commission (TSPC) and nationally accredited by the National Council for Accreditation of Teacher Education (NCATE) and the Council for Accreditation of Counseling and Related Programs (CACREP). The proposed departmental organization is highly consistent with the expectations of these organizations.

In the final report of their last accreditation site visit in 2001, TSPC (the teacher certification authority in Oregon) required us to “... *establish a clear line of authority through the implementation of the plan for the reorganization of the unit.*” More specifically, TSPC has recommended that, “*The unit should continue the work toward the development of a new organizational structure with a focus on the leadership and a line of authority that will foster growth and innovation in recognizing resource development in personnel, finance, and program development that is responsive to the community of diverse learners in the region.*”

This proposed reorganization will respond directly to the concerns raised by both TSPC and NCATE during their last joint accreditation visit.

Appendix 2

Draft

PROPOSAL TO TERMINATE THE PLANT PHYSIOLOGY GRADUATE PROGRAM
OREGON STATE UNIVERSITY
GRADUATE SCHOOL
CIP # 26-0307

December 28, 2004 (Revised February 5, 2005)

EFFECTIVE: Fall Term 2005

- 1. Title of the proposed instructional, research, or public service unit. For name changes, give both the current and proposed names. Describe the reason(s) for the proposed change.**

The graduate degree program in Plant Physiology has never met the potential anticipated at the time it was created. A principal factor was the rapid rise of molecular approaches to the study of plant biology. As a result, most graduate students have opted to pursue degrees in Molecular and Cellular Biology. Over time many of the faculty who founded the program have retired. The program is currently leaderless and has had no core activities for several years. A committee convened by Dean Sally Francis recommended that the program be terminated in 2004. (See attached letter dated February 2, 2004)

The recommendation for termination was based on a lack of faculty interest and low student numbers. Dean Francis approved program termination based on her discussions with Deans Bloomer, Arnold, and Salwasser (COS, CAS and COF). A copy of her decision is attached (attached e-mail dated April 12, 2004).

- 2. Location within the institution's organizational structure. Include "before" and "after" organizational charts (show reporting lines all the way up to the Provost).**

Not Applicable

- 3. Objectives, functions (e.g. instruction, research, public service), and activities of the proposed unit.**

- a. Explain how the program or unit's current objectives, functions, and/or activities will be changed. Where applicable, address issues such as course offerings, program requirements, admission requirements, student learning outcomes and experiences, and advising structure and availability. How will the reorganized program be stronger than the existing program?

Course offerings for this graduate program were assembled from existing courses offered by many departments. The program only offered blanket number courses. No non-blanket course offered at this time will be eliminated. Thus the four remaining students in the program will be able to complete their course work without difficulty.

Currently a group of faculty and departmental administrators from several colleges are developing a plan for a Plant Biology Faculty. As part of these efforts, the group is working to

ensure OSU has a wide array of course offerings needed for plant based graduate programs. This organization should provide a flexible way to support the needs of several existing programs and departments. This is indeed aligned with national trends as evidenced by the American Society of Plant Physiology renaming itself the American Society of Plant Biology (ASPB) in the late 1990s in recognition that plant physiology was a cornerstone to the broader discipline of plant biology.

- b. Explain how outcomes in the newly organized program or unit will be assessed.

Not Applicable

4. Resources needed if any: personnel, FTE academic, FTE classified, facilities and equipment.

- a. Identify the staffing and resource needs for the proposed program or unit. Note any impact on the budgets of affected programs or units. Provide an analysis of how the resulting programs or units will be adequately staffed and funded.
- b. Explain the extent to which affected faculty and personnel support this change.

Through out the years the Plant Physiology Graduate Program was provided a small stipend from the Graduate School for secretarial and office support for the program. This support was accomplished by utilizing department based office personnel. The stipend has not been provided for several years, as the program did not have a director. At no time were faculty lines or support personnel part of the program budget. Therefore, the termination of the program will have no effect on faculty of support personnel.

5. Funding sources: state sources (institutional funds – state general fund, tuition and fees, indirect costs recoveries), federal funds, other funds as specified.

- a. Identify the revenue and funding sources for the proposed program or unit (i.e., federal, state, other funding sources).
- b. If new resources will be required (e.g., for new faculty positions, graduate research/teaching assistants, facilities, equipment), explain where these resources will be coming from. Specify whether internal reallocation, college, institution, federal, state, private, or other funding sources. [Note: Deans/chairs/heads/directors of units committed to providing additional resources will be required to sign the proposal.]
- c. Provide an estimated annual budget for the proposed program or unit (see Appendices).

As described above, the program has received a small stipend (for \$5,000 to \$10,000 annually). The graduate school will be able to reallocate these funds to productive programs.

6. Relationship of the proposed unit to the institutional mission.

- a. How will the proposed program or unit support OSU's mission and goals?
- b. Describe potential positive and negative impact of the proposed change on the program(s) or unit(s) involved. Identify other OSU programs or units which may be affected, and describe the potential positive and negative impact on their mission and activities.

The termination of this program will have little effect on OSU's progress toward fulfilling its mission and meeting its goals. During the past 10 years, eleven students have enrolled in the Plant Physiology Graduate program. Most of these students have been international. Future students can obtain similar training in other graduate programs. Instructional needs in plant physiology will continue to be delivered through many departments. The group mentioned in 3. a. will continue to work to ensure a the breadth and depth of plant biology courses (including plant physiology) are delivered at OSU.

7. Long-range goals and plans for the unit (including a statement as to anticipated funding sources for any projected growth in funding needs).

Not Applicable

8. Relationship of the proposed unit to programs at other institutions in the state.

- a. What is the current relationship of the proposed program or unit to OUS and other higher education institutions in the state? Describe how this relationship might be altered based on the proposed change.
- b. Describe how the proposed change will affect other constituencies outside of OUS.

Not Applicable

9. If the program is professionally accredited, identify the accrediting body and discuss how the proposed change may affect accreditation.

Not Applicable

ATTACHMENTS

1. February 02, 2004 Letter from working group recommending program termination
2. April 05, 2004 E-mail from Sally Francis indicating agreement among the respective deans to eliminate the program.

Status of Graduate Instruction in Plant Physiology at OSU

February 2, 2004

Working Group: Barbara Bond

Mark Harmon
Robin Rose
Richard Waring
Adam Taylor (Ph.D. student)

Overview:

The status of plant physiology as a discipline has changed both at Oregon State University (OSU) and elsewhere over the past couple of decades. In the 1970s and 1980s, a large number of faculty in three colleges (Science, Agriculture and Forestry) taught courses and/or conducted research related to plant physiology. When the Plant Physiology Program was established at OSU in 1987, it filled a need for coordinating the offering of a graduate degree in this area. With the establishment of the Molecular and Cellular Biology Program in 1991, many recently-hired faculty and students found that program a better fit for their interests. In recent years, most of the faculty originally associated with the Plant Physiology Program have retired or changed positions, and most of those positions have either been eliminated or re-defined. Individual departments have adjusted to these changes, but the impacts of the collective loss of faculty and courses on the institution as a whole have not been considered. In a memorandum dated September 10, 2003, Dr. Sally Francis invited a group of interested faculty and department heads to consider these impacts. Dr. Francis posed three questions:

1. What role is there at OSU for a formal plant physiology graduate program?
2. What faculty strength is needed in plant physiology? What research needs does it serve?
3. How can plant physiology expertise (both teaching and research) be coordinated across departments?

A six-member working group (named above) met on Oct. 17, 2003 to share information and formulate responses to Dr. Francis' questions, and this report summarizes the consensus of that group. In addition, several others (also named above) contributed perspectives via email messages or conversations with members of the working group, and where possible the report incorporates their input.

What role is there at OSU for a formal plant physiology graduate program?

The working group recommends eliminating this degree program. The program has not had a budget since about 1995 and has had no active recruitment of students for many years. Since the retirement of

long-term director, Pat Breen, it has had no leadership. Five of the ten "core" courses in the program are no longer offered due to faculty retirements and reassignments.

One criterion of a valuable program is whether it is attracting high-quality graduate students that would not have come to OSU otherwise. Since the Plant Physiology program was initiated more than 15 years ago, three M.S. students and ten Ph.D. students have graduated from the program. Four Ph.D. students are currently enrolled. At least three of the Ph.D. graduates were already committed to graduate work at OSU before they opted to add or change to the program. Although three international students came to OSU specifically because of the program, it appears that the primary incentive for most others to come to OSU was a particular research group, professor, or research opportunity. The Plant Physiology program has been a good option for these students, but not a decisive factor in their coming here.

Research priorities at national and local levels change over time as questions are answered in one arena and urgent questions arise in others. Plant physiology no longer holds the separate research prominence it once held as a stand alone discipline. Indeed, the American Society of Plant Physiology renamed itself the American Society of Plant Biology (ASPB) in the late 1990s in recognition that plant physiology was a cornerstone to the broader discipline of plant biology. There remains a critical need to provide graduate-level education in plant physiology and related areas to support emerging research areas in many aspects of plant biology. Although the working group recommends eliminating the degree program in plant physiology, we think it is critical to the mission of the university to maintain high-quality opportunities in graduate education in plant physiology and related areas. This is described in more detail below. There is value in maintaining the group identity of an interdisciplinary teaching/research program in plant physiology or the broader area of plant biology to support the teaching and research mission at OSU

What faculty strength is needed in plant physiology? What research needs does it serve?

Graduate instruction in some aspect of plant physiology is either required by or desirable for & following programs:

A. Existing graduate programs

- Bioresource Engineering (Water related)
- Botany and Plant Pathology
- Crop Science (Cereal Breeding and Genetics, Crop Physiology, Crop Production, Forage and Pasture Management, Hop Breeding and Genetics, New Crops, Oilseed Crop Breeding and Genetics, Potato Production, Seed Physiology, Seed Production and Technology, and Weed Science)
- Horticulture
- Rangeland Resources (Ecology of Rangelands, Physiological Ecology, Range Improvement, Range Nutrition, Riparian Zone Management, Watershed Management)
- Forest Resources (Silviculture)
- Forest Engineering
- Forest Science (Silviculture, Tree Physiology, Forest Ecology, Forest Genetics)
- Environmental Science
- Civil Engineering

B. Pending interdisciplinary programs. (These programs are all in some stage of development. However, the fact that they are being considered as formal programs suggests these areas are recognized as important, emergent synthesis areas that have strong support at OSU).

Global Change Biology

Restoration/Conservation Ecology
Water Resources
Plant Breeding/Genomics

The Departments of Crop and Soil Science, Horticulture and Botany and Plant Pathology are currently offering courses in plant physiology for their graduate programs, although course offerings have been severely reduced. In other units (for example, the Tree Physiology option in Forest Science), lack of appropriate courses is problematic.

The instructional needs of these programs vary widely. When the working group tried to define the "core" areas of plant physiology that should be covered in graduate instruction to support these varied programs (i.e., to answer directly the question "what faculty strength is needed..?", they concluded that the chapters of good, current plant physiology texts provide a good framework for instruction. There are certain sub-disciplines, such as plant water relations, that are notably lacking in current course offerings yet critically important to many of the programs listed above. However, a "quick fix" of identifying one or two key courses is unlikely to solve underlying problems in the long run. What's needed, we decided, is a new model for graduate instruction: a series of graduate-level "service" courses that are developed and offered as a cohesive unit, supported by administrators and taught by faculty from multiple colleges.

How can plant physiology expertise (both teaching and research) be coordinated across departments?

We currently have the expertise at OSU and associated institutions (EPA, Forest Service, etc.) to teach the courses in plant physiology that are necessary for top quality graduate programs. However, this expertise is spread across colleges and departments - most programs and departments do not have the expertise to offer the courses they need internally, and even if they did, enrollments would be too low to sustain the courses. It is also critical to recognize that OSU faculty are already stretched and stressed to their limits. It is not realistic to consider asking faculty members to teach additional courses. If new courses are added, something else must be taken away.

As one member of the working group said, "We need unique approaches to do more with less and without adding stress". With this in mind, the working group proposes a new model for offering graduate courses that would involve collaboration among the Colleges of Agricultural Sciences, Forestry and Science, including several departments within each College. Here we offer only an outline of this model.

A modular approach for graduate instruction in Plant Physiology at OSU. We propose teaching plant physiology as a set of modules that can each be taught within a three-week period for one credit. The courses would all be offered at a specific time (MWF 9-10, for example). Instructors for the courses would come from many departments. Although the topic of each course would be very specific, each course would be designed to be relevant to graduate students from a variety of backgrounds and disciplines. It would be possible to offer students options among similar alternatives (for example, "plant responses to fertilizer" and "biochemistry of nutrient assimilation"). Although some of the courses could be required as prerequisites for others, they should be designed so that students could select only the courses they need for their programs. At the same time, they should be developed so that there is a level of connectivity among them all. Use of a common text could help in this regard.

One advantage to the 1-credit, modularized format is that it may be possible to take advantage of "non-traditional" teaching resources, such as visiting scientists, advanced graduate students, and adjunct faculty. As one example, Dr. Rick Meinzer, a USFS tree physiologist from the Forestry Sciences Laboratory in Corvallis, has expressed interest and willingness to contribute to such a teaching program. However, careful, ongoing management would be needed to maintain continuity and quality of the teaching. This will require the commitment and support of department administrators and faculty within the plant sciences from across the university.

Examples of possible topics for these modules include the following (no particular order is intended except for the first):

Basic overview of plant physiology
Herbicide physiology
Weed Science
Host/microbe/pathogen interactions
Photosynthesis

Attachment 2.

To: Coakley, Stella; Gartner, Barbara; Howe, Glenn Thomas; Karow, Russell

Cc: Bond, Barbara; Boyer, Charles; Bloomer, Sherm; Salwasser, Hal; Arnold, Roy G; Dutson, Thayne

Subject: Plant Physiology graduate instruction at OSU

Colleagues,

I'm writing to convey to you the outcome of the discussion among Deans Salwasser, Arnold, Bloomer and me regarding the future of graduate level instruction in the area of plant physiology at OSU.

We accept your recommendation to eliminate the Plant Physiology graduate degree program while ensuring that currently enrolled students can finish their degree as planned. We also accept your recommendation to charter a planning group that will become the core of a Graduate Faculty of Plant Biology that will be charged with developing the courses on various plant biology topics needed to support other graduate degree programs at OSU. As these degree programs are principally in the Colleges of Agricultural Sciences and Forestry, the two cognizant Deans will share joint responsibility for ensuring that essential courses are developed and offered in a manner that will meet the needs of current and future graduate students. They will coordinate this with other deans as appropriate, especially the Dean of the College of Science, and will maintain communication with the Dean of the Graduate School.

We invite you to serve as members of the planning group. The planning group for the Graduate Faculty of Plant Biology is charged to: a) organize a graduate faculty of plant biology; b) conduct a user needs assessment to determine what courses and topics are needed to support existing graduate degrees; c) assess the degree to which existing courses and faculty have the capacity to deliver the needed topics at the graduate level; and d) develop a delivery strategy to sustain capacity and fill identified gaps. That strategy may include the use of distance education, courtesy faculty, traditional courses, and/or modular courses as proposed in the February 2, 2004, report "Status of Graduate Instruction in Plant Physiology at OSU." The planning group will be co-chaired by Charles Boyer and Barbara Bond with the expectation the Dr. Boyer will guide administrative aspects of the strategy and Dr. Bond will guide course content and curricular aspects of the overall approach.

We expect to see the strategy by the close of Fall term 2004, including Category 1 proposals if needed.

We trust that you will be able to accept this assignment. Thanks very much for your continued excellent work on this very important matter.

Sally

GRADUATE COUNCIL MEETING

March 3, 2005

3:00pm, MU 213

Present: Pehrsson (co-chair), Steel (co-chair), Brown, Ciuffetti, Filtz, Francis, Koenig, Rettig, Rockey, Selker, Strickroth, Tadepalli, Unsworth, Waldschmidt

Absent: Bond, Pedersen

Guests: Gary Delander, Rosemary Garagnani

I. Approval of Minutes

The minutes from January 20, 2005, were approved as written.

II. Proposal from Pharmacy to allow a limited number of 7XX courses on a PhD program of study in specific degree programs

Theresa Filtz (Pharmacy) and Gary Delander, chair of the Department of Pharmaceutical Sciences, presented the following report/request to the Graduate Council:

Proposal: To allow up to 15 credits of 700 level--scientific and technical professional degree--courses in a Masters or PhD program of study.

Rationale: A critical shortage of research-trained health professionals is impeding the ability of health professional schools to attract and retain academic research faculty. Increasing the number of dual PharmD/PhD degree holders is one pathway to increasing the number of research-trained practitioners in academic health sciences. Demand for dual degree holders is high, supply is extremely low. To increase the appeal of the dual degree program, strategies must be developed to decrease the time from completion of the PharmD (4 years post-BS) and the PhD (~5 years post-BS) degrees from a minimum of consecutive nine years. Extant PharmD/PhD programs attempt to compress this timeline by allowing for the inclusion of PharmD courses in PhD programs of study and vice versa, using summer sessions to initiate research while between PharmD training years, and focusing research on clinically relevant topics (see Appendix I, programs of study for dual degree programs at Colleges/Schools of Pharmacy).

Additionally, the NIH is placing increased emphasis on translational research, i.e. research with applicability to solving human health problems, requiring some appreciation of clinical problems by basic science researchers. Biomedical PhD programs, including programs in pharmaceutical sciences, have always included training in medically relevant topics, e.g. human drug metabolism, drug action, drug development. Graduate PhD training in pharmaceutical sciences naturally includes overlap with topics covered in basic pharmacy sciences courses developed for PharmD professional students. For example, a pharmaceutical sciences PhD student concentrating in pharmacology would naturally take a year of Human Pharmacology (Drug Action) as

part of standard coursework. At other Universities, pharmacology PhD students frequently take this course alongside medical, pharmacy, dental or other health professional students in the same classroom.

To better develop a PharmD/PhD dual degree program at OSU, and to simplify overlapping course offerings for PharmD pharmacy professional students and PhD pharmaceutical sciences students, we are proposing to allow PhD students in pharmaceutical sciences to include 15 credits of 700 level pharmacy professional courses on their graduate programs of study. A proposed concurrent PharmD/PhD degree program description is included in Appendix II.

In relation to the outcomes expected of PhD training in pharmaceutical sciences (Appendix III), the 700 level courses will aid in fulfilling outcome #1, requiring that doctoral students acquire and understand a substantial body of knowledge which is at the forefront of studies in pharmacology, natural products chemistry, bio-organic chemistry, pharmaceuticals, drug metabolism, or drug toxicity.

The learning objectives associated with 700 level courses in the college of pharmacy are, we feel, of a sufficient rigor to comprise a graduate level learning experience. The stated characteristics of a 500 level graduate course (from the OSU Graduate catalog) are: 1) They require upper-division prerequisites in the discipline. 2) They require an extensive theoretical base in the discipline. 3) They increase or re-examine the existing knowledge or database of the discipline. 4) They present core components or important peripheral components of the discipline at an advanced level. Courses in the PharmD curriculum meet these requirements in various ways. The PharmD program requires upper-division prerequisites (See Appendix IV, Prerequisites for entry into the PharmD program). For example, either 400 level Physiology or 400 level Biochemistry is a pre-requisite for entry into the professional program and are prerequisites for the Phar 752, 753, 754 series, Pharmacology and Medicinal Chemistry. Pharmacy professional students are expected to integrate prior knowledge from multiple disciplines including physiology, chemistry, biochemistry, cell biology, and statistics. They are required to synthesize information from primary sources and evaluate drug choices based on principles. The courses present drug information at the cutting edge of current knowledge and challenge students to anticipate future advances in the field. One caveat of many 700 level pharmacy courses is that they are often large, with 80 students present. Therefore, we would suggest limiting the number of 700 level courses on a graduate program of study to 15 credits. Additional 500 level coursework and thesis research would address the remaining outcomes revolving around techniques and research project development and completion.

John Selker (Agricultural Sciences) suggested that, if 7XX courses are to be approved for use on graduate programs, they should be subjected to the Category II review process, which is used to gain approval for any other graduate course. Sally Francis (Graduate School) questioned the use of an asterisk if the courses were submitted as 400/500 courses because of the confusion about the role of a 400* course. Lynda Ciuffetti (Science) asked whether it would be appropriate to create 500/700 slash courses to avoid confusion about the role of the course in undergraduate education.

Dan Rockey (Veterinary Medicine) pointed out that his college, which uses 7XX courses for the Doctor of Veterinary Medicine (DVM) degree program, shares the interest of the College of Pharmacy in the use of selected 7XX courses on a graduate program of study.

The main question explored during the discussion was whether the Pharmacy 700 level courses meet the rigor required for graduate level learning. Filtz and Rockey argued that this is not the point. Professional (7XX courses) are more advanced and demanding than undergraduate courses, but they have a fundamentally different character from courses designed to prepare a future researcher.

Some confusion arose about the current policy toward use of 4XX courses on a program of study. Ciuffetti explained that allowing 7XX courses on a graduate program, especially if they are available for credit to students who have not yet completed a bachelor's degree, could confuse the very difficult issue about the use of 4XX courses (not permitted) and the use of the 5XX component of a 4XX/5XX course, which will be limited to 50% of a student's degree program beginning Fall 2005.

Rockey asked whether Veterinary Medicine would be required to submit already approved 7XX courses through the category II process before they could be used on a graduate program of study.

Dale Pehrsson (Education) noted that the description of professional courses as not meeting graduate program requirements was very hard to grasp because the coursework is both advanced and very demanding. "Rigor" does not appear to be the appropriate criterion to judge whether a 7XX course is appropriate for a graduate program of study.

Mary Strickroth (Graduate School) asked whether the fee structure affects the use of 7XX courses. Delander replied that the students who are concurrently pursuing either an undergraduate or graduate degree are considered PharmD students until completion of that degree. They then may become PhD students. He noted that the last two years of the PharmD degree do not take place on the Corvallis campus.

Francis said that some time would be needed to analyze how 700 level courses approved for the graduate level would be designated in university records. Delander expressed a sense of urgency for approval of their request, citing the effect the decision will have on current dual degree students and on the ability of the College to recruit new students.

Ciuffetti asked whether two designations could be given to the same course: 500 level for graduate studies and 700 level for use in a PharmD program. Delander opposes dual numbers because of scholarship ramifications and the blurring of lines between a professional degree program and a graduate degree. He strongly believes that the university is confused about professional degree programs. He believes that the Council does not understand what they are and what their rigor is. A 700-level course would be more demanding than a 500-level course with the same name. The approach to learning is different.

Rockey thought the conversation was constructive and recommended that whatever is approved for Pharmacy also be approved for 7XX courses in Veterinary Medicine.

Filtz noted that many PharmD courses are not appropriate for doctoral programs of study. She indicated that the College of Pharmacy would be willing to designate about 10 courses and provide them for review by the Graduate Council for use on graduate programs of study. She indicated that graduate students in the Pharmacy graduate degree program need to take some 700 level courses as foundation for their ability to function as researchers in their discipline. She also agreed that it is appropriate for Pharmacy graduate students to take courses outside their program of study.

Selker expressed appreciation for the argument that some courses that are mandatory for professional pharmacists are not necessary for pharmacy doctoral students.

Pehrsson asked how the similarities and differences in courses that are professional (but not graduate) and those that serve both purposes relate to the Council's discussion of what constitutes a true graduate education/experience.

Filtz said that she is interested in the Council's assessment of the 7XX courses. They are not similar to undergraduate educational experiences. At the same time, these courses do not provide necessary experiences for doctoral students who do need quite different courses. Those small, research-focused courses should be designated 5XX or 6XX and should play an important role in doctoral programs of study. She added that Pharmacy wants to provide legitimate recognition that some courses can be completed by two different groups of students—Pharm D and PhD students—and that these courses can apply to either or both Pharm D and PhD programs.

Pehrsson described the Category II process, in which a course is submitted by a department, reviewed by an academic college, reviewed by the Graduate Council, reviewed by the Curriculum Council, and finally reviewed by the director of Academic Programs. Bruce Rettig (Graduate School) suggested that, because all the 7XX courses have already been approved, the decision of approving some of them for use on a graduate program of study could be made by the Graduate Council.

Selker proposed that the Graduate Council approve the courses that successfully go through the category II proposal process for graduate level use, with no change in the number of credits. Ciuffetti asked whether the Council was discussing the use of some of these courses for PhD programs in Pharmacy and Veterinary Medicine or whether it intended to allow the courses to be used on any graduate program of study. Filtz supported Selker's proposal that the courses should

be accepted in other programs, if approved by a graduate student's advisory committee. Rockey agreed with this proposal with the understanding that 15 credits should be the maximum allowed. Ciuffetti noted that the proposal to allow any graduate student to use 700 level courses on a program of study is different from the original proposal submitted by the College of Pharmacy. She indicated that she had not thought through the ramifications for graduate degree programs other than the PhD in pharmacy.

The Council approved a motion that 700 level courses that successfully go through the category II proposal process be accepted as graduate level for programs of study.

III. Status report on European three-year degrees

Rettig offered two recommendations to the Council for their consideration:

- (1) Postpone consideration of admissions policy changes for this year year to allow informed discussion to take place by professionals who are more fully informed on the changes and their impact on U.S. graduate schools.
- (2) Ask the Office of Admissions to collaborate with any departments or programs that may receive an application from a student with a three-year European bachelor's degree.

He based these recommendations on the following premises:

- (1) Current European degrees are highly diverse, just as they are in the U.S. This is why our Office of Admissions relies on detailed guidance from the national association of admission professionals to advise us on what is equivalent to a four-year U.S. bachelor's degree.
- (2) This diversity is likely to continue, requiring us to rely on updated information from the professional associations to which Admissions, the Office of International Education, and the Graduate School belong. The Council of Graduate Schools had a useful discussion, which Mary Strickroth summarized for the Council committee. The organizations to which Admissions and OIE belong (AACRAO and NAFSA) have meetings this spring that include multiple sessions on this topic.
- (3) There is a lag from the time that the professional associations conclude the appropriate way to handle new credentials to the date when the professional reference literature is revised.
- (4) The uncertainty about this issue and the fact that many of our peers are not revising their admission requirements from Europe just yet suggests that we should delay any action to change university policy. Recent examples of no change are found at the University of Washington at http://www.grad.washington.edu/admissions/intl/pep_definition.asp and at Stanford University at <http://gradadmissions.stanford.edu/information/international.html>
- (5) The very tight focus on a specific course of study in many European universities means that the students will have mastered a subject thoroughly at the end of three years, but they may not have sufficient breadth to pursue a degree unless it is closely related to their area of study. For example, someone with a three-year degree in Physics from a strong European university should be well prepared for MS and possibly PhD work in physics in the U.S., but may have substantial problems crossing over into a different field of study such as a biological science without additional undergraduate preparation.
- (6) The discussions in Europe suggest that many agencies and employers are not convinced that a

three-year degree is sufficient for employment. It is not unreasonable to believe that initial graduates of three-year degrees are most likely to continue for a European master's degree.

- (7) If any students do apply, our Admissions Office is prepared to partner with academic programs and departments to make exceptions while waiting for sufficient information to make complete policy changes.

Brent Steel (Liberal Arts) added that the amount of learning currently present in European degrees varies significantly from country to country. Pehrsson noted that the emergence of three-year bachelor's degrees in Europe is related to a trend in Europe to improve the accountability of higher education and insure conformity to a minimum standard. Rettig said he understood that the apparently narrow focus of many European higher education programs may require OSU programs to provide for additional background if a European student or OSU wishes to add breadth to their education or change areas of study.

Dan Brown asked how the changes in higher education in Europe would affect OSU degree programs with large international student populations. Rettig noted that several of the international students at OSU now come as participants in exchange programs. Some of them choose to continue for an OSU degree and some of them return later for an OSU degree. Brown agreed that exchange opportunities are useful, but that international students make up an important part of some graduate majors including his own (Electrical and Computer Engineering).

Strickroth understood that some universities in Europe would graduate students with the new three-year European degrees this year, but that parallel tracks/degrees, such as the German diplom, will remain available until the new degrees are fully implemented and widely accepted by employers.

Rosemary Garagnani (Associate Director of the Office of Admissions for Operations) said that her unit expects to have a better sense of direction after the AACRAO and NAFSA meetings this spring.

Rettig shared his perception that the commitment to these new degrees by administrators in Europe has not always been accompanied by additional funding. Therefore, making these new degrees operational may be a challenge at many universities. Selker reported that he heard much excitement and commitment to the new degrees when he was in Switzerland recently. He is convinced that many U.S. universities will be accepting these students eventually.

Strickroth said that there is resistance to the new degrees in Germany because the Germans believe their educational system, including design of degrees, is doing very well in its current form. But, they have also said that they will adopt the new degrees.

The Council decided to proceed as Rettig recommended: to defer changes in policy until additional information is available and to ask Admissions and the Graduate School to work with any department or program that receives an admission application from someone with a three-year European bachelor's degree to determine eligibility for admission.

Appendix I to the Pharmacy Proposal:

1. University of Michigan College of Pharmacy

PhD programs of study include 15 extradepartmental and 12 intradepartmental credits. A typical PhD degree in Pharmaceutical Sciences may include 9 credits of coursework in the PharmD curriculum.

2. University of Florida College of Pharmacy

16 credits from the PharmD curriculum are allowed on the PhD program of study

3. University of Texas at Austin

No specific number of semester hours required for a PhD program. PharmD and PhD course numbering overlaps

4. University of Utah College of Pharmacy

Joint PharmD/PhD program has 20 credit hours counting towards both degree programs

5. Washington State University College of Pharmacy

A PhD degree program may include 9 credits of non-graduate coursework (out of 32 required didactic credits)

6. University of Houston College of Pharmacy

Upper level undergraduate and professional courses (5000 level) may be applied to the PhD program of study upon approval of the Department Chair. No limit stipulated.

7. University of Michigan College of Pharmacy

Several PharmD courses count towards the PhD degree program

Other PharmD/PhD programs with indeterminate cross over policies

University of Maryland School of Pharmacy

UC San Francisco School of Pharmacy

University of Southern California

Appendix II: College of Pharmacy Pharm.D./Ph.D. Program

The College of Pharmacy Pharm.D./ Ph.D. degree is offered to students seeking to utilize an understanding of the pharmaceutical sciences and contemporary pharmacy practice to broaden perspectives brought to investigations in biomedical research. The dual degree program fully explores patient care aspects of a professional degree, while preparing students to address critical questions that will advance scholarship in fundamental research. The ability to design and analyze foundational research that addresses pressing patient care issues is critical as we attempt to advance healthcare quality in the future.

General Requirements for the combined degree program:

- Completion of a B.S. or B.A. degree.
- Admission into the professional Pharm D program.
- Acceptance into the graduate program of one of the disciplines (pharmacology, medicinal/natural products chemistry, pharmaceuticals/biopharmaceuticals) in the College of Pharmacy through the OSU Graduate School.
- A cumulative 3.0 GPA in all graduate level courses and all professional courses attempted.
- Satisfactory review of performance for continued enrollment in the Pharm.D. / Ph.D. program each academic year.

General Curricular guidelines:

The combined degree program is designed to facilitate sequential completion of the Pharm.D. and Ph.D. degrees. As noted below, typically students can anticipate completion of the Pharm.D. degree within 5 years and completion of the Ph.D. degree within an additional 2-4 years. The exact length of time required to complete the Ph.D. is dependent, in part, on the nature and success of research conducted. Application for admission to the Graduate School should be initiated immediately upon being accepted into the professional program.

Professional Program curriculum

P1 and P2 years (1st and 2nd year of program):

Students are enrolled in the traditional professional curriculum. Several professional didactic courses can also be used for partial fulfillment of didactic components of the graduate program of study.

Experiential courses (or waivers) required before entering the P3 year should be completed by the end of summer following the P2 year.

P3 year:

Students enroll in the traditional professional curriculum during the P3 year.

- a. Before enrolling in the P3 years it is expected that the student will have completed 3 research rotations. Two options are provided for completion of the research rotations.
- b. Students may complete research rotations (6 weeks, full-time) in the summers before and after the P1 year, and after the P2 year.
- c. Students may complete research rotations during the academic year (10 weeks, part-time) following their P2 year. This will delay enrollment in the P3 until the following year (year 4 of the student's overall program).

P4 year (Experiential rotations):

The professional curriculum requires five patient care clerkship rotations and two elective rotations. Typically, the Director of Advanced Experiential Education will work with students to schedule patient care rotations in Blocks 1 – 5 allowing completion of these rotations by the end of January. The student will begin research in support of their Ph.D. program following completion of block 5. Research conducted during the first 12 weeks following completion of block 5 will be accepted as meeting requirements for completion of the two required elective rotations. Students should register for two elective clerkship rotations during this period.

The student, graduate advisor and Director of Advanced Experiential Education may collectively agree to extend the time period over which a student enrolls in and completes patient care clerkship rotations. The Pharm. D. degree will be awarded upon successful completion of all patient care and research clerkship rotations.

Graduate Program Curriculum

Students pursuing the Pharm.D. / Ph.D. option must apply to the Graduate School for acceptance into the graduate program upon notification of their acceptance into the professional program. Acceptance into the dual degree Pharm.D./Ph.D. program is contingent upon acceptance into the graduate program of one of the disciplines (pharmacology, medicinal/natural products chemistry, pharmaceuticals/biopharmaceuticals) in the College of Pharmacy.

Research Rotations:

Students are expected to select three laboratories that are engaged in research of interest to the student and complete a research rotation in each laboratory. As noted under the description of the professional curriculum, these rotations can be completed in summers, beginning as early as the summer before beginning the professional curriculum. Alternatively, a student may choose to spend the academic year following the P2 professional year completing research rotations. This will delay enrollment in the P3 until the following year (year 4 of the student's overall program). Regardless of the method used to complete research rotations, students are expected to select a graduate advisor and laboratory by the end of their third year in the College of Pharmacy

Didactic coursework:

Specific courses required for the Ph.D. degree are negotiated between the student, the graduate mentor, the College Graduate Studies committee and, when selected, the student's Graduate Program committee based on the student's research interests. Several courses within the professional curriculum may be accepted as partial fulfillment of didactic course requirements. (For example, the lecture sections of Foundations of Drug Action, PHAR 735, meet concurrently with Phar 590, which is required of all graduate students and would be accepted in lieu of Phar 590.) Pending University approval, a total of 15 credit hours of 700 level courses may be included in the graduate program.

Courses completed in fulfillment of graduate degree requirements may be completed at any time. It is important to note that professional program course requirements are substantial and it will likely not be reasonable to add graduate level courses to a full professional course load*. Most graduate level courses, that are not also professional courses, will be completed following completion of the professional curriculum. Students that choose to complete research rotations during the third academic year are expected to use that year to complete some graduate level courses

*(*If a student has already completed physiology and biochemistry before admission to the professional program, they are strongly encouraged to pursue additional graduate level courses during the first professional year)*

Graduate Committee and Graduate Examinations

Students are expected to identify a graduate advisor and laboratory by the end of their third year in the College of Pharmacy. The graduate committee should be selected in the fourth academic year and a Program committee meeting should be held before the start of the fifth academic year. Preliminary examinations should be completed within one quarter of completing didactic coursework (usually before or early in the sixth academic year).

Thesis Research and Completion of Ph.D. degree

Students are expected to commence thesis-related research immediately upon selecting a graduate advisor and laboratory. It is understood that requirements for successful completion of the professional program may severely limit the time available for a student to work on thesis-related research. While completing professional program requirements, however, the student should meet regularly with their graduate advisor, attend laboratory meetings when possible and conduct preliminary experiments. The student's research goal, while completing the professional curriculum, should be to become current in their chosen area of research and identify a general thesis topic.

Completion of the professional degree should be followed by a full time commitment to thesis-related research on a topic developed while completing the professional degree. Students will conduct research under the direction of their graduate advisor and defend their thesis at an

appropriate time, as determined by their graduate advisor and graduate committee. It is anticipated that most students will be engaged actively in research for approximately two years following completion of their preliminary examination. The Ph.D. degree is awarded upon successful defense of the student's thesis.

Financial Aid

Students are eligible for graduate teaching or research assistantships only during years in which they are primarily engaged in activities related to completion of their Ph.D degree. Alternative funding mechanisms may be available to assist students during the periods in which they are completing research rotations. Students will be eligible for professional student scholarships before receiving the PharmD degree.

Outcomes for a PhD degree in pharmaceutical sciences

1. Acquire a substantial body of knowledge which is at the forefront of studies in pharmacology, natural products chemistry, bio-organic chemistry, pharmaceuticals, drug metabolism, or drug toxicity

Metrics: Successful completion of required and optional didactic coursework
Successful completion of oral preliminary exam

2. Conceptualise, design and implement a project for the generation of new knowledge, applications or understanding at the forefront of pharmaceutical sciences,

Metrics: Successful completion of research proposal for preliminary exam
Acceptance of research thesis topic by thesis advisory committee
Number of internal and external predoctoral grants applied for and obtained

3. Understand, apply and modify current techniques for discovery research

Metrics: Participation in seminar series, works-in-progress monthly meetings and journal clubs
Successful completion of three semesters of research rotations in pharmaceutical sciences

4. Create and interpret new knowledge, through original research, of a quality to satisfy peer review, that extends the forefront of the discipline.

Metrics: One or more first author manuscript publications or patent applications prior to graduation

5. Effectively communicate research findings in oral form

Metrics: Satisfactory yearly presentations at the annual College of Pharmacy retreat alternating oral and poster presentations every other year, reviewed by peers and faculty

Participation in monthly works-in-progress seminars within the College

5. Gain employment of choice in the field of pharmaceutical sciences

Metrics: Number of graduates employed in pharmaceutical sciences

Pharm.D. Program Prerequisites

(Required Pre-Pharmacy courses for admission into the Pharm.D. Program)

Below is the list of the pre-pharmacy courses that need to be completed prior to the beginning of fall classes in the professional program. A bachelors degree is not required for admission to the Pharm.D. program. However, students must earn a bachelors degree prior to entering their third professional year. A path to earn a B.S. degree in general science from Oregon State University has been developed in cooperation with the College of Science.

Quarter credit hours

Course Name

OSU Course (Credit Hours)

General Chemistry/lab for science majors
CH 221 ,222 ,223 (15)

Biochemistry for science majors**
BB 490 ,491 ,492 (9)**

Organic Chemistry/lab for chemistry majors

Guests: Barbara Balz, Tom McLain

1. Applied Anthropology Follow-Up Review Report

Tom McLain (Wood Science and Engineering) introduced the following report, which he and Martin Fisk (Oceanic and Atmospheric Sciences) prepared after their visit with John Young, chair of the Anthropology Department.

Oregon State University

Review of the Degree of Master of Arts in Applied Anthropology Follow-up Report

November 2004

Background

In Fall 2002, an OSU Graduate Council Review Team conducted a formal review of the MA in Applied Anthropology (MAAA). The team report that was accepted by the Graduate Council recognized that the MAAA was a strong program, but also included recommendations for change and improvement. On November 4, 2004, Martin Fisk and Thomas McLain met with John Young, Chair of the Department of Anthropology, to discuss actions taken with the recommendations. This report summarizes that discussion.

Actions on Key Recommendations

Since the Review Team visit, the Anthropology department has focused on developing a new degree program leading to a PhD in Applied Anthropology. This has been a significant effort that may have taken precedent over addressing some of the key recommendations of the Review Team related to the MAAA. The PhD program was approved in April 2004, but the commitment of necessary resources from the Dean was not secured until October.

Recommendations in the report that were discussed during the follow up visit are presented here followed by the response of John Young in *italics* and non-italicized commentary by the authors.

1) Fixed term staff - The department must establish the credentials of instructors of graduate courses by providing the Graduate School and the Graduate Council with these credentials, and obtaining approval for them to teach graduate level courses. The department should maintain current resumes of these teaching staff. ***Most courtesy faculty teaching graduate courses have departed. Those remaining have graduate faculty status*** (this was not independently confirmed).

2) Program of Study - Curriculum Multiple level courses 3xx/4xx/5xx should be eliminated immediately regardless of actions taken by the Graduate Council in this matter. ***The 3xx/4xx/5xx courses have been eliminated.*** The online catalog, however, still lists 31x and

51x courses with identical titles. This error needs to be corrected.

3) Reduce the number of required courses, especially in the World Culture (51x) series, to provide faculty more time for research and other scholarly activities. ***The courses are still in the catalog, but they are not required in the major.*** The review team wonders if the goal of reducing teaching load has been accomplished if the courses remain in the curriculum at the undergraduate level. It is not clear that this change will allow more research for faculty which was the original intent of the recommendation.

3) Program of Study - Thesis The magnitude of student debt should be reduced. Two actions are suggested to do this. The faculty should be more proactive with grantsmanship to help provide greater financial support for students. Faculty should actively manage and monitor student progress, in concert with the continuous enrollment policy, to reduce the post coursework lag in degree completion. ***Greater success with grantsmanship by some faculty has been achieved.*** We could not assess if that significantly increased student financial support.

Determine the impact of the new continuous enrollment policy on the time to completion and percent completion of MAAA degrees and identify strategies to mitigate negative effects. ***No apparent action-probably too early to do so.*** There is no central monitoring of student progress, nor has an assessment of the impact of the continuous enrollment policy been made and it may be too early to tell if continuous enrollment is impacting the length of time to degree. The department will appoint a Graduate Program Coordinator next year-this position will be charged with monitoring progress. Anecdotaly, there may have been some cutting of corners by students to quickly finish degrees in order to avoid paying additional tuition and fees

Thesis topics should be selected by the end of the third term, and coursework or seminars should be provided to facilitate this. ***This still remains a goal. Thesis topic selection is potentially addressed in two courses (Theory and Research Design). The department does not monitor this centrally but leaves that to the major professors. This may be a responsibility of the Graduate Program Coordinator position.***

4) Administration Develop a departmental governance system. Students need to be involved in planning of curriculum, hiring, admissions, recruiting and other departmental business, where their voice would add value to faculty decisions. ***We think that this recommendation was intended to address the lack of student involvement in departmental governance. A graduate student representative has been appointed to attend faculty meetings. The student does not participate in other department governance. A group of students was involved in a recent faculty search with some success. The department does not plan to include students in admissions and business decisions.***

Clarify the role of courtesy, adjunct, and extension faculty in the department. ***Most courtesy faculty have departed. New graduate faculty have been added as a result of the PhD proposal. Those are not yet identified on the department web site or in recruiting literature due to the timing of the decision to move the PhD program forward.***

5) Facilities Upgrade student facilities with internet access and telephones. ***Student office spaces have been renovated, limited computer (three computers) access is available during office hours. The department attempted to add wireless access system but that has not been successful so far. No telephones have been added to student offices.*** The review panel sees limited effort to increase the integration of students into the departmental activities since the review team visit.

Find a venue to promote the department with displays of current work and material of anthropologic interest. ***No apparent action. There may be a site developing in downtown Corvallis that may be appropriate for this.***

Additional Recommendations

A) Program of Study - Curriculum Stage more courses over a two year cycle to allow separation of graduate and undergraduate courses. ***No apparent action but this may result from other changes.***

Courses in contemporary poverty, project management, and thesis selection should be

considered for addition to the curriculum once the number of graduate world culture courses is reduced. ***No apparent action. Some of these recommendations have been, and will be, addressed as the PhD program unfolds.***

B. Recommendations for Ph.D.

The faculty should develop a strategic plan for establishing a Ph.D. program to include:

1. A staffing plan to fill the growth needs and replace retiring faculty.
2. A draft curriculum that fulfills the needs of the M.A. and Ph.D. programs.
3. Establish greater national recognition for its graduate-level programs by increasing the level of grant funding and refereed and peer-validated scholarship.
4. A plan for improved facilities.
5. A plan for reducing student debt.
6. A departmental management plan.

Some of these may be addressed through the implementation of the PhD proposal with the first students to be admitted in Fall 2005.

Final Comment

Since the MAAA Review Team visit in 2002, the Department of Anthropology has added a new set of challenges with approval to create a new PhD program. Perhaps as a result, the department's responses to the recommendations of the Review Team were not fully satisfactory. We conclude that concerns about the program remain, and that the issues identified in the 2002 Review will make it difficult for the department to maintain and establish vibrant M.A. and Ph.D. degree programs.

Although John Young submitted a response to the follow-up report (see Appendix 1), Council members decided that their discussion should focus on the report written by McLain and Fisk.

Teresa Filtz (Pharmacy) asked whether a graduate program coordinator was ever appointed. McLain noted that the response from Young indicated that a coordinator was appointed. However, the person in place does not fulfill the vision suggested in the written response. McLain said that he and Fisk did not meet with the person identified by Young.

Lynda Ciuffetti (Science) asked McLain to comment on Young's statement that the Department of Anthropology does have a fully developed governance system and that Young does not understand why this was not apparent to the review team during both the review and the follow-up review. McLain said that the governance system was not well explained. When queried on the role of graduate students in governance, McLain said that Young described students as intensively involved in hiring and, to a lesser extent, in recruiting. Students are consulted on curriculum matters as needed and write articles for the departmental newsletter.

Barbara Bond (Forestry) appreciated the candor of the follow-up report and comments made in introducing the report. The report is good and should be approved. But, how can the Graduate Council get the department's attention? McLain said that he and Fisk did not get Young's attention during the follow-up visit and they do not sure why this was the case. Legitimate questions are left unanswered. Has the review process prompted positive change? The answer is unclear.

Brent Steel (Liberal Arts) said that some of the problems facing Anthropology are shared in Political Science and other departments on campus. Budget cuts have delayed faculty hiring. Plus, the large number of people who retired in recent years because of changes to the public retirement system may have increased faculty turnover. Young has retired and is working on a post-retirement appointment that may be ending in the near future. Perhaps he has a short time horizon that has reduced his interest in or ability to effect changes in the Department.

Dale Pehrsson (Education) asked whether Young should be invited to address the Council. Isn't that the normal process for a review report? Sally Francis (Graduate School) said that such a response is invited for the initial review, but not for follow-up reports. However, the Council could invite him if they so chose. Because the follow-up report is a fine product, the Council could approve it even if other actions are anticipated.

McLain suggested that the Council conduct a "follow-up to the follow-up" after a new chair is in place

for a short period of time. Ciuffetti supported that idea. Bond asked whether McLain and Fisk would be willing to do that additional review. Although McLain declined to answer that question, he did say that the upcoming implementation of the PhD program in Applied Anthropology would mark a good time for the review. The faculty in place are doing a huge amount of teaching with no slack capacity to take on the PhD program. The teaching load is worse now than it has been in some time.

Steel asked when the new PhD program would be reviewed. Francis said that reviews are required five years after a program is approved for delivery. But, with the delay in accepting students into the program, she was not sure when the review would take place.

Pehrsson suggested that the Council give a "heads-up" to the new department chair when the doctoral program begins. Concerns should be shared at the outset instead of waiting until the five-year review and then commenting on what is not going well. Bruce Rettig (Graduate School) reminded the Council of the excellent partnership between Dean Tammy Bray (Health and Human Sciences) and Carolyn Aldwin, the new department head in Human Development and Family Sciences. Dean Bray recruited Aldwin with the specific intent of enhancing graduate education and research in HDFS. The visit from Bray and Aldwin early Fall 2004 showed that this was an effective approach, which appears to be quite helpful in addressing issues in the HDFS review report. For similar reasons, Dean Kay Schaffer needs a thorough understanding of the concerns as she selects a successor to Young as chair. After Council members discussed alternative ways to share their concerns, Francis said that sharing these concerns is her responsibility; she will take the concerns to Schaffer.

Bond suggested that the Council needs a mechanism to put a stamp of approval on reports without showing support for the current operation of the program. Is that the Council's responsibility? Francis said under the new Program Review Guidelines review teams have the opportunity to comment on the strengths of programs including sharing its opinion on whether a program should continue.

Prasad Tadepalli asked McLain whether, after reading the written response from Young, are he and Fisk more satisfied with the progress made by the department than at the time of the follow-up review. McLain said that he continues to have concerns and said that Young did not do a particularly good job of defending his program.

Filtz asked whether the Council has the power to take any specific steps such as placing a program on probation. If not, what is the Council's role at this point? Francis noted that when a new program is being proposed, specific approvals are required. In the case of existing programs, the Council has great influence through faculty senate governance and through its written record-the minutes. She will definitely talk with Dean Schaffer. The minutes of this meeting will put the Council's concerns on record. This is normally the last step in the process until the next 10-year review.

Bond asked when the MAAA program would next come up for a review. If it suffers during the implementation of the PhD program, the Council might not know anything about this for several years. The Council continued to discuss the implications of alternative procedures for sharing concern and following up on steps to address concerns. Alternatives reviewed included a strong recommendation for immediate change, waiting for two or three years to allow new leadership to come in place and have an opportunity to effect change, and conducting a review between one and two years after leadership change,

Dan Rockey (Pharmacy) asked whether Young's response is part of the follow-up review report. Rettig suggested placing the follow-up report itself in the body of the minutes and appending Young's comments as an appendix.

After further discussion, the Council unanimously accepted the follow-up report as written by the review team.

Bond provided a second motion. First, another follow-up review should take place within one year. Second, the Council advises Dean Francis to meet with Dean Schaffer to discuss the Council's concerns and report back to the Council with the results. This motion also passed.

2. Approval of minutes

The minutes from from November 18 were approved as written.

3. Automated Checking of Prerequisites

Barbara Balz, Oregon State University Registrar, explained a new service that is being introduced for

course registration. Software has been installed that will allow an academic unit to block a student's registration if the student has not completed the prerequisites for a course. This process is currently being used on a pilot basis in two units in the College of Liberal Arts (CLA) and will be expanded.

The next steps come in two phases. The first phase will involve CLA courses. CLA will be asked to review all the prerequisites they previously stipulate and determine which ones they wish to enforce using the new system. An announcement will be issued from the Provost's office in February, followed two weeks later by an announcement from the Registrar's office asking that a list of the prerequisites be returned to their office no later than July 1, 2005. CLA units will identify which prerequisites will be enforced through the new system and which will be advisory (students will be allowed to enroll, but the prerequisite will alert them to the background needed to successfully complete the course). The responses will then be entered into Banner and the process tested for accuracy. One year from now (Winter term 2006), implementation will begin.

The second phase will include all other departments. Announcements will be sent to the university community soon. September 1, 2005 will be the deadline for departmental replies. Implementation will begin for units other than CLA, effective with early registration for Fall term 2006.

Departments would still have the option to list prerequisites in the catalog but not enforce them during registration. Departments need to be made aware that checking will occur only over courses completed within the student's study program. Graduate courses with undergraduate prerequisites will pose a significant problem in many cases. The checking process may block registration by students who have completed the prerequisites.

Bond noted that many courses use as prerequisites the wording "by approval of instructor." How will that work? Balz said that, if a unit wishes to require instructor approval, students will need to get the approval. A designated person in that unit then uses their BANNER access to override the system and allow the student to register. This will be a time consuming process for the instructor and office personnel that manage BANNER access. Bond continued by asking how the process will work with the new system. Can an instructor approve admittance, allowing the student to enroll? Balz replied that the system will work on an "all or nothing" basis. If the override is not in place on the system, the student can't register. If you decide you don't want the hassle during registration, the Registrar's office will not put it in as an enforced prerequisite. Each academic unit must review their prerequisites, course by course, and must use this new process judiciously. Exceptions can always be made.

Steel asked whether a course can be listed as an enforced prerequisite for undergraduates and as an advisory prerequisite for graduate students. Balz said that her office would work with departments on their logic. We can do logical operators such as "and" and "or" in various combinations, but such combinations must be coded for each course. The only thing the system can read is a course listed in the catalog. For example, a prerequisite of two years of Latin is not feasible. She also noted that this new effort has been motivated by departmental requests that prerequisites be enforced.

Balz agreed that this process would impact enrollment. Enrollment will go down in courses using the new system. That may be desirable, but we do not know. The decline in enrollment might be temporary for a couple of years at the undergraduate level. After two or three years, students will take more care in meeting the prerequisites. The Registrar's office receives many expressions of concern from students who meet Baccalaureate core requirements. This process will further frustrate these students. Use of the system must reflect good-sense judgments. Also, students have become accustomed to the 7 days a week, 24 hours per day registration process that is now available. Staff to support overrides will not be available on that basis. How should this be handled? Depending upon coding, course prerequisites may not appear in a student's record in spite of the fact that the student has completed the prerequisite. Nobody wants students spending large amounts of time running all over campus getting approvals and then showing up in the Registrars office to complete their registration.

The Registrar's office will send a list of current prerequisites for each course and ask the departments whether they wish those prerequisites enforced. That process is not the appropriate process to change prerequisites. Departments will need to use the Category II curricular change process to alter prerequisites. This will be true both for undergraduate and graduate courses.

The technology is part of the BANNER system. It has been used and it does work, but it creates complexity and increases the need for communication between students and instructors. Does the council have any suggestions they would like to make?

Ciuffetti said that she has no suggestion at this time. There may be suggestions to make after the process is in place and the faculty learn what works and what does not. Balz expects much to be learned during the coding process, both by her office and by departments. She expects that departments are likely to delete some prerequisites once they are required to reflect carefully on what is involved.

Francis asked whether there is any extra caution needed for graduate programs. Balz said that departments need to recognize that undergraduate courses probably should not be set as enforced prerequisites for graduate courses because the students' enrollment in the prerequisite will not commonly appear in the BANNER system.

4. Progress Reports from Committees

1. Service Courses

Hal Koenig (Business) said that a 1.5 page document had been drafted by John Selker (Agricultural Sciences). The Council had planned to implement this new addition to graduate program reviews in the upcoming program review in Statistics. The document was sent to the chair of Statistics, who declined to participate on the grounds that insufficient time and resources were available, given that the review is coming up soon and that the self-study is well under way. Koenig indicated that he would be willing to identify the largest users of courses taught in Statistics so that some sort of review could be launched.

Elaine Pedersen (Health and Human Sciences) asked whether anybody has considered emailing the departments on campus to explain what the review team hopes to accomplish. Francis explained that the review of Statistics is designed to review the graduate programs conducted by Statistics, not their service role on campus. However, a different review issue, review of service offerings, could be folded into the program review or it could take place as a separate review process.

Pehrsson recommended that the two reviews be done at the same time. Bond noted that all levels of the review process take a huge amount of time and expense. Separate reviews are not a good idea. Upon being asked how the Council could help Koenig, he suggested that, if other units typically use a sequence of courses in another unit, this would be helpful to know. He will write an email to departments and ask the Council to review it.

2. Three-year European Bachelor's Degrees

Significant efforts have been taking place in Europe over the past decade. By 2010, most European nations plan to provide a new set of degrees with common patterns for bachelor's degrees, master's degrees, and doctoral degrees. This reform process will require fewer changes in some countries than others. The first three-year bachelor's degrees are expected to be awarded in 2005. The Graduate Council needs to decide whether and when we will admit students with these three-year degrees. That is, will OSU agree that the new degrees are equivalent to a four-year U.S. bachelor's degree? Or, will OSU wish to change its admission requirements. Although Europeans are only a small fraction of the international graduate student population at OSU, many programs find these students to play a valuable role in contributing to the diversity of the student population and many of these students produce research results of great value to the university while they are students.

The European degree reform is also intended to make Europe more competitive in recruiting international students from other parts of the world, including areas such as Asia, where so many OSU students come from.

Mary Strickroth (Graduate School) agreed that OSU departments will need advice in determining how the three-year degrees match up against four-year degrees from the U.S. and other countries. She explained that the Europeans will begin to provide diploma supplements in 2005. The purpose of the diploma supplement is to clearly document the educational outcomes and to make it easier for European graduate programs and employers to understand what a student has accomplished. Until diploma supplements begin, OSU will need to assess credentials on a case-by-case basis. She also noted that higher education in Europe will be taught in English to provide easier movement from country to country. This should make the graduates more interesting to the U.S., but it is also likely to attract more Chinese students to Europe. A spokesperson at a conference sponsored by the Council of Graduate Schools assured U.S. graduate deans that the quality of European education will be maintained but that variability of quality can be expected from country to country and within each country.

Steel indicated that he had learned a great deal in a workshop session earlier in January. He singled out remarks made by Strickroth as especially helpful. However, more discussion is needed. OSU should be careful in making generalizations about European students. In particular, OSU should not want to risk losing highly qualified students.

3. Doctoral degree regulations

Rettig noted that the Department of Nuclear Engineering will visit the Council about their distance-delivered doctoral degree and to ask for modification of the requirement that three terms take place in Corvallis on a full-time basis. He recommended that the Council reflect on what a PhD experience should provide as background before turning to considerations of changes in this or other doctoral degree requirements. Is the PhD intended only to train somebody to research a particular topic. Or, are there other expectations such as preparation for multiple occupations, for service as a steward of the discipline, for abilities to work across disciplinary boundaries or for other learning outcomes? Pehrsson will notify the committee exploring this larger issue of a time and place to continue these discussions.

Appendix 1:

Responses to Recommendations from MA Review
Department of Anthropology
January 12, 2005

Key Recommendations

1. The policy of the Department is and always has been to gain approval from the Graduate School for all fixed-term instructors teaching graduate students, i.e. nominate them to the graduate faculty. We have followed this procedure numerous times, as we have been hiring five or six each year, and often not the same people, to teach anywhere from one to six courses. Since the review in the fall of 2002, we made one inadvertent error and corrected it before the end of the term. It will not happen again! We keep current resumes of fixed term teaching staff, updated once per year.
2. We have eliminated all 3xx/4xx/5xx courses in the schedule of classes for the last two years. We no longer offer these courses either as 4xx or 5xx, only as 3xx. The 4xx and 5xx courses have now been eliminated from the catalogue as well.
3. We no longer offer World Culture courses. One or two Peoples of the World 3xx courses can be used as options to fill major requirements, but they do not constitute a separate requirement. We have reduced the number of 3xx courses offered each year from six to four. Overall we have simplified the requirements for majors so that there are fewer separately required courses that need to be taught.
4. Grants have increased in the last two years. We have supported several graduate students as "student workers" on grants during this time. We also have increased teaching assistantships from an average of 7 per term to 11 per term. This has allowed us to approve 95% of TA applications during the last two years. The continuous enrollment policy has resulted in several inactive students coming back to finish before being forced to pay tuition again in the fall of 2004. Several also have begun paying tuition for one or two terms before they finish. Several others have chosen not to come back to finish. For these reasons our completion time is becoming shorter.
5. Students must select a thesis topic by the end of their second term. Coursework starting in their first term and through the year helps them to select a topic and prepares them for thesis research. In a required course in research design during spring term, they write a research proposal on their selected topic. The vast majority of students do not need an additional course in topic selection.
6. I am not sure how the review committee missed this point. The Department has always had a governance system, including faculty meetings three times per term, and various committees, such as curriculum, personnel, budget, P & T, and ad hoc committees such as search committees and the committee that developed our Ph.D. proposal. Committees do some routine work and also develop initiatives to bring to faculty meetings for consideration and a vote. Sometimes issues raised at faculty meetings are referred to committees to gather more information and make recommendations. We keep minutes of all faculty meetings including a record of all formal actions put to a vote and a summary of

discussion. Also we have a number of special assignments carried out by individual faculty, such as allocating office space to graduate students, acting as liaison to the Anthropology Club, serving as Graduate Program Coordinator, library liaison, internship coordinator, etc. A graduate student liaison attends faculty meetings, and helps to enlist other students for committee work or other special tasks, such as helping to evaluate candidates in searches this year and last year to hire a new faculty member. The chair conducts annual reviews for all faculty, P & T reviews, and five-year post tenure reviews.

The office manager and clerical staff all have clear and well-defined duties. The buck stops on the chair's desk.

I inquired with the review committee, external reviewers and the Graduate School about what the committee had in mind in saying, "Develop a departmental governance {management} system." Nobody seemed to know.

7. Students are intensively involved in hiring, and to a lesser extent in recruiting. We consult them on curriculum matters as needed, but not on admissions because of the need to maintain confidentiality of student records. We pay a graduate student every year to edit and write articles for our departmental newsletter.

8. Our extension faculty member who is based in Corvallis participates fully in the department. When we hire him to teach, we buy his time from extension. The extension faculty member based in SW Oregon has the same privileges, but geography prevents her attendance at meetings except when she visits Corvallis once or twice per year. We have appointed five faculty members outside of anthropology to our graduate faculty. They also teach courses in their departments for our graduate students to use in their area of concentration. We have one courtesy faculty member who is also on our graduate faculty and performs teaching and other duties. We have terminated all other courtesy faculty members.

9. We have installed three new computers in the biocultural lab. Graduate students have access to and frequently use these computers for data crunching and Internet access. Most also have laptops and wireless access to the Internet. We now have wireless capability throughout the entire department except for a few dead spots that CMC has promised to fix by spring term. We have renovated graduate student offices, installing three telephones, new chairs, new paint, and window blinds. We have completely renovated our historic archaeology lab where graduate students work with new cabinets, carpets, paint, desk space and chairs. We have also just completed the final stage of renovating our biocultural lab in the same way, also including sink space. Our prehistoric archaeology lab has partial renovations in place with others continuing. We have new tables, chairs and carpet in our smaller (30+ seats) classroom, new chairs and carpet in our conference room. We have a new mobile media cart in our larger (50+ seats) larger classroom. The cart includes a keyboard, flat monitor, and remote control, along with a VCR and DVD projector that will project onto a big screen. We will have a similar cart in place in our smaller classroom before the end of this month. Faculty are actively seeking additional funding to further develop and improve lab resources.

10. Students are in charge of a display case in our student lounge situated between the main hallway and a classroom to showcase their research activities; communicate upcoming events, student and faculty publications. At present, the display contains copies of the Pacific NW Series monographs published by the department.

Additional Recommendations

11. We are moving some courses to a two-year cycle and eliminating 4xx/5xx slash courses with the goal of separating all graduate and undergraduate courses. We expect to have these changes completed within the next 18 months.

12. The faculty member who taught Wealth and Poverty has now retired. We anticipate that a new faculty member starting in the fall of 2005 will add a substantial component on contemporary poverty to this course, and/or develop an additional course on this topic. There is no consensus among students that they need a course in project management, and if so, they can find a course in COB. With new faculty arriving in the near future, we expect to see some curriculum change to fit their expertise.

13. Our graduate students are supposed to have a thesis topic ready to discuss in their program meeting by the end of their second term. Then they develop a research proposal in the Research Design course in the spring. I have mentioned the continuous enrollment policy and its effects in #4

above. We have tried to mitigate its effects by informing all students, active and inactive, of the specifics of this policy and its possible consequences. We have discussed the situation of particular students in meetings and suggested actions to be taken, etc.

Recommendations for Ph.D.

14. We have a staffing plan in our Ph.D. proposal that was widely circulated and approved. We also have an inclusive staffing plan worked out with the CLA Dean to replace retiring faculty. I should emphasize that up to this point, we have not lost any positions, as the Dean has given us fixed term positions as placeholders until permanent faculty members are hired. It is also true that we have not added any faculty members as designated in the Ph.D. proposal. The start of the Ph.D. program has been delayed to the fall of 2006, presumably to get more permanent hires in place.

15. We have a draft curriculum that fulfills the needs of the MA and Ph.D. programs in the Ph.D. proposal. Our schedule of classes next year includes six stand-alone 5xx courses, up from two at the time of the MA review. It shows that we have the capability to launch the Ph.D. program the following year. We are also convinced that this new curriculum will better serve MA students as well.

16. Grant funding this year is at \$277,663 dollars, up from \$180,363 dollars in 2002. Our two newest faculty members are among the most active in this respect (One has a grant for half a million dollars over four years, while the other has several small grants and a permanent endowment from which he can draw for research, student support, etc). We have three candidates coming in this week to interview for our position in environmental anthropology. All three have jobs at other universities and have good records getting grants. They say that they are attracted to our department because of the new Ph.D. program. We are turning away numerous students who hoped to apply to enter this program in the fall of 2005. Part of this keen interest comes from advertising faculty grants and scholarships on our web page. The Department encourages sabbaticals, grant buy-outs and release time for producing refereed and peer-evaluated scholarship. Since 2002 we have increased this output and had three faculty members promoted because of it. Another is well positioned for promotion next year.

17. Facility upgrades have gone well beyond the planning stage, as described in #9 above.

18. Changes made to reduce graduate student debt are mentioned in #4 above. In addition we have added seven online courses and have three more in development for distance education to bring revenue into the department. We plan to turn most of these courses over to Ph.D. students to manage and gain financial support. The OSU administration recently approved an interdisciplinary rural studies proposal that provides tuition and \$15,000 for a half-time graduate research fellow for one of our Ph.D. students in each of five years. (Faculty also may get release time for grant writing through this rural studies initiative.) Also the Dean of COB has agreed to give a similar .5 FTE fellowship in marketing ethnography each year indefinitely into the future to one of our Ph.D. students as part of its Austin Entrepreneurial Program. The Ph.D. program clearly is generating and will continue to generate funding from sources not previously available to us, including government agencies and foundations.

19. The Department management plan/governance system is described in #6 above.

I hope I have been able to clarify and resolve any lingering issues related to our graduate program. We have had some miscommunications/misunderstandings related to the MA review, but overall I think we have substantial accomplishments to show in meeting the reviewers' recommendations. Please let me know if you need further clarifications or explanations.

Graduate Council

November 18, 2004 Minutes

Present: Pehrsson (co-chair), Steel (co-chair), Bond, Brown, Ciuffetti, Francis, Koenig, Rettig, Pedersen, Rockey, Selker, Strickroth, Tadepalli

Absent: Filtz, Unsworth, Waldschmidt

Guests: Bill McCaughan, Mark Merickel

1. Extended Campus and Graduate Education

Pehrsson and Steel announced that the Council decided to work on three issues this year. Brent Steel, Prasad Tadepalli and Michael Unsworth will study the new 3-year European bachelor's degrees and their impact on OSU. Dan Brown, Lynda Ciuffetti, Theresa Filtz, Elaine Pedersen, and Dale Pehrsson will consider changes in PhD requirements including possible changes in the residence requirement. Hal Koenig and John Selker will work on the question of global support courses. To launch consideration of global support courses, Koenig and Selker will develop questions to be included in the Graduate Program Review of Statistics. Not only does the Statistics Department offer majors and minors, but their courses are key to many other graduate programs on campus. Experience with reviewing their courses that provide support for other units on campus will lead to similar considerations in future program reviews.

John Selker (Agricultural Sciences) asked whether it was true that courses could meet the master's residency requirement even if the student taking the course was at a location away from Corvallis. McCaughan said that this was correct. Noting that the master's residence requirement included 30 credits, Selker said that the policy does not stipulate which courses must be delivered on campus. He wondered whether this needed to be specified because the policy evolved before the expanded use of distance delivery through Extended Campus came into being. McCaughan said that requirements for location of delivery is program specific. Faculty in the department or program offering a degree must take responsibility for making distant students get together on a specified schedule to legitimize the graduate student experience. This needs to be carefully spelled out so there are no surprises for the student.

Dale Pehrsson (Education) asked about the basic outcome or intent of resident requirements? Bruce Rettig (Graduate School) said that some universities provide information about their intent, but that he had not brought any of those statements. He said that he had been a member of the Graduate Council when the most recent changes to residence requirements were made. Many faculty see the residence requirement promoting key goals of graduate students learning from each other by attending each others' seminars and studying together. The opportunity to meet many faculty members face to face, both in classes and outside the classroom environment is seen by many faculty as a key part of the graduate learning experience.

John Selker (Agricultural Sciences) observed that the graduate student body was primarily doctoral and asked how they are incorporated into teaching. Are they used as graduate teaching assistants? Aldwin said that graduate students do much independent teaching. She does not think it is a good idea for graduate students with little experience to teach independently, but agreed that this was appropriate for more experienced graduate students. Graduate students with less experience should assist in courses and focus on their research. Currently there is one graduate teaching assistant for every 100 students enrolled in a course.

Brent Steel (Liberal Arts) argued that doctoral and master's degrees often provide a qualitatively different experience. Many master's degrees are terminal degrees, often providing a credential useful for entry to specific professions. Doctoral education is quite different.

Pehrsson said that a quality connection between students and faculty can be provided in ways other than a residence requirement. The intent of the residence requirement can be met in several ways, both on and off campus.

Sally Francis (Graduate School) suggested that the Council begin their thinking by focusing on the learning outcomes that are expected from a degree program. Then ask how the learning outcomes can be achieved. The residence requirement and other policies should be derived from the learning outcomes and the strategies for achieving them. Unfortunately, at many institutions, learning outcomes for graduate degrees are not being addressed. There is little information from other programs or from OSU history to use to develop a residency policy based on outcomes.

Barbara Bond (Forestry) asked Francis to share her perspective as the Dean of the Graduate School on what desirable outcomes would be. Francis said that the Graduate School focuses on general, sometimes global qualities: the ability to formulate questions, answer them, think critically. She currently does not have a document that lays this out. Bond said that in her department (Forest Science), the students should be able to conduct independent research in their area, develop networking and communication skills, and write proposals; their graduate education is not simply some body of knowledge.

Merickel said that he has had a lot of experience teaching graduate students. In the School of Education, evaluation and synthesis are considered the key cognitive skills; these are developed through the creation of scholarship, collaboration with others, independent research, and communication skills.

McCaughan noted that many Extended Campus degree programs are cohort based. In a cohort-based cyber-environment program, there is often more interaction among participants than in a regular classroom. When Oregon State University places programs in such an environment, Extended Campus wants to assure the quality of the experience.

McCaughan said that he took ten pages of notes as he reviewed residence requirements at other institutions (see the summary in Appendix 1). One institution addressed residency by hours enrolled in any course offered through the institution. That language, taken at face value, does not necessarily meet the spirit of the regulation.

Selker said that the limitation on transfer credits is related to his concerns about the residence requirement. What is so special about OSU credits compared to those earned at other institutions? What are we trying to achieve by requiring a certain number of the credits being earned at OSU? Revenue generation?

Rettig suggested that there might not be any need for transfer of courses to a doctoral program of study if the focus is on outcomes. Assuming that degree programs have approved learning outcomes, strategies for achieving the outcomes and processes for assessing the completion of the outcomes, why worry about transfer credits? Rely on departments to determine whether and when students have developed the knowledge base and skills necessary for a program and have documented their application. Oversight might then be on better and more frequent program review and less on student-by-student review, which would be more frequently left to the academic program.

After McCaughan and Merickel left the meeting, Rettig explained why he left the room to visit with Terri Fiez, Director of the School of Electrical Engineering and Computer Science. Fiez is interested in developing joint doctoral programs with high technology firms and is also interested in exploring a joint program with universities in China. Andy Klein, Head of the Department of Nuclear Engineering, is interested in the possibility of a doctoral program that would be a combination of courses delivered by Extended Campus, direction of studies by a faculty member in his department, and studies at a leading nuclear research facilities. Some time ago, Rettig had suggested that Fiez and Klein attend this meeting. When the Council decided to discuss issues only with McCaughan and Merickel, Rettig left word with Fiez and Klein, but Fiez did not receive the message. During his conversation with Fiez outside the meeting room, Rettig reported Fiez's concern about delays or denials of visas for Chinese students. Students admitted to a program from China might have difficulty in meeting the residence requirement.

Bond commented on a telephone call she received from Fiez on this issue. She said that Fiez is an innovative scholar and leader. Bond would like to review the proposal about the collaborative program in China based on rules and regulations that might be modified to permit such a program. Not only will there be delays in granting visas, but also the Chinese government may be reluctant to let students come even with a visa.

Steel noted that some programs might want to collaborate with the Peace Corp. A student could enroll for course work through Extended Campus and then meet their Peace Corp obligation, which might include an internship experience. This could be another example of a possibility of a regulation squashing something good.

Selker said that Chileans think a US degree certifies that the recipient came to the United States, acclimated, and developed fluency in the English language. Because this enhances their ability to work in a global context, they are willing to make many sacrifices to earn such a degree. The MENG, by failing to incorporate a research experience, will water down the meaning of an OSU Engineering degree to these students. Greater reliance on e-campus will have the same effect, but this is a tide that cannot be stemmed.

Lynda Ciuffetti (Science) said that the Graduate Council should consider the evolution of graduate policies. She does not see residency as a hoop to jump over; and she strongly believes in it, especially for the PhD program. Students need to be immersed in the university experience to grow as scholars to the level expected by the OSU faculty. She sees her students grow through the interaction with faculty, peers, and students outside their discipline across campus. Residency is extremely important. Although the Council can consider changing residency, this needs careful consideration before doing so; it may choose not to make a change.

Bond agreed that there is no substitute for graduate students interacting with each other in person. She strongly believes that the Council should focus on outcome-based regulation. At least half of the courses she took as a graduate student are no longer offered on the Corvallis campus. Students must be sent elsewhere to get the required courses at a huge expense. What other option is there than to team up with peer institutions to share courses? The resources on the Corvallis campus do not come close to meeting the needs of the students. Oregon State University does not offer the complete graduate experience in many degrees.

Ciuffetti agreed with Bond. Students are not getting all the advanced courses they need. Isn't this something the university should be facing? Shouldn't OSU be seeking the necessary resources? Pehrsson said that this conversation fits in with the second interest area the Council decided to work on (PHD course requirements). Perhaps an ad hoc Council committee can research this issue.

Selker asked for an explanation for difference between doctoral residence, which includes a requirement for three terms on campus, and master's residence, which does not require time on campus. Rettig noted that a committee of the Council reviewed this issue at depth and that the Council had also discussed the issue at length. After several years of experimenting with satellite and other forms of transmission of courses and with new technology to assist in undergraduate and graduate education, the Graduate Council in 1996 decided that courses that were delivered by OSU graduate faculty should be considered relevant for meeting residence requirements whether the student was located in Corvallis or not. This applies to the course component of residence requirement for both doctoral and master's students. The Council did, however, let stand the requirement for doctoral students to be present on campus for three terms.

Ciuffetti returned to the question of availability of important courses from a distance. Her department (Botany and Plant Pathology) is an example. Their students participate in an Internet II course through collaboration between Kansas State, Nebraska and OSU. Those institutions should take credit for this initiative. OSU should have paid closer attention to the need to share faculty resources between campus to provide coursework in low-enrollment, but valuable subjects. Bond agreed that OSU should make it easier for students to go elsewhere to pick up courses they need, not harder.

Ciuffetti said that another aspect of residency is not being considered. Doctoral education includes training in many skills needed for work in a university, research organization or government agency. Graduate students need to learn how to teach, how to prepare research proposals, to budget resources, to deal with others (faculty, students and people outside the university). Being immersed in the university enterprise through physical residence is valuable to achieve this broad set of degree outcomes.

As the Council continued to explore outcomes achieved through residency, Ciuffetti asked how someone who does not participate in activities in Corvallis achieves loyalty to OSU. Bond argued that loyalty is not an important degree outcome. Pehrsson said that the EdD in Education with an area of concentration in community college leadership is a cohort program that meets off campus (in a retreat facility in Silver Falls) and integrates students through other contacts. The cohort program builds loyalty and experience because of faculty commitment and interaction between students and faculty and between students and other students.

Dan Rockey (Veterinary Medicine) concluded that all the points made by Council members have been department specific. He suggested that the residency requirement decision should also be department specific and left to departments and programs.

Bond, noting that other universities must have wrestled with this same issue, asked whether budget was available to bring speakers to campus to explore these issues. Should a seminar be planned to explore ideas about the meaning of the PhD?

Following additional discussion on ways to approach this topic, the Council decided to continue the dialogue with a committee on the topic (see below).

2. Approval of Minutes

The minutes from October 21 and November 4 were approved as written. The program review reports for CSSA and Adult Education will appear as appendices to the October 21 minutes.

3. Policy Issues to be Studied in 2004-2005

The minutes from October 21 and November 4 were approved as written. The program review reports for CSSA and Adult Education will appear as appendices to the October 21 minutes.

Appendix 1: Materials distributed by Dean Bill McCaughan, Dean of Extended Campus

GRADUATE COUNCIL MEETING
November 18, 2004
3:00pm, Kerr Admin. Bldg. 650

Residency Requirements for Graduate Programs

Discussion Item:

Insuring policy compliance for residence requirements for online, hybrid, or off-campus site-based graduate programs offered through OSU Extended Campus.

Observation:

Current OSU Residence policies are flexible enough to accommodate the needs of both the academic program providers and students admitted and enrolled in graduate programs included in the Ecampus program inventory and offered by academic units in partnership with OSU Extended Campus.

Proposal:

To insure compliance with these policies, the following process is recommended for Graduate Council consideration for graduate programs included in the Extended Campus program inventory:

Extended Campus will be responsible for:

1. Coordinating with the Graduate School and the academic program provider to report graduate programs proposed for addition to the Ecampus inventory, including anticipated program start timelines.
2. Collaborating with the Department to insure that terms of residency are delineated, including:
 1. Purpose and goals of residency

2. If residency requirements are proposed to be met at an off-campus location, as provided by policy, justification for the off-campus location will be delineated and provisions for fulfilling the purpose and goals of residency for the program identified.
3. If a change to the existing residency practice for that degree is proposed, the reasons for the change will be delineated, provisions for meeting the purpose and goals of residency for the degree will be described, and the proposed changes submitted to the Graduate School and Graduate Council for review and approval.

Extended Campus will not include a degree in the Ecampus inventory for enrollment and/or delivery until the above requirements are completed and approved.

OSU Extended Campus November 18, 2004

Background Information for the Discussion on Residency Requirements

In preparation for this discussion, the following Residence/Residency Policies were reviewed to establish an overview of the current practices among similar institutions of higher education or agencies regulating higher education:

Reviewed the residency requirements and practices of:

- PAC 10 institutions

- Big 12 institutions

- Selected institutions

- Penn State

- Ohio State

- Columbia

- Selected State Higher Education Coordinating Bodies

- Oregon

- Washington

- Texas

- Idaho

- California

- Arizona

- Selected Regional Accrediting Bodies

- Northwest Association of Colleges and Schools, Commission on Colleges

- North Central Association of Colleges and Schools, Higher Learning Commission

- Southern Association of Schools and Colleges, Commission on Colleges

Observed the following trends/practices:

- PAC 10/Big 12/Selected institutions

- Flexible residency requirements

- Specified number of terms - location, sequence flexible - 8

- Specified number of terms - on campus, not consecutive - 2

- Degree specific requirements

- Flexibility, specificity, consecutive terms - varies - 8

- Specified consecutive terms - in residence on campus - 5

- No residency requirements - 1

State Higher Education Coordinating Agencies

- None Specified - Institutional Option - 5

- Minimum Standards

- Flexible - 1

- Specified - contiguous, on-campus - 0

Regional Accrediting Bodies

Minimum Standards - 0
No requirements - Institutional Option - 3

Graduate Council

November 4, 2004 Minutes

Present: Pehrsson (co-chair), Steel (co-chair), Brown, Ciuffetti, Filtz, Francis, Koenig, Rettig, Rockey, Selker, Strickroth, Tadepalli, Unsworth

Absent: Bond, Francis, Pedersen, Waldschmidt

Guests: Carolyn Aldwin, Tammy Bray, Karen Hooker

1. Human Development and Family Studies Graduate Program Review

Prasad Tadepalli (Engineering), who chaired the Human Development and Family Studies (HDFS) graduate program review, introduced the review report. That report is attached to these minutes as Appendix 1.

Carolyn Aldwin, chair of the Department of Human Development and Family Sciences thanked the Graduate Council for its review and discussed the department's response. The written comments, which were prepared by Aldwin, Karen Hooker (past interim chair), and Anissa Zvonkovic (chair, HDFS Graduate Committee), are attached as Appendix 2.

Tammy Bray, dean of the College of Health and Human Sciences, said that she did not feel a need to add comments because of the excellent presentation by Aldwin.

Theresa Filtz (Pharmacy) asked whether the gender composition of the faculty (3 male faculty members and 11 female faculty members) is a point of concern. To fully address the need for a diverse faculty, each program should be diverse. Aldwin acknowledged the value of having male faculty and students, noting that, as a field becomes more heavily female, salaries tend to be lower. Brent Steel (Liberal Arts) noted that female faculty are good role models for students. HDFS faculty are heavily involved in collaboration in research and education across the campus and make an important contribution to many other programs, including his own.

John Selker (Agricultural Sciences) observed that the graduate student body was primarily doctoral and asked how they are incorporated into teaching. Are they used as graduate teaching assistants? Aldwin said that graduate students do much independent teaching. She does not think it is a good idea for graduate students with little experience to teach independently, but agreed that this was appropriate for more experienced graduate students. Graduate students with less experience should assist in courses and focus on their research. Currently there is one graduate teaching assistant for every 100 students enrolled in a course.

Aldwin asked how much fellowship support is available from the Graduate School? Mary Strickroth (Graduate School) said that the Graduate School does have some programs that provide tuition remission. There are also a limited number of fellowships available. These funds supplement funds that are provided by departments and programs. There are also minority scholarships for diversity recruitment.

Selker said that courses taught in the Statistics Department do not appear to have met the needs of departments, leading departments to create their own quantitative methods courses. He asked Aldwin to comment on the fact that her faculty are teaching quantitative method courses within her department. Aldwin said that undergraduate students need much work in statistics and mathematics. We need to get undergraduates up to speed in critical thinking, methods and observation. Statistics

taught by the Statistics Department does not meet the needs of our graduate students. We need more applied statistics, more computational support for both undergraduate and graduate students. It would be good to have more one-on-one statistical advising with students trained in statistics providing support. Karen Hooker (HDFS) observed that statistical programs are very complex. Students need support to learn how to use the programs. Aldwin added that statisticians speak a different language. Often this creates problems for our students. We are pleased to collaborate on research, but need our own teaching. Bray agreed, but said that all five departments in her college say the same thing. This raises a question about whether there should be an assessment center in her college.

Steel expressed concern with the wording in the draft report that said that social science research is not strong; he does not think this is an accurate statement.

Lynda Ciuffetti (Science) said that Filtz's recommendation on faculty diversity should be added to the report and that Steel's comments about social science research should lead to a revision. Selker moved that the report be approved with the two changes being made to the satisfaction of the Council. The report was approved with those two provisions. Steel and Filtz will give Tadeballi their comments. He will provide a revised draft to co-chairs Pehrsson and Steel, who will then approve the final draft on behalf of the Council. [Note: Appendix 1 is the draft after revision and final approval.]

2. 2004-05 Graduate Council Agenda

Bruce Rettig (Graduate School) asked the Council how it wished to proceed. Although Category I proposals, program review reports, follow-up reports and other items will appear later in the year, the only remaining agenda item for Fall term is the visit with Bill McCaughan, Dean of the Extended Campus. The Council reviewed a list of possible policy issues that it might review this year, including:

1. Reclassification of Post-Baccalaureate and Non-Degree Graduate Students
 2. Emerging 3-year bachelor's degrees in Europe
 3. Learning objectives for courses and programs
 4. Masters along the way
 5. 400-level courses on programs of study
 6. Course requirements for the PhD
 7. Program planning meeting for the PhD
 8. Remote participation by a student at meetings
 9. Time-to-degree guidelines
 10. Support courses across the university
- Council members discussed these issues and identified items 2, 6, and 10 as top priorities. All Council members should indicate their interests in doing additional research on these topics and should discuss other items that should be added to the list. Additional discussion will take place at the Council's next meeting (November 18, 2004).

In addition to these policy issues, Filtz notified the Council that Pharmacy has been working on a proposal for a joint DPHARM/PhD program and plans to bring it to the Council this year as an agenda item.

Appendix 1 GRADUATE COUNCIL PROGRAM REVIEW OF HUMAN DEVELOPMENT AND FAMILY STUDIES

1. Introduction

The graduate council conducted a review of the Human Development and Family Studies program on May 21, 2004. The review team included the following members, who are also the authors of this report.

Prasad Tadeballi, EECS, College of Engineering, Chair
Tony Collins, College of Pharmacy

Belinda King, ME, College of Engineering
Teresa Cooney, University of Missouri-Columbia; external academic peer reviewer
Stephan Wilson, University of Nevada; external academic reviewer

The self-study report of the HDFS Program was provided to the review committee well in advance before the site visit. The self-study was very thorough, analytical, and fairly complete. It included a lot of pertinent material presented in a readily digestible form. The review team appreciated the effort that went into producing it. It helped us understand the state of the department, the strengths of the faculty, their future plans, the workings of the graduate program, the research facilities, and some of the concerns of the students in the previous years.

The site visit on May 21 began with a breakfast meeting with Sally Francis, the dean of the graduate school, who introduced the committee members to each other and briefed us on the agenda of the day. We spent most of the rest of the day in Bates Hall. We first met with the interim department head, Karen Hooker, who detailed us on the history and the overall thrust of the department, followed by the Dean of the college, Tammy Bray, who briefed us on the budgetary issues and her vision for the department. We were then given a tour of the offices and facilities in Milam Hall and Bates Hall by Leslie Richards and Joanne Sorte. We then met with the graduate committee of the department, which consisted of Alan Acock, Megan McClelland, Leslie Richards, Sharon Rosenkoetter, Joanne Sorte, and Anisa Zvonkovic.

In the afternoon, we met with the graduate students to learn about the issues that concern them, followed by a meeting with the graduate faculty. We then had a brief meeting with Jack Higginbotham, the faculty liaison for research office, and Jeff McCubbin, the associate dean of the college. We finished the day with a meeting with Anisa Zvonkovic, the program administrator, and Kathryn Moore, the program secretary.

This review includes an Overview, followed by sections on Graduate Curriculum and Requirements, Faculty and Research Programs, Graduate Students, Facilities, and Administration.

2. Overview

The Human Development and Family Studies program is offered by the Human Development and Family Sciences Department. This interdisciplinary graduate program produces graduates that go on to assume university faculty positions as well as applied jobs. A key emphasis of the program is the study of human development and families in context; unlike traditional psychology with its emphasis on the individual, and sociology with its focus on social groups and the environment, this program's main concern is the interaction of individuals and their environments, and the bi-directional influences between them.

The roots of the department go back to 1888 as part of the Oregon State College. The department was part of the College of Home Economics for a long time. Since 1989, there have been a series of administrative changes both at the department and the college levels, culminating in the creation of the College of Health and Human Sciences in which the department is now housed (Figure 2). Since the last graduate school review in 1992, the department chair had changed twice. The current chair, Karen Hooker, is an interim chair. At the time of the review, a search is underway for a permanent head

Since 1992, the undergraduate population increased from about 250 students to 650 students. The graduate program currently enrolls about 30 to 35 students annually, of which about 2/3 are Ph.D. students. With only about 15 residential faculty, the ratio of students to faculty is 61:1 and is one of the highest in the country and in the university. In addition to the growth in the student body, the shifts in the administration have also been accompanied by growing emphasis on external funding and research. The department's external funding has increased to about 2M in the last 5 years. The emphasis on research has in turn led to a heightened emphasis on the Ph.D. students and a de-emphasis of the terminal Masters degree.

To serve the students more efficiently with a relatively small sized faculty, the department adopts several strategies. They have recently reorganized the graduate curriculum so that they do not need to offer many special topics courses at the graduate level, relying instead on an apprenticeship model to initiate students into specializations and research. They also actively seek Ph.D. students who have a good fit with the faculty in the department and discourage terminal Masters students. Finally, they are planning to focus their scholarly efforts on a small number of signature research areas - early childhood development and gerontology and attract high caliber faculty and students in these areas.

Most of the faculty members are active in research, publishing, and getting grants. Some of them are fellows in their respective professional societies and have won numerous awards. They serve on editorial boards of several journals and review for journals and conferences. The students are quite satisfied with the research

training and education they are receiving and are full of praise for their professors. They especially appreciate the warmth and concern the faculty members appear to show in their interactions with the students.

The dean is very supportive of the faculty and is keen on getting the department to the next level in research and prestige. She encourages and facilitates inter-departmental and inter-college collaborations among the faculty members, which are being pursued by several of them.

Overall, the HDFS program is well-run, has a highly dedicated team of faculty members, and students who are generally happy and satisfied with their graduate experience. While we make several recommendations that we think will improve the program even further, the department is generally headed in the right direction and has leaders and procedures in place that would provide the necessary guidance as and when it is needed.

3. Graduate Curriculum

3.1. The Core Curriculum

The graduate program curriculum in HDFS is designed to provide a strong foundation in the core areas of human development and family studies. The department offers formal classes covering theories of human development, the lifespan developmental framework, family theories and issues, research design, data management and manipulation, statistical analysis, qualitative methods, program and policy development, and evaluation models and methods.

All HDFS graduate students are required to complete a designated set of general courses covering theories, research, and methods relevant to the field of human development and family studies. Effort has been directed to developing classes and an overall curriculum that balances students' knowledge acquisition and understanding of individual development as well as family development and processes. This approach is consistent with the underlying philosophy of the interdisciplinary field of human development and family studies, wherein individual development is studied in context, with family considered one of the central contexts in individuals' lives, and families are studied with sensitivity to the individual development of their members. As a result of program requirements, the HDFS program produces graduate students whose training and knowledge base reflect the interdisciplinary nature of the field. (This is different from programs that immediately track students into fairly narrow individual development or family studies curricula.) This grounding should make the program's graduates highly competitive for faculty positions in human development and family studies programs around the country.

The breadth that is offered in the required substantive courses ensures that graduates have a solid and consistent knowledge base to scaffold the more advanced work they will do in years 3+ of their graduate study. The fact that the department does not offer more specialized content courses (e.g., focused specifically on families and aging, multicultural families, divorce and remarriage, cognitive development, social development) does not appear to be a problem although graduate students pine their relative absence. Discussions with faculty and graduate students indicated that more focused reading and specialized study occurs in conjunction with students developing their "emphasis areas" via research practicum experiences, assistantships, and independent directed readings with faculty. This approach has its benefits. For a relatively small graduate faculty like that in HDFS, this approach preserves teaching resources. The department can be sure that listed courses are offered on a regular basis given faculty teaching loads. Another benefit is that students are assured a strong foundation of both current and classic work in the field, with evolving "specialty" areas being covered more informally through individualized study between students and faculty with expertise in those areas. (We were told of a specialty course that was offered recently that didn't attain adequate enrollment. Therefore the 3 students opted to do a concentrated weekend seminar where they came together to study and discuss the topic. This is a good example of why offering very specialized courses in smaller departments usually is not a good use of resources.) Finally, having students acquire the more specialized content as they work closely with data on specific research projects may enhance their learning experience because they see first-hand how theory, a body of past empirical findings, and appropriate methodologies are integrated to develop new research questions and studies.

Another important decision has been to eliminate undergraduate-graduate mixed (4xx/5xx) courses, which may not provide a strong graduate experience. This is a commendable decision on a difficult problem, which other departments in the campus are grappling with and are unable to resolve.

3.2. Course Content

Review of a selection of course syllabi suggested that courses are demanding, thorough, and up-to-date. Required reading lists include key pieces from the recent literature, as well as classic pieces of work that have

shaped thinking in the discipline over the decades. Students are sure to develop a firm grasp of the "roots" of their discipline and a sense of disciplinary history, while also being up-to-date with current developments and central principles in the field. Aside from the readings list for the theory courses, which appropriately emphasize theoretical writings and conceptual pieces, the other courses include a good mix of theoretical and empirical work.

3.3. Writing Intensive Work

An impressive feature of the HDFS curriculum is inclusion of "writing intensive" work in at least one of the required courses. For example, in HDFS 548: Advanced Family Development, students learn the style and standards of published work in the discipline, and complete extensive writing to which they are given feedback on drafts and opportunities for revision. Surely, teaching such a course is labor intensive, but the payoff for HDFS faculty is that all students experience critical examination of their writing, and detailed, expert feedback early in their graduate training. Promoting strong writing skills in their graduate students from the start should save faculty endless hours spent editing students' writing (on thesis, dissertations) later on, and it should increase the chances that graduate research assistants will be able to contribute meaningfully to the development of research presentations and publications later in their training. Ultimately, as a result of this emphasis on writing, the program is more likely to produce graduates who can be successful writing and publishing their work, and attaining tenure in respected human development and family studies programs, or working in non-academic settings where skills in report and grant-writing are essential.

3.4. Research Methodology

The required research methodology sequence in HDFS is also a strength of its graduate program. The required three-course sequence that covers research design, data gathering methods, measurement, statistical approaches, and data management and manipulation is impressive. A benefit of integrating these topics and teaching them in lock-step fashion of increasing knowledge and statistical sophistication is that students are likely to develop solid understanding of the critical connections between research design, measurement, and statistical approaches. When research design and methods courses are offered separate from statistics courses (which many programs do), students are less able to grasp these connections. Additionally, the fact that students in the HDFS program not only hear and learn about various approaches but practice them with "real data" via the assignments in these courses reinforces their learning experience. Having students complete this requirement in their first year in the graduate program is also ideal. For many students it means that they can confront anxiety they have about math and statistics (which many social and behavioral science graduate students have) immediately, so they can move on to develop confidence with research. Early mastery of these skills also assures that the faculty will be able to hire fairly new graduate students as research assistants who can quickly contribute to their research activities without extensive additional training. More advanced research classes are available after students' first year. These classes, which have recently included qualitative methods, analysis of secondary data, and longitudinal data analysis, are becoming essential courses for graduates from HDFS doctoral programs who aspire to be successful family and development scholars.

The only methodological weakness spotted in the program materials was the absence of a course or extensive content and training in quantitative observational methods. Increasingly, the field is using multi-method approaches that include systematic observations in either natural or lab settings. Some training in this method would benefit the students.

3.5. Comprehensive Examination

The department has recently conducted a study on the practice of comprehensive examinations in the country, and moved from a closed-book comprehensive exam to an open book one. The questions for the exam are individualized to each student. This appears to be a good change in that the students may get a chance to think creatively rather than memorizing and regurgitating answers from the text book. The faculty might also consider other possibilities such as requiring a research paper. Given that there is a proscribed and strong core of requirements for all students, it may serve little good to "test" them on all of this material again once they've passed classes.

3.6. Thesis Requirement

Unlike many human development and family studies programs across the country, the department requires that all master's degree students in the HDFS graduate program complete a thesis. This requirement is another example of the rigorous research training that the HDFS graduate faculty has committed themselves

to providing for students. Given the faculty's decision to focus on doctoral training, the decision to require a master's thesis for all students is sound. The thesis writing process is a useful exercise for students to complete before advancing to doctoral work. It also is another way to ensure relatively early in the students' training that they have requisite analytic, methodological, and writing skills to make useful contributions to faculty research as graduate research assistants.

3.7. Internships

Internships are highly encouraged by HDFS. A sample listing of recent internship experiences completed by graduate students offered a wide array of options: designing curriculum for, working with, and assessing school readiness for special needs children; conducting a parenting education program; training in non-violent communication methods; working in state human services, such as foster care; working in an institutional setting with persons with Alzheimer's Disease; and working in a variety of child care settings. These types of applied assignments provide an opportunity for students to gain new competencies and put their acquired knowledge and skills to work. They also familiarize graduate students with settings outside of academia where they may eventually be able to secure jobs. For students with limited work histories, this exposure to the world of work is especially useful. Finally, insights gained in such applied experiences can expand the range of questions students pose as they embark on their own research programs.

3.8. Preparing HDFS Professionals

The HDFS Graduate Program provides an unmistakable message that students are to be engaged in the work of scholars and not merely studying the work of others. The adoption of a research apprenticeship and the push for students to participate not only in the formative work of research but also in planning, co-publishing, and co-presenting offer excellent examples that the program is designed to go beyond simple delivery of course content. In addition, the variety of research experiences (i.e., both from the required multiple research encounters in the apprenticeship and the types of assistantships in which students are placed) compliments the formal coursework. All of these elements should produce strong future HDFS faculty. It is less obvious, however, how the experiences may contribute to HDFS professionals in non-academic settings.

3.9. Recommendations

3.9.1. Establish at least one course on observational methods.

The absence of a course on observational methods represents a gap in the coverage of methodology. The department has state of the art facilities and equipment to offer such training in Bates Hall. This is an area that is growing in family and developmental research.

3.9.2. Encourage faculty to increase the research conducted in the Child Development Center (CDC).

The CDC is a remarkable facility that OSU can be proud of, but sadly is underutilized at this time. The faculty should be encouraged to take advantage of this facility for their research. Also, class assignments could require students to get experiences in the CDC which may, in turn, prompt them to pursue thesis or dissertation work there.

3.9.3. Consider Special Topics courses in the Signature Areas of scholarship.

While eliminating the Special Topics courses does address the faculty resource issue, it may, however, confound the development of a stream of students who focus on the signature areas for which the department wishes to become known. A small well-chosen set of these courses that highlight future directions in these signature areas could be a cost-efficient way of producing students who are well-prepared for research. Offering these courses in a well-paced and planned manner might allow students to plan for them in advance, and make the courses large enough to be viable.

3.9.4. Consider making comprehensive exams a more productive process for students.

For example, requiring students to produce a paper to be submitted for publication would help them to "jump start" their publishing record. Going through the submission and revision process is also an excellent professional development experience.

4. Graduate Students

4.1. Input Assessment

There are currently 34 students in the HDFS graduate program; 23 seeking the Ph.D.; 11 seeking the M.S. Most of the students are from west of the Rockies, but some are east coast and international students. According to the Self Study (pages 21 and 22), 9 of the 34 current students are international, 22 are caucasian, and 32 are female. The review team met with 14 current students (4 Ph.D. and 10 M.S., two males and the rest female.) The gender disparity is not perceived as an issue in the department, nor apparently in the HDFS field in general, in that there are no initiatives within the national HDFS community to promote male interest in HDFS. Some faculty felt that it is difficult to attract males to this profession because of the lower salaries. The flip-side of this argument is that the salaries may not rise unless males also join this profession.

The average GPA and GRE scores of admitted and rejected students over the last 3 years are reported on page 23 of the Self-Study. These data reflect the fact that GPA and GRE scores are considered a minor criteria in the admissions process. Taking 2003 as an example, the average GPA and GRE verbal scores are higher for rejected than admitted students. The admissions committee carefully considers the interests of the applicants in terms of how well they fit with the purpose of the graduate program and the interests of individual faculty. Faculty put tremendous pressure on themselves and their time to understand the possible match between students and the program. In some cases it is clear that the applicant has interests that do not fit, and the student would not be served by admission into the program. It is clear that the Graduate Committee continues to be highly involved in all aspects of graduate student decisions even after admission.

The program seems to have to continually deal with a misconception on the part of prospective students as to the nature of the graduate program. Many applicants were seeking an applied or clinical degree, neither of which is the emphasis of the HDFS graduate program. Being aware of this, the graduate faculty makes an effort to communicate to the prospective students that this is a research-oriented program. Despite this, one or two of the students whom we interviewed expressed disappointment in the scarcity of 'applied' classes offered.

The style of personal interaction and individual attention by faculty and staff in the admissions and recruiting process seems to be paying off. The students were generally impressed with their experiences during the applications process. The Program Secretary is familiar with faculty research areas, so can direct enquiries appropriately. Enquiries were forwarded to the appropriate person and dealt with in a timely fashion. This was in contrast to the students' experiences with programs at other institutions. At least one student considered this positive experience to be a major factor in deciding to accept the offer from OSU.

Although most students in the program are successful, the graduate faculty feel quite strongly that they are not able to attract the best students into the program. In the past 4 years, 2 to 6 students per year declined offers from the HDFS program (Self Study, page 23). Offers of higher stipends was cited as the main reason for students choosing to go elsewhere. Therefore it seems that an increase in GTA and GRA stipends would be required if the quality of incoming students is to be raised.

In the focus group discussions conducted in February 2001, and documented in the Self Study, the students expressed concern about working long hours and not having sufficient number of assistantships. However, the students with whom we had a conversation generally agreed that the level of financial support was adequate (although they are the ones that selected to attend OSU, despite the stipend levels.) For many, the availability of fellowships was considered to be a very important part of the financial package. Some students felt that they would not be able to make ends meet without a fellowship. Historically HDFS graduate students have been very successful in securing fellowship funds (Self Study, page 27). Unfortunately there has been a recent downward trend in the amount of scholarship money received by HDFS graduate students. Reasons for this that are cited in the Self Study (page 27) are the decline in the stock market and the merger of the College of Home Economics with the College of Health and Human Performance. Students and faculty identified health insurance for graduate assistants as an important issue that needs to be addressed.

4.2. Program Performance

The Graduate Program defines timely progress as moving toward completion of the degree within 2 years for the M.S., or 3 years for the Ph.D. In recent years the average time to completion has been about 3 years for the M.S. and about 4.5 years for the Ph.D. (Self Study, page 30). The recently approved curricular changes are designed to expedite completion of the degree by getting students involved in research projects earlier (Self Study, page 31).

The policy of using 'fit' as a major criterion for admission may well be a main reason for the high level of

student retention. Nearly all admitted students complete their degree (Self Study, page 30).

From the data the department has provided regarding the publications by graduate students, it appears that many students are actively involved in publishing in journals and making presentations in professional meetings. The students with whom we met were largely in agreement that the attendance at professional meetings is an essential part of their education and professional development. Unfortunately there have been several instances of students being unable to attend a meeting because of lack of funds. This is considered a serious problem among the students. Accordingly, we urge the department or the college to establish a stable source of travel funds.

On the subject of professional development, some students expressed a concern about opportunities for publishing their work. They suggested that the program develop a more formal system for guiding them through the writing and submission of manuscripts for peer-reviewed publication. As part of the recent curricular reform, the Graduate Faculty approved a mechanism that is designed to increase student involvement in research. An intensive research experience is expected to result in a paper submitted for publication (Self Study, page 31).

The program's focus on a solid theoretical and methods foundation is regarded by the students as a very positive aspect of the program. The students are very appreciative of the faculty for making themselves available and being responsive to requests for help. Also, the students were in general agreement that the special topics courses they had taken were very valuable to their graduate learning experience. They expressed disappointment that these courses are due to be discontinued because of the upcoming reorganization of the curriculum. The Graduate Program Administrator felt that this would not be a problem for future students because a similar learning experience will be provided by the 'apprenticeship' that will be in the new curriculum. There seems to be some miscommunication on this issue between the students and faculty. The students said they would like to have a meeting with the faculty to have the curricular changes explained to them.

The students identified a need for more computers with specialty software (Stata, MPlus) so that they can do their research more efficiently. As part of her drive to strengthen research throughout the college, the Dean is committed to establishing a computer lab for Health and Human Sciences graduate students (Self Study, page 16).

4.3. Outcome Assessment

Recent graduates from the HDFS program are almost all employed in professional positions in the field. The Self Study presents data for each year since 1997 (pages 46-48). Nineteen of the recent graduates are employed in academic institutions, six are employed in government agencies, nine are in private or non-profit organizations, eight are masters graduates who are now pursuing Ph.D. degrees, and two 2003 graduates are listed as seeking employment. The Graduate Faculty is considering the idea of organizing colloquia for alumni to discuss non-academic employment opportunities with current students.

4.4. Recommendations

4.4.1. Improve the quality, quantity, and the diversity of graduate student applicants.

The faculty is already trying to recruit at conferences by distributing publicity materials. Another idea is to send more graduate students to professional meetings at the regional and national level. Students can be good recruiters and can effectively "advertise" the program. Other ideas are to involve undergraduates in research and encourage them to go to graduate school, and networking with other strong undergraduate institutions to develop a feeder network. The issue of diversity is an important one and should not be ignored. The faculty can do more to encourage more male students rather than passively waiting for them to apply. While recruitment of males is likely hindered by the department's historical association with home economics, this should not be a permanent hindrance.

4.4.2. Set aside some funds to support graduate student travel to attend conferences.

Because this appears to be one of the major concerns for students, monies need to be set aside (at the department or college level) for students to travel to and participate in conferences. It may be possible to use some of the fellowship money to travel or seek additional support from the university. The students could "apply" for these on case by case basis. If the goal is to produce primarily Ph.D.s, these students must become involved from the start in professional organizations and meetings at the national level. They also need to be presenting at conferences. Professional networking is critical to identifying post-doc and job

opportunities and contacts. This effort will also pay dividends for program recruitment---graduate students (especially happy and satisfied ones, such as those in HDFS at OSU!) can be excellent recruiters.

4.4.3. Reconsider the exclusive emphasis on Ph.D.-bound students.

Given the high demand for terminal Masters students and their potential contributions to the state, it may be a little risky to focus exclusively on Ph.D. students. For example, is there a way to offer another option to an M.S. degree that is less "faculty time intensive" but serves the demand that appears to exist. One advantage of having a larger M.S. student population is that the department might then have enough students to offer some special topics courses and not rely entirely on one-on-one internships to educate their Ph.D. students in specialty areas. In the long run, a special topics course may be more efficient to deliver the content if there is a large enough class size.

If they stick with this decision of focus on Ph.D. preparation, then they need to ensure more RA positions and travel support, plus will have to recruit more broadly to get the strongest and best-prepared students. Printed materials (handbook, brochures) and the website should more clearly state the preference for doctoral training and discouragement of terminal master's degrees.

4.4.4. Improve the communication with the current and new graduate students.

Many of the changes and the rationale for the changes in the department are not well-understood by the graduate students. The department should involve student representatives in these discussions and have a student representative attend the faculty meetings. The faculty can also call for a general meeting of all students when big changes are ahead, and prepare them for the changes. Communication should also include clearly advertising on the department website and in program materials the preference for doctoral training and the strengths and focal areas of the department. The mechanism for changing advisors needs to be clarified in the handbook materials.

5. Graduate Faculty

5.1. Faculty Composition

At the time of the review, the HDFS department has 12 tenure track research faculty, 21 non-tenure faculty (with a total FTE of 15.82), and 8 extension service faculty. The tenure -track faculty come from some of the top schools in the nation including Pennsylvania State, University of Illinois at Urbana-Champaign, and Cornell University. 10 of the tenure-track faculty are women and 2 are men. The non-tenure faculty are predominantly from the western states including some OSU graduates. Given the heavy undergraduate enrollment of 700 students, the tenure-track faculty size is rather small. Table 12 of the Self Study report gives a tenure track faculty - student ratio of 1:61, substantially lower than other peer institutions (1:45 at University of Arizona and 1:18 at University of Missouri). Tenure-track faculty to graduate student ratio is on par with other schools at 1:3. However, the number of non-tenure faculty and their total FTE seems relatively large compared to the number of tenure-track faculty. The department is interviewing for a head of the department position and possibly another position this year. As the new budget model is implemented, the dean plans to increase the number of tenure track faculty positions, some of which will go to HDFS. Jack Higginbotham of the Research office explained that they will be ready to help with start-up money and research equipment for the new faculty.

5.2. Faculty Research

The graduate faculty is well-respected by their peers and do high quality research. The department houses the editorial office of the Journal of Marriage and Family, the leading journal in the family field. Many graduate faculty have achieved numerous awards and are fellows in their respective professional societies. About half of the graduate faculty consistently publish in the top developmental and family journals. Another third do so occasionally, mixed in with lower level journals. The rest do not publish a great deal in traditional academic journals.

Funding wise, about half of the HDFS are engaged in external funding. The funding sources include National Institutes of Health, US and Oregon Departments of Education and Health and Human Services. Many of these are state-type grants and, in the experience of the review team, may not result in the kind of information that is publishable in top academic journals. More often this kind of work is more specific to the state and presented in the form of official reports, policy recommendations, etc. As illustrated by some of the large federal grants, there are faculty members who are capable of getting them, and are well-motivated to do so. The amount and the number of external grants increased substantially in the last 3 years, and we

expect them to increase even more as the faculty grows larger and more experienced.

Rather than spreading themselves too thin in a number of areas to cover all stages of human development, the faculty is moving towards focusing on a small number of signature research areas - early childhood development and gerontology -- and build collaborations within these areas inside the department. The review team felt that this is an excellent strategy for a small department to use to gain a national reputation quickly. These areas are well-chosen and reflect the needs of the society. The faculty has made a difficult but strategic choice and should pursue their strategy vigorously.

The faculty members are also developing collaborations with members of other departments and colleges, especially in social sciences, which is encouraged by the dean. The faculty might also consider being on the lookout for faculty members in other colleges who might have some common interests with them. For example, faculty members from statistics and computer science might be interested in collaborating in projects that have a heavy data analysis component. Organizing and attending interdepartmental colloquiums and encouraging students to take courses in other departments might facilitate these collaborations. The students are generally satisfied with the advising and instruction they are getting from their graduate faculty. They all appreciate the warmth and friendliness of the faculty members.

5.3. Teaching and Mentoring

HDFS program has gained a reputation for excellence in teaching and their courses in research methodology have become very popular throughout the college and the university. The faculty appears to be actively engaged in making changes that improve the quality of education and research by the graduate students. They have recently reorganized the curriculum to encourage students to quickly get oriented towards doing research. They now require the first year students to take 1 credit of internship in each of the three quarters to learn about 3 different research areas. In the second year, they are expected to take 3 credits of internship in each of the quarters for doing research, all in the same area. This is an excellent way to get the students introduced to different research areas in their first year, and then encourage them to pursue one of the areas in depth in their second year. The faculty appears to be clearly motivated by their students' development and learning and continually trying to improve their graduate experience. It also appears that there is a great amount of collegiality both among the faculty and between the faculty and the students that makes the operation of the department quite enjoyable.

5.4. Recommendations

5.4.1. Develop ways of obtaining more federal grants that enable the faculty to do research publishable in top quality journals.

Pursue federal research dollars to bring even more visibility to the strong research being conducted in the department. This will provide more RA positions and possibly travel support for graduate students. Encouraging younger faculty to attend the grant-writing workshops is a good way to initiate them into the techniques of proposal writing. They might also benefit from active mentoring by the more experienced faculty.

5.4.2. Continue the efforts to develop signature research centers and seek collaborators outside the department and college.

The idea of focusing the research efforts in a small set of "signature areas" is an excellent one, given the limited resources available at OSU. The faculty might do well to use this as an opportunity to build campus-wide collaborations with other research-active departments, not only within the College of HHS but also throughout the university. One way to encourage this is by inviting people from other departments to give talks and have the faculty and students attend talks in other departments. Active collaborations with other departments and colleges that have common interests with HDFS would also increase the visibility of the department and raise their chances of success in getting grants. Finally, the faculty should also consider collaborating with their colleagues in other universities, which may be especially easy to do for young new faculty.

5.4.3. Try and get at least 2 more faculty slots not counting this year's hiring, while striving to improve the diversity.

The size of the research faculty is too small to serve the large undergraduate population and also meet the increased demands on research productivity. The department should try to move towards a better balance between the tenure-track and non-tenure track faculty. Also, reducing the teaching loads of graduate faculty

from 5-6 to 4-5 should be a priority to enable faculty to do more active research. The new budget model of the university should give this department a stronger hand in bargaining for more faculty positions. The department should try its best to recruit men and minorities.

6. Facilities

6.1. Space and Equipment

The Department is physically located in Milam and Bates Halls. The faculty feels that they need more space, although the review team was impressed with the amount and type of space that the department does have. The space in Milam is older, and used for faculty and graduate student offices and classrooms. The configuration of some of the office space is quite nice, providing office "groupings" with mini-conference areas that are co-located. Some of the space is certainly older, and the group does not inhabit consecutive floors of Milam. However, they have made good use of the space that they have. The space in Bates for the Child Development Center is no less than remarkable. Bates was constructed in 1991 with private donations. There are lab spaces where Head-Start type classes can be held, and observers can unobtrusively watch the interactions between pupils and teachers via a one-way mirror. There are areas where interviews can be held, small conference rooms, mixed with office space. Several externally funded projects have space allocated in Bates Hall. The Family Policy Program occupies much of the second floor of Bates.

One area in which the department is sorely lacking is in that of computer infrastructure. There are not enough computers, much less modern ones, software is outdated---MS Windows 98 was observed on one of the grad student computers---and the network likely needs to be upgraded. Given the strength in the department on methods and measurement, this hole is a bit incongruous. It appears that computer support is minimal.

6.2. Library Collections

The library collections are at level 3a-3c, which is adequate for advanced study or instructional support level (page 18, Self Study). With both M.S. and Ph.D. programs and many faculty doing cutting edge research, the collection is supposed to be at level 4, which is "research level."

6.3. Recommendations

6.3.1. Improve the computational infrastructure

Investment in computational resources---computers, software, network upgrade---is of paramount importance. It was one of the few areas in which the department appeared to fall short, and the students and faculty seem to feel the pinch. It would also be difficult to attract good students and faculty without state-of-the-art facilities and computer support for research. The department and the Dean should give a very high priority to this urgent need, and get help from the provost's office to establish a dedicated computer lab, and also upgrade the equipment in the offices of the faculty and graduate students.

6.3.2. Upgrade the library collection to research level

It is also important to improve the library collection to bring it to the "research level" (level 4). The faculty should investigate ways of subscribing to on-line journals and magazines which can achieve this without a huge price tag.

7. Administration

Karen Hooker has served for the last year as interim Department Head while they are searching for a new Head. At the time of the review, the department was optimistic that they had found a candidate, and the Dean seemed to be enthusiastic about recruiting this person. In the case that this position is not successfully filled this year, Karen said that she would be willing to serve for another year, although she was clearly not eager to do so. The Department appears to be quite tight and collegial, functioning synergistically, and we expect that they will be fine until a new head is found. They appear to be a healthy department, and the job of Department Head would likely be a nice one with such a group. We encourage the Dean to do what she can to recruit a dynamic head for this exciting department.

8. Summary of Findings and Recommendations

8.1. Summary

OSU's Human Development and Family Studies is a program with strong emphasis on Ph.D. level research. It has many faculty members who received numerous awards and are fellows in their respective disciplines. The curriculum is well-designed, thorough, and up-to-date. The program includes several innovative features such as mandatory internships, thesis requirement for all M.S. students, a required sequence in research methodology, and a newly introduced idea of rotating research internships for the incoming students. Over half of the grad faculty is involved with external funding. Approximately half of the grad faculty consistently publishes in top journals in their fields; another quarter occasionally does, although there is some variation in the quality (prestige) of their publication outlets.

The students are highly appreciative of their professors, the education and research experience they are getting, and the friendly, supportive, and warm atmosphere of the department. Most of the students receive either a teaching or research assistantship. They are actively engaged in research and publish in journals and conferences. The faculty and graduate student space is reasonable, and some of the facilities in Child Development Center and in Bates Hall are remarkable.

Most notable, however, is the conscientiousness of the faculty and their eagerness to improve things, which is apparent in the clarity, thoroughness, and transparency of their Self Study document, which should serve as a model for other programs. The efforts of the faculty are even more remarkable considering the fact that they do not have a permanent department head.

8.2. Recommendations

The recommendations are summarized below for convenience along with section references where they are further discussed.

1. Establish at least one course on observational methods [3.9.1].
2. Conduct more research in the Child Development Center (CDC) [3.9.2].
3. Consider Special Topics courses in the Signature Areas of scholarship [3.9.3].
4. Consider making comprehensive exams a more productive process for students [3.9.4].
5. Improve the quality, quantity, and the diversity of graduate student applicants [4.4.1].
6. Set aside some funds to support graduate student travel to attend conferences [4.4.2].
7. Reconsider the exclusive emphasis on Ph.D.-bound students [4.4.3].
8. Improve the communication with the current and new graduate students [4.4.4].
9. Develop ways of obtaining more federal grants that enable the faculty to do research publishable in top quality journals [5.4.1].
10. Continue the efforts to develop signature research centers and seek collaborators outside the department and college [5.4.2].
11. Try and get at least 2 more faculty slots not counting this year's hiring, while striving to improve the diversity [5.4.3].
12. Improve the computational infrastructure [6.3.1].
13. Upgrade the library collection to research level [6.3.2].

In closing, the review team is positively impressed with the HDFS program, and is unanimous in thinking that the department is headed towards greater glory. We wish them well as they seek a new leader and endeavor to improve their program and strengthen their reputation. We thank them for hosting us and answering our questions, often with copious documentation and always with a lot of patience.

Appendix 2

RESPONSE TO THE GRADUATE COUNCIL REVIEW

DEPARTMENT OF HUMAN DEVELOPMENT AND FAMILY SCIENCES

The HDFS graduate faculty met several times to discuss the Graduate Council's review of our program. We feel that it was a very favorable review, and agree with most, but not all, of the suggestions. The following is a distillation of our comments and responses.

1. Establish at least one course on observational methods.

There are two observational methods courses on campus at the graduate level, one in anthropology on ethnographic methods, and the other in sociology on qualitative sociology. Thus, our students do have access to these types of observational methods. However, we do feel that field observation of the type that could be done in the Child Development Center in HDFS would take a different slant, and we are considering the possibility of developing such a class. This would require the use of specific types of computer software such as NOLDIS, which are fairly expensive.

2. Conduct more research in the Child Development Center.

We agree with this suggestion, and have started two research projects this year there. The CDC (Joanne Sorte & Inge Daeschle) just received a major grant for Health in Action, which utilizes the setting to study physical activity and obesity in children. Further, Megan McClelland has received internal funding to do a study on social competence and achievement skills. Both projects have graduate and undergraduate student involvement.

3. Consider Special Topics courses in the signature areas of scholarship.

We agree that focusing special topics courses in our signature areas of research is a good idea. This endeavor has been aided by the hire of two new faculty, who will each be offering one specialty course. However, the Dean feels that rather than developing new courses, we could make more judicious use of existing special topics seminar courses. We are in the process of examining the graduate curriculum to determine the possibility of systematizing our offerings so that graduate students can plan their programs more efficiently.

4. Consider making comprehensive examinations a more productive process for students.

We have extensively studied this issue (see materials in appendix). Comprehensive exams as they are currently administered require students to integrate the material they have learned in coursework and through other experiences in the graduate program. We value the integrative nature of this exercise and feel that it is essential for an interdisciplinary program to provide an opportunity for students to integrate materials across disciplines. Indeed, we have been very impressed by our students' recent performances in this process.

5. Improve the quality, quantity, and diversity of graduate student applicants.

We have developed a strategic plan to improve recruitment, and have taken or plan to undertake several actions, including:

- Continue to do a coordinated recruitment with other HDFS type programs, in which top undergraduate students in all the programs are identified and are sent material about the program.
- In 2003, we developed new recruitment material and updated the web site.
- In 2003, we also recruited at the Western Psychological Association and the National Council on Family Relations annual meetings.
- We plan to recruit the social science McNair scholars from the spreadsheet sent to grad advisors this fall, via email and followed up with a brochure.
- We will also explore the possibility of identifying good diversity students through URISC.
- The new Department Chair has initiated a fund to help recruitment efforts.
- The new Department chair is actively working to raise assistantship levels and/or stipends and suggests

making multiple year assistantship offers to newly admitted students (e.g., 3 year for Ph.D. applicants), as a way to attract the best applicants in the pool.

<

6. Set aside some funds to support graduate student travel to attend conferences. The department has in the past supported graduate student travel using funds from their two endowed chairs. In the past two years, the Knudsen endowed chair has supported six graduate students' travel, and the Petersen chair has also supported six trips by students. However, these funds of necessity were targeted at specific topics (family policy and gerontology). The chair has set up a new Research and Travel Committee which will coordinate funds from the two endowed chairs, as well as the department, which will support graduate student travel and thesis research in all areas, as well as faculty travel and research.

7. Reconsider the exclusive emphasis on Ph.D. bound students.

The Graduate faculty members feel strongly that we have considered this issue at length. Given limited resources and the very large number of undergraduates we serve, we do not feel that it is in our best interests to emphasize the terminal M.S. degree, which would require us to provide graduate level training in research to individuals who will not be practicing researchers. Instead, we seek to follow recommendation 5 in order to improve our recruitment of top Ph.D. students.

8. Improve the communication with the current and new graduate students.

We have moved to systematize the mentorship of incoming graduate students in two ways. First, graduate student applicants to the program are contacted by a current graduate student in the program. We plan to extend this recruitment relationship into a mentorship once the student comes to campus. Second, we have instituted a research apprenticeship for first and second year students, which will systematically rotate students through the various research labs in the department. This will also provide a greater opportunity for mentorship of incoming students by senior students. Further, the students have undertaken on their own initiative to institute a weekly social hour.

9. Develop ways of obtaining more federal grants that enable the faculty to do research publishable in top quality journals.

HDFS faculty have generated between \$1.6 and \$1.8 million dollars in research funds during each of the past three years, from a wide variety of sources, including federal, state, and local agencies, as well as private foundations and donors. This provides substantial support for graduate students. Many of our faculty publish in top quality journals, and often graduate students are co-authors on these publications. Several faculty members have taken the grant writing workshop sponsored by Dean Tammy Bray. Of these, one written by Kate MacTavish was funded by NIH this year; Anisa Zvonkovic's was resubmitted this month. Several more faculty members participated in the workshop this summer and are preparing proposals. Further, it is anticipated that the ability to obtain federal grant funding is an important criterion for new hires.

10. Continue the efforts to develop signature research centers and seek collaborators outside the department and the College.

We have refined the HDFS signature areas to focus on healthy children, healthy families, and healthy aging. In line with this, we have submitted one university-wide initiative, the Center for Healthy Aging (Karen Hooker, director), and several of our faculty members are major collaborators in the Sustainable Rural Communities Initiative, both of which have made the final round. If funded, these Centers will provide significant infrastructure to enhance our collaboration within and across departments and colleges.

11. Try and get at least 2 more faculty slots, not counting this year's hiring.

We are working on this. We are in the process of searching for a new endowed chair in family policy, which we hope will strengthen the department on a national level, both in terms of grant funding and visibility. We are also negotiating with the Dean for a new senior position in healthy children to help spearhead the proposed Healthy Children Initiative, and hopefully we will be able to search on that in the next year. We will also develop plans to search for additional strategic positions, preferably in methods.

12. Improve the computational infrastructure.

We agree that this is sorely needed, and the department chair has appointed a committee to examine alternatives (Alan Acock, chair). We are investigating the possibility of installing a wireless network in the

graduate student office, which will allow them to use their own laptops (most of the students already have them). We are also looking into acquiring a server to maintain high level statistical software which will be linked to this wireless network, as well as the lan connections, so that both students and faculty will have access to these. We are exploring departmental, college, university, and external support for these initiatives.

13. Upgrade the library collection to research level.

We support this idea; however, current information from the library liaison indicates no books can be purchased. We are making better use of the resources the library offers, by enhancing our communication with the library liaison, and by systemizing the training our students get in using the library for searches, government documents.

Respectfully submitted,

Carolyn Aldwin	Karen Hooker	Anisa Zvonkovic

Graduate Council

October 21, 2004 Minutes

Present: Pehrsson (co-chair), Steel (co-chair), Bond, Brown, Ciuffetti, Filtz, Francis, Koenig, Pedersen, Rockey, Selker, Strickroth, Tadepalli, Waldschmidt

Absent: Rettig

Guests: Rich Shintaku, Sam Stern

1. College Student Services Administration (CSSA) Graduate Program Review

John Selker (Agricultural Sciences), chair of the review team, presented the report to the Council. Sam Stern, Dean of the School of Education, and Rich Shintaku, who has administrative responsibility for the CSSA program, were present. [The full report appears as Appendix 1 to these minutes.]

Selker praised the review team members for working so well together. The report was jointly written by the internal and external team members. The internal team was composed of John Selker (Bioengineering), Russell Karow (Crop and Soil Science), and Stephen Giovannoni (Molecular and Cellular Biology). The external team members were Susan R. Jones, from The Ohio State University, and Mike Segawa, from the University of Puget Sound.

Selker commented that both students and faculty were engaged in the review process. He reported that the review was generally positive. He described the program as dynamic, well known both regionally and nationally. He indicated that the program appears to be recovering from difficulties that existed five years ago. He stated that recruitment is strong and that there are 2.5 applicants for every one student slot filled. Students in the program are funded 100% via graduate assistantships. Female students of European ancestry currently dominate the student population. Faculty performance received high praise from several students who met with the review team.

Space is an ongoing concern and students are housed all over campus due to the nature of their graduate assistantships. This creates a loss in centrality within the program because there is no sense of convergence. It was recommended that a student lounge be created, preferably near the main CSSA office. The review team also noted that there was the lack of computers for student use.

In the review team's discussion with part time students, the issue of limited opportunities was raised. Selker stated that additional thought should be given to consider the best strategies for addressing the needs of this group before a concerted effort is made to increase their numbers.

Selker reported that faculty FTE must be increased. The program currently operates with only 1 faculty FTE (1 FTE 9-month; 0.25 FTE 12-month), and the program is delivered by adjunct faculty. Selker suggested that a minimum of two FTE is necessary to strengthen the program's viability and to reduce the program's dependence on any one individual. Selker reported that the addition of a GTA position would alleviate the administrative burden that currently exists by assuming many of the routine organizational activities involved in recruiting and assistantship management.

Selker stated that greater budget transparency is needed. It is not clear how dollar flow occurs within the School of Education. Faculty expressed the desire to know how dollars are being spent and to understand the justification for those decisions. There is a general sense that the CSSA program is a moneymaker and to some extent Selker suggests that the program is not adequately supported relative to its contributions. Students also felt the program was not getting its fair share of regular faculty FTE

and resources.

Faculty who participate in the CSSA program would like to resurrect the suspended Ph.D. program, but the team does not support this notion at this time, stressing that additional FTE will be required to take on that endeavor. Selker further reported that current Master's students are not prepared for the rigors of a Ph.D. program. Many of the adjunct faculty members do not have PhD degrees. However, 75% of the students polled expressed a desire to earn a doctoral degree, demonstrating some demand for the program.

Issues of curriculum were raised in the review report. The current offering of courses is based on adjunct faculty availability rather than need. Credit assignment is random and not related to a curricular core. The program is exploring the portfolio as an option for the culminating experience. Although the CSSA Program Competencies model does a good job of capturing the skills and knowledge needed for students to be successful in the workplace, further attention to the curriculum is warranted, such as:

- Outcomes assessment
- Impact of technology
- Public policy
- Increased visibility of program competencies

Sam Stern, Dean of the School of Education, shared his reaction to the review team document. He indicated that the CSSA program was housed in the Graduate School for nearly a decade. Approximately two years ago it was moved to the School of Education to reestablish its academic framework and to implement recommended strategic changes. The program is poised to make its first tenure track appointment in ten years.

Rich Shintaku, CSSA program director, responded to the review team report by stating that the program has national significance. He appreciates the excellent work done by the review team and welcomes the feedback. The self-study process enabled the program to identify many of the challenges mentioned by the review team.

Shintaku further stated that demand for the program will only increase. To address this demand, a tenure-track position is very important to the program's success. This past summer, he was involved in an extensive curriculum review. He concurs with the recommendations outlined in the review report and stated that the program is moving forward. The part-time student numbers help them access diversity. Currently, they have 10 part-time students in the program. Regarding diversity, they feel the profession should mirror the diversity of students and the diversity of the students should be reflected in curriculum and scholarships offered. Regarding the space issue, he agrees with the issues itemized in the report. He states that many of the classes have been pulled back to Education Hall 107. He asserts that the demand for a PhD program exists, and states that currently there is no doctoral program in CSSA available on the entire West Coast. He reports that they have increased the advising pool from 5 to 8.

Barbara Bond (Forestry) asked the program representatives why they are not considering a professional credential rather than a PhD degree program. Lynda Ciuffetti (Science) asked what resources would be forthcoming to support offering a doctoral degree. In response, Dean Stern indicated that there is an informal tension between an EdD vs. PhD. The perception is that the PhD is the preferred credential for which the students want access. He further stated that community colleges are the largest employer of CSSA grads and the PhD is recognized as carrying more prestige than the EdD.

The next agenda item was the report of the Graduate Council program review for Adult Education. Sam Stern and Rich Shintaku also represented the School of Education for this agenda item. The Graduate Council deferred action on the CSSA report until after the Adult Education review report was presented.

2. Adult Education Graduate Program Review

Elaine Pedersen (Health and Human Sciences), chair of the review team, presented the review team's report to the Graduate Council. Sam Stern, Dean of the School of Education, and Rich Shintaku, who has administrative responsibility for the program, were present. [The full report appears as Appendix 2 to these minutes.]

The internal review team was composed of Elaine Pedersen (Design and Human Environment) and

Brent Steel (Political Science). Susan Fish (Development Education Department, Chemeketa Community College) and Allison Rossett (Department of Educational Technology, San Diego State University) were the external reviewers.

Pedersen reported that students in the Adult Education program are exposed to a new approach to education that prepares them to apply their learning to real world situations. Students reported that they like the cohort program model, which consists of a 3-year part time master's program. Pedersen reported that there are two areas of professional preparation: 1) organizational development and training of specialists, and 2) master teaching in basic skills. The review team indicated that re-evaluation of the goals of each area is warranted. Although the master's program is professionally oriented and not designed as a research-based degree, statistics should be included as a required part of the curriculum.

AAACE standards give historical foundation and perspective to students. However, program supplementations by areas of specialization are called for. Twelve of the 45 credit hours are devoted to special topics. Consideration should be given to moving more credits to core courses.

Pedersen reported that three of the faculty are nearing retirement, including the program coordinator who is the only faculty member (nontenure track) with full program responsibility. It is imperative that at least one tenure/tenure track faculty member have full responsibility for the program.

The review team indicated that research productivity needs to be a priority in new faculty hires so that instructional quality can be enhanced.

Currently, the program requires that graduate applicants must be professionally employed to be considered for admission to the program. Pedersen stated that while this approach may be acceptable in the best of times, it is recommended that students be admitted even if not employed.

Pedersen reported that the program was delivered under an off-campus model. When the review team met with the students, the students reported that they wanted more contact with a librarian.

Sam Stern, Dean of the School of Education, reported that the Adult Education is a remarkable program with three distinct focuses: training and development, community colleges, and agencies dealing with adult students. Other major institutions are having trouble sustaining similar programs.

Rich Shintaku reported that he was very informed by the review team report, but that there were no real surprises. The curriculum has been under extensive review. The beauty of the cohort engagement is a tremendous common experience. They are moving towards hiring one more tenure track faculty member. The program is much more regional than national. Currently, the student population is a very "white" program and there is a great need for diversification. They are very excited to have enrolled their first full time students. Shintaku reported that it is no longer a requirement to be employed full time to be accepted into the program. He further reported that the Chemeketa facilities are better than those available at Oregon State University. Chemeketa is happy to have the program delivered at their location.

Barbara Bond inquired about the student demand for the two tracks currently being offered. Dean Stern reported that an industry standard is that 4% of employee payroll be spent on Education and Training programs. So, the marketplace is great.

Rich Shintaku indicated that the program's name is not reflective of its real emphasis and that they are considering a proposal to rename the Adult Education program.

Brent Steel (Liberal Arts) shared his perception that students in the program are very positive.

Selker reported that it was a delight to work with the School of Education. However, he expressed concerns regarding the absence of quantitative skills. How encouraged the program to consider how to produce lifetime learners.

Stern indicated that the School of Education is strategically working towards improving its qualitative methods curriculum, but there is no evident quick fix available.

Selker reported that in the years between 1995 and 2003, only 4% were students of color. He

recommended that the program representatives consider how diversity can be increased. Shintaku responded by saying that he is responsible for diversifying the student body in the program and is more intentional about attracting a greater diversity of students.

Stern reported that 44% of the African American students at OSU are in the School of Education and that 36% of the Latino population is in the School of Education.

Shintaku stated that due to its success, the School of Education's diversity plan is a model that is being examined by the administration at Oregon State University.

Dale Pehrsson (Education) expressed the Council's gratitude for Sam Stern and Rich Shintaku's participation in the discussion. After the guests departed, the Graduate Council engaged in ongoing discussion about both of the program review reports.

Brent Steel began the discussion by expressing concern about the number of adjunct faculty being used in both programs. Barbara Bond agreed, and stated that this should not be looked at as a weakness, since it is an enormously creative way to deliver a program. Bond also stated that the School of Education needs to be more transparent financially. Sally Francis (Graduate School) agreed that it may be viewed as a strength for CSSA, But she added that if the entire CSSA program is on the backs of volunteers, when do you work together as a faculty on core issues? She agreed that at least 2 tenure track positions are needed. Selker stated that the CSSA program may look like unstable from the outside, but the adjuncts have tremendous buy in. They want the PhD program. Ciuffetti stated that the adjuncts are devoted, committed, but any change equals a loss of program control. Pehrsson added that the coordinator is a non-tenured faculty member and the adjunct faculty are good. But a research position is lacking.

A motion made and accepted unanimously to approve the CSSA report as written.

The Council then engaged in conversation about the Adult Education program. Dan Brown (Council Student Member) asked why accessing technology off-hours presented a difficulty for the students. Pedersen responded that the problem is being off campus and getting faculty help when needed. Brown suggested that an academic help-desk could resolve the problem. Pehrsson stated that students don't know about the assistance that is currently available. Bond stated that student orientation should address these issues.

Selker stated that the Graduate Council should pull together key people to address the issue of quantitative methods across the campus. He added that the Council has heard this often enough and needs to be proactive. Bond agreed saying that the Council should set policies, not just react.

After the discussion ended, a motion was made and accepted unanimously to approve the report as written.

3. Minutes

Pehrsson stated that she was listed as both present and absent at the last meeting. She was absent. The motion was made and accepted unanimously to approve the minutes with the correction of Pehrsson's absence.

4. Other Business

Selker asked the Graduate Council members how to best prioritize the efforts of the Graduate Council. Bond indicated that she would like to see a list of topics put before the Council to discuss priorities. Ciuffetti cautioned that extensive footwork often is needed before topics can be put on the agenda. She suggested that a preliminary task force be established before the topic is brought to Council for discussion. Bond stated that she would like to see the Council set the agendas. Steel agreed that the Council should be more proactive. Bond added that she would like to see a Council-wide discussion on possible agenda items. Ciuffetti recommended that each member vote on their top three issues of importance. Tally them up and decide from there. Selker asked that the topic of discussion be put in print before the meetings so everyone can come prepared. He would like to see the Council being more strategic in their use of time.

1. Overview

This program review report was developed following the Oregon State University Policies and Procedures for Review of Graduate Programs. The review team was supplied an excellent self-study developed by the CSSA program, and held an entire day of interviews with faculty, students and staff of the program, as well as OSU administrators. The following report is divided into key programmatic areas, each of which contains numerous important observations and recommendations. The report ends with a summary of the central recommendations. This list is put at the end to emphasize that many of the key considerations for this program are matters of subtlety, so the recommendations should not be taken as a summary of the findings of the review panel.

In overview, the review panel found that the program was highly effective and fit well with the mission of OSU. OSU, the state, and region are very well served by this program.

2. Admissions and Recruiting

Overview

The CSSA program is well known regionally and visible nationally. The program typically has 50-70 applicants for the 25 annual openings. The program has sufficient applicants to allow for selection such that the incoming students are well prepared, motivated, and capable of success both in the program and upon completion. Increased recruitment, particularly from the Eastern US, would be very beneficial to improve the diversity of students in the program, which is currently dominated by female students of European ancestry. Essentially all of the graduate student slots are fully funded with assistantships, though they carry a significant workload. The demand for graduates is primarily from regional colleges and universities, with a limited number of graduates pursuing positions in community colleges.

Specific Observations

1. The CSSA is successfully filling its incoming student classes with motivated students who do well in the program and upon completion leave to find entry-level positions in student services at institutions of higher education.
2. The program typically reviews 50-70 applications for 25 positions, a favorable ratio.
3. The program's recruitment strategy is largely based on word-of-mouth and web site contact. The program is favorably represented at the American College Personnel Association (ACPA) web site, a factor that influences many students to apply. Students also reported favorably on the program's web site, indicating that information was easy to find. The absence of a GRE requirement was cited as a reason for applying by some students, suggesting that the program has avenues by which it could increase the quality of its incoming students if it decides to move in that direction.

4. The program is now on firm footing, after several years of considerable uncertainty seen by the out-of-state community, and thus stands to reap the benefits of its growing reputation in the years ahead by recruiting students on a national basis; presently, a high proportion of the students in the program are from West coast institutions.
5. Access to assistantships was cited by students as an important factor in their decision to enter the program. In general, students appeared to be satisfied with the assistantships, but they also expressed a desire for more options and better matching of the rigor of the assistantship with the abilities of the students.
6. The CSSA Student Orientation Handbook is a thorough and well-organized document that serves the program well, its only limitation being the need for revision with respect to the portfolio option.
7. Discussion among faculty and with current part time students raised concerns about the place for such students in the program. See "Operations - Part Time Students" for additional details.

In summary, recruitment is on the right track and the program should do well if it is able to consolidate its recent successes and continue to build its reputation. This is a vulnerable time for the program, because so much of recruiting success depends on word of mouth or the ACPA web site. We suggest that the best way to assure continued recruiting success is to address issues of long-term program stability.

3. Operations

The program has, in the past two year, been energized by a number of new elements of support, including more formalized secretarial support, a more focused department structure with a chair dedicated to the success of the program, and a strong message of support from the Dean.

Building and Space Issues

1. The new office location for the program and presence of an administrative assistant, though only with partial responsibility for the CSSA program, is seen as a benefit by all. Having a centralized and consistently available contact person is helpful for both student recruitment and retention. Students viewed this structure as very helpful.
2. Students would like a study lounge of their own for group projects and general gathering. The creation of such a space will be more important if a concerted effort is made to increase the number of part time students and students who are self-funded and don't have an assistantship home.
3. If a student lounge is created, we would recommend that it be near the main office or near the office of one of the regular departmental faculty to allow for casual contact with students. Such contact may seem like a small thing but experience in other situations suggests that it will help build the sense of belonging among students and hence increase student satisfaction.
4. Students would like to have a mailbox though many anticipate visiting it less than daily since they receive their mail in general at their assistantship locations. Dr. Shintaku indicated that mailboxes were already planned now that interior painting and building repair are nearly complete.
5. Current faculty mentioned that an effort was being made to increase the number of off-campus adjunct faculty. If this effort is successful, it will be essential to have some sort of shared office space that these people can use when on campus. Having this space near the main office so that limited secretarial support is available would be beneficial. Dean Stern stated that he recognized this need for the School as a whole as all units attempt to increase off-campus faculty involvement in programs.
6. Faculty and students had questions about the space occupied by the ELI program. It was not obvious to faculty or students that having this program in the building was beneficial. The relationship of ELI to the School of Education was not obvious. At a minimum, the faculty need to be made aware of the rationale for this program to be housed in what is viewed as School space.

The Building itself is problematic. While significant progress has been made in updating the facility, students felt both embarrassed by the building when showing it to others and short-changed as they see the facilities available to students in other programs. Less expensive actions such as making sure that all internal walls in rooms regularly occupied by program students are in good repair and that rooms have state-of-the art electronics would be helpful. Students commented that if all other factors are equal in a potential students' consideration of graduate study at OSU, the facility would be a negative point.

Part Time Students

1. Part time students were concerned about their place in the program. Historically the program has operated with a homogeneous cohort of full time students. Setting expectations and meeting the needs of such a cohort is much easier than meeting the needs of a diverse student group. Before a concerted effort is made to increase part time student numbers, additional thought must be given to working with

these students. Will part time students with or without an assistantship have the same experience as other students?

2. Students who are working part or full time jobs while taking coursework may not have the flexibility to take some classes if they are consistently offered in the same quarter and time each year. It would be a scheduling challenge, but could some classes alternate between terms in different years? Are distance education or on-line classes where students can complete 90% of the coursework independently an option?

Budgets

1. Greater budget transparency is needed. Dr. Shintaku is new in his position and thus is not clear on how dollar flow occurs within the School. This issue is of concern to regular and adjunct faculty as well. All faculty understand the need for the Dean to have dollar control at this point in time, but having some idea of how dollars are being spent and the justification for these expenditures would be helpful.
2. There is the general sense that the CSSA program, because of its low paid-faculty FTE and relatively high number of students, is a moneymaker and to some extent being taken advantage of by the School. Students also felt that the program was not getting its fair share of regular faculty FTE and resources in relation to student credit hours generated.
3. While current output (student credit hours and head count) in the program is very high due to the limited regular faculty FTE, the true cost to the University is much higher. We suggest that the Dean and Unit head take the time to do a rough calculation of the true operational cost of the program from a University perspective. How does the program look from an investment versus outputs point of view when true costs are considered? All indications are that returns would far outweigh inputs but doing the calculation would be informative as decision-making and program promotion tools.

Regular Faculty FTE

The program currently operates on 1 FTE (1 FTE 9-month; 0.25 FTE 12-month) of non-tenured faculty. This is insufficient for the current program.

1. Having tenure-track faculty as the base of this program will be essential for on-going program stability. All accounts suggest that Drs. White and Scheuermann are doing an excellent job in their positions. If Dean Stern concurs, seek waiver of searches for converting the White and Scheuermann positions to tenure-track, assistant professor positions.
2. Additional regular faculty FTE is needed in the program. The program is not sustainable at current FTE levels. As one adjunct faculty member commented, "superwoman" should not be part of anyone's job description. Drs. White and Scheuermann are doing an excellent job of trying to hold the program together but this will only happen as long as there is hope that conditions will improve. If this hope is lost, both have too many skills to not easily find jobs elsewhere. In our opinion, if either were to leave, the program would be "dead in the water" as those remaining could not possibly provide needed backup in class load.
3. Reviewing the needs and through discussion with participants, it is apparent that two FTE for the program would be a minimum for sustainable operation. Responsibilities of current faculty could then be more equally divided. This addition of faculty would allow only modest potential for program increase as current faculty seem to be working beyond a sustainable limit.
4. Sharing of part of a position with another unit in the School is an option suggested by Dean Stern and several others. While this option may be workable, having two full time faculty in CSSA would be preferable to give the needed support to adjunct faculty and students.
5. Adjunct faculty feel comfortable with the program because they see that there is some level of backup for them. If they absolutely cannot teach a class in a given term for some unforeseen reason, they know that others are there to cover for them. If there is any erosion in program support, this level of comfort will likely quickly disappear.
6. An immediate solution for additional program support is to provide state funding for a GTA position. A GTA could assume responsibility for many of the routine organizational activities involved in recruiting and assistantship management. This would free some time for current faculty for creative activity and scholarship. When additional regular faculty FTE is added to the unit, the maintenance of a GTA position would be useful both as a learning opportunity for students in this position as well as the opportunity to allow faculty to use their time most efficiently and effectively in program development and management versus doing repetitive tasks.
7. When asked to identify the single, highest priority resource need for CSSA, both faculty and students alike identified additional regular full time faculty FTE as this need.

Other Resource Issues

1. Additional resources are the key to the future of this program. Urgently needed is at least 1 FTE to shore up the existing program. There was considerable interest expressed to resurrect the now dormant a PhD program, as well as enthusiasm in adding additional undergraduate course offerings. The PhD program would require a minimum of 3 FTE devoted to the program. Additional FTE would be required to add further undergraduate-accessible courses. Having one of the best MS programs in the nation for student services preparation seems an appropriate objective at this time. Program expansion should be contingent on procurement of additional resources.
2. Access to computers with necessary software to create web sites or CDs are required since the popular portfolios option documents are expected to result in an electronic output. Part time students or those students who do not have an assistantship may not have access to needed computing capability. Even those students in assistantships may not be able to use or feel comfortable using resources in their place of work to do program projects.
3. Students indicated that having the choice to do the portfolio, exam, or thesis was very beneficial. Students arrive in the program from very different places in life and with different skill levels and having these options is useful. At the same time, having more options, some of which are very mentor-intensive, places an additional strain on faculty time.
4. Distance education classes take considerable time to develop and often take more faculty time per student to maintain than a regular class. Unless classes are designed such that they can be managed by a GTA, and a GTA is available to the program, while distance classes may create scheduling options for students, they could be a greater drain on existing faculty resources than current programming.
5. General support dollars are needed for:
 1. Professional development for adjunct faculty - one of the few needs/desires this valuable group of faculty identified.
 2. Thesis or portfolio development support for those students choosing these options. Assistance available to offset research costs, copy costs, etc. is would be appropriate, particularly since many of these efforts are directed toward practical issues of interest to the University. Perhaps this would be a viable opportunity for the focus of a development project with alumni.
 3. Professional meeting travel support for both students and faculty.
 4. GTA support for the program as mentioned above.
6. Training on grant writing is needed for faculty.

4. Advising

There were concerns about advising raised by students in the written materials provided to the review team but none raised in conversations with students. The five-person advising team that was created in the last year seems to be meeting student needs and is providing a level of quality control that may have been previously been lacking. Students also commented that much of the mentoring and advising for the program was done by their assistantship supervisors, peers, or others whom they knew who had been in the program. Several students commented that "you get out of the program what you put into it" in terms of creating the learning experience that they wanted. Advising did not seem to be an issue but an assessment of the new plan should be made after it has been in place for several years.

5. Curriculum

The curriculum of the College Student Services Administration (CSSA) program clearly reflects its current and stated focus on the development of practitioners. As currently structured, the curriculum is firmly rooted in the practice of student affairs, with an emphasis on functional areas of expertise in the profession and is largely delivered by practitioners in the student affairs division at Oregon State University. The specific comments and recommendations that follow are written with the program goal to become among "the best in the nation" in mind.

Content and Delivery of the curriculum

The content of the curriculum is appropriate for a practitioner-focused graduate program in higher education and student affairs. However, this emphasis on practice/functional areas in student affairs relegates some particularly important content areas (e.g., multicultural and diversity issues) to one credit electives. Several of the required core courses appear to be somewhat duplicative (e.g., 550, 551, 556, 557), all focusing on organization, administration, and practice of student affairs. Last, the logic behind what constitutes 3 credits vs. 1 credit courses is unclear to us. For example, a number of the courses on very specific functional areas (e.g., student activities) are 3 credit courses, while courses integral to an understanding of the context of higher education (e.g., multicultural and diversity issues, budgets and finance, international education) are only 1 credit courses. Further, an analysis of course syllabi (and corroborated by student comments) suggests

an uneven relationship between credit hours and course expectations/rigor. In light of our assessment, we suggest:

1. Re-examining the content of core and elective course requirements with consideration given to potential duplications, larger contextual issues in higher education and student affairs, and the relationship between content for one credit and three credit courses.
2. The number of one-credit course offerings seems labor intensive and an inefficient way to deliver the curriculum. We suggest streamlining the curriculum with fewer one credit course offerings (particularly in the core courses).
3. Given that the majority of the CSSA students are full-time with assistantships, the requirement of 3 practicum experiences may be excessive. The CAS standards only require "two distinct experiences," one of which may be the assistantship. Offering a seminar to go along with the practicum experience (a 5-6 credit offering?) may enable program faculty to deliver the practicum with a more theory-to-practice orientation and tie in with (or subsume) the 3-credit course currently entitled "Programs and Functions in College Student Services" (CSSA 551).
4. The curriculum is currently delivered nearly exclusively by adjunct instructors from the division of student affairs at Oregon State. While this is a strength of the program, it appears to also be a liability. All the students spoke very positively about the role these adjuncts played in their graduate preparation and about their dedication to their learning and success. However, we heard several adjuncts state that they were "taking time away" from teaching given the demands of their own full-time jobs. This puts the delivery of the curriculum in a somewhat precarious and unstable position. Further, many of the adjuncts do not have their PhD's which will have a greater impact on the program if re-establishing the doctoral program becomes a reality. This situation further reinforces the recommendation that at least one full-time tenure track faculty member be added to the CSSA program.

Portfolio/Research Issues

As "culminating" projects for the Master's degree in CSSA, we were impressed by the enthusiasm of the faculty for the introduction of the portfolio option and with the tenacity and initiative of the students who pursued the thesis option. However, student comments about both of these options and our own assessment produced the following observations/recommendations:

1. While very consistent with trends in professional practice, students appeared to be unclear, and in some cases quite anxious, about the portfolio process. Specific questions focused on the scope of the portfolio, what it should "look" like, the content and substance of the portfolio, and the presentation of the final product. We are confident that as more students select this option, greater clarity will come. However, we recommend that faculty provide guidance and a structure for this option. Particular attention should be given to the content of the portfolio to assure high quality and an integrative, comprehensive, culminating project rather than a summative description of course work completed.
2. Students working on the portfolio uniformly commented on the great amount of time required to complete the portfolio, without the corresponding credit hours typically associated with work on a thesis. We recommend that credit be associated with the portfolio development process.
3. A number of students are interested in, or are currently pursuing, the thesis option. As a hallmark of a strong master's program, this is commendable. However, it was also very clear that the students did not have the research skills to complete a thesis. The absence of research courses is also a limitation for those not pursuing the thesis as they do not learn how to be good consumers of the educational research they will read in scholarly journals. While we did not actually see a completed thesis, there appears to be an absence of research methodology courses (in addition to the one course on assessment) in the CSSA program which would provide students with the competencies to complete rigorous thesis research. We suggest that coursework must supplement the thesis experience and recommend that the thesis option be suspended until such courses are in place (or research courses in other departments in the school of education or university are identified as viable options for CSSA students).

Assistantships

The presence of assistantship opportunities is a critical part of the students' preparation. The emphasis on preparing practitioners dictates the necessity of having access to ample assistantship and internship offerings. Presently there appears to be a sufficient number of assistantships available but there is a concern that fewer assistantships are being offered rather than more. The increasing cost of assistantships is making them less attractive for employers, especially in comparison to the cost of professional staff.

We also heard in our meetings of instances where there was a lack of connection between the assistantship

experience/supervisor and the CSSA program/faculty. The result is, at times, a lack of complete integration of inside and outside classroom learning. When this occurs, students then express concerns about work load and the educational relevance of what they are doing.

In light of these observations, we make the following recommendations:

1. Increase the opportunities for assistantship supervisors and CSSA faculty to communicate about the educational experience of their shared students. Examples include assistantship site visits by faculty, supervisors sitting in on classroom presentations, course syllabi being shared with supervisors for their information and potentially feedback, regularly scheduled meetings between faculty and supervisors (on individual basis and/or collectively).
2. Further explore assistantship and internship opportunities beyond the Oregon State campus. These options may be more affordable at other institutions and increases the diversity of practical experiences available to the students.
3. Investigate whether or not assistantships may be used to satisfy the practicum requirement.

Competency Based Model

The CSSA Program Competencies model does a good job of capturing the skills and knowledge expected of successful Student Affairs practitioners. Students who are able to meet these competencies will be very well prepared to enter the field as entry level professionals and perform at a high level. There are a few additional topics that are worth considering for inclusion in the competency model. There are also questions as to how well the stated competencies are understood by the students and referred to by faculty in the development of their curriculum. The following recommendations speak to these issues:

1. Assessment and evaluation is an increasingly critical competency area in Student Affairs work. Students expressed some hesitancy in their awareness of student learning outcomes assessment. We would encourage the development of opportunities for students to further understand outcomes assessment (for example, National Survey of Student Engagement and accompanying Developing Effective Educational Practices work) in addition to techniques such as satisfaction surveys.
2. The impact of technology on service delivery and student development is a growing concern but not often addressed in preparation programs. The impact of technology on how students learn and develop community has yet to be fully explored in the field. The delivery of services has received more attention by practitioners but not fully embraced as a necessary body of knowledge by preparation programs. Coursework and/or practicum experience could be designed to address these issues.
3. Public policy is becoming more influential in the day-to-day lives of practitioners. Campus decision makers are asking practitioners at all levels for more feedback on potential public policy issues. Students who have an appreciation for the role public policy plays in higher education and Student Affairs work will increase their job satisfaction effectiveness.
4. Increasing the visibility of CSSA program competencies on a regular basis will increase students and faculty appreciation for them. Syllabi could easily reflect the specific program competencies to be addressed in the course. In reviewing course syllabi, it was not clear or obvious in all cases which of the program competencies the respective course would be address.
5. Once course syllabi list program competencies, it would be easy to track which competencies were being adequately addressed and those that might be in need of more attention.

Alternative Education Delivery Models

A number of ideas concerning new delivery models and partnerships were shared with the team. Most prominent in these discussions were distance learning, collaborations with our departments of the School of Education, and an undergraduate minor. While we are not recommending a specific course of action, we do have recommendations for how to think about these possibilities:

1. Distance education/e-campus could better meet the needs of part time students. However, it is not clear that an increased emphasis on part time students is the most strategic direction for the CSSA program. That is a decision that needs to be made before significant commitments to distance education would be wise.
2. Distance education is seen by some as a revenue generating source. This may be true but much investigation should be done before that conclusion could be verified. The human and hardware/software resources needed to implement e-campus in CSSA are unclear.
3. Collaborations between the CSSA program and the Community College Leadership Program (CCLP) should be possible if the CCLP program broadened their focus from executive management

development to include general graduate student preparation. As the CCLP is currently structured, it probably is not a viable partner on a consistent basis. However, we noted that student affairs staff at Oregon State enrolled in this program simply because it was the only way to obtain a doctoral degree in a related area at OSU. It is recommended that conversations be initiated with the CCLP and School of Education to determine if increased collaboration with CSSA and other Education departments is desirable and, if so, what adjustments are needed to make the collaboration an integral component of the CSSA program.

4. Another way of looking at this collaboration is to see if the CCLP would work as a model for CSSA to emulate. In other words, developing an executive leadership program targeted for the preparation of senior student affairs officers. Multi-year summer institutes are one way of formatting this experience and possibly generating revenue at less-than-peak times for faculty time commitments. This also could eventually become a starting point for a doctoral program in the future.
5. An undergraduate minor is a creative idea but as with the distance learning concept, and its commitment to part time students, there is a need for much more thorough discussion about who the CSSA program is to serve; and whether there exists an infrastructure to support such an initiative. A program that attempts to serve a multitude of student types requires a great amount of resources and at present those resources do not exist within CSSA. It may, however, be more realistic to think about undergraduate leadership development as an assistantship and/or practicum opportunity embedded within existing offices.

6. Faculty Performance and Professional activities

In general the evaluations of courses, advising, and faculty involvement was very good, with students uniformly pleased with the quality of the faculty (if not the quantity of CSSA faculty). While the faculty of CSSA officially lists 17 faculty, only one of these faculty has CSSA as her primary responsibility, so we restrict our discussion to Dr. White.

The students, faculty, and review team were uniformly impressed by the quality of leadership and energy provided by Dr. White. As discussed in numerous points above, Dr. White's list of responsibilities far exceeds what should be reasonably expected of a faculty member, leaving essentially no time for her professional development or scholarly effort. It seemed that this has caused some discontent, and we believe is not sustainable professionally. The dean's commitment to adding an additional FTE to CSSA should be used in significant measure to address this imbalance rather than to add to the program offerings per se.

7. Dormant PhD. Program

The PhD program of CSSA was described by the chair as "on the top of their minds," and by faculty as "needed and a big opportunity." Notably 75% of the current students we polled planned on seeking a PhD. Thus, although this review is of the current MS program, it is necessary to discuss the PhD program as it is a central component of the aspirations of the program, and thus will affect the MS program as this dream is attained.

The fundamental impediment to the delivery of the PhD program is lack of faculty FTE. We see that one additional FTE will be essential to bring the MS program to sustainability, and that at least one more FTE would be needed for the PhD program to be feasible.

The benefits of a PhD program could be numerous, some of which include: boost scholarly productivity; increase prominence of the program; satisfy what appears to be a large student demand; provide high-level students capable of presenting introductory level classes and assist in remote delivery. At the same time, the challenges presented by presenting a high-quality research-based PhD program are equally numerous. The cultural changes are most noteworthy: the current program is focused on practitioner skills with weakness in even supporting MS level thesis research. To turn the program into a research-driven model would require fundamental reshaping of the curriculum and each of the courses, including several research methods courses. If the program decided to focus on advance practitioners, modeling the program on the CCLP might be more manageable, though many of the benefits associated with a research based program would be lost.

In summary, the assumed goal of re-starting the PhD program has attraction, but must be framed within the context of the strategic mission of the program and how the achievement of that mission would be enhanced most effectively. It is not clear to us that the PhD program should be a central component of near term planning until the Dean has committed the resources, and the Program has clearly defined a path that will add strength rather than the possibility that such a change could substantially take away from the highly sought after program now in place.

8. Summary of Recommendations

Critical Issue:

- **◆ Increase faculty FTE from the current level of one non-tenured FTE to two tenure track to sustain the current program. No fewer than three tenure track FTE will be needed if the PhD program is to be reconstituted.**

Additional Issues:

- Enhance recruitment of minority and under represented students, as well as broadening overall recruiting strategy.
- With decreasing cost-effectiveness of stipends for on-campus positions, CSSA will need to pay more attention to finding new student funding opportunities and work to maintain those currently in the program.
- The portfolio option needs to be more rigorously/completely described so students are clear on expectations.
- As the number of part time students increases, the need for a student space for individual and group study increases. This space should include access to computer/software required to successfully complete a portfolio.
- The interior spaces used for teaching need significant improvement to cosmetic and furnishing aspects.
- As adjunct faculty are added, a dedicated space for them to meet with students and carry out program related business would be appropriate.
- The budget process for the program must be made transparent. What is the income, what is the cost to the School of Education, and what is the cost to the university?
- Given the desperately unsustainable current allocation of faculty FTE to the program, the hiring of a single graduate GTA is recommended immediately to carry out repetitive and routine tasks.
- Make course credit concomitant with the work required and the importance of the subject matter. Many 1 credit classes seem to be more appropriate as 3 credit, and visa versa.
- The many 1 credit classes seem inefficient use of teaching resources. As possible with the current heavy reliance on adjunct faculty, trim the overall number of classes. Make those remaining more comprehensive and/or provide greater depth.
- Include core coursework that addresses issue of the impact of technology; competency assessment; and the process of public policy development to better prepare the students for the contemporary issues they will face.
- Reduce practicum's from 3 to 2, with one possibly being the assistantship.
- Additional courses are needed to support competence in research methods for thesis students, and in the future, PhD students.
- Additional courses or course content is needed to support competency in assessment, impact of technology, and public policy.
- Employ Competency Based measures to define class objectives and evaluate performance.
- Consider remote delivery very carefully: it is not clear that this modality is most strategic for this program.
- A strategic plan matching resources to expectations is needed in the context of the ambitions for undergraduate and PhD offerings. Expectations should be clearly established by the Dean and program Chair to give clarity to the program staff on these significant long-term possibilities.

ADULT EDUCATION GRADUATE COUNCIL PROGRAM REVIEW 2004

Summary of Findings and Recommendations

The new School of Education has made a commendable commitment to Adult Education. For most academics adult learning and education usually means instruction in rooms with students and teachers. For the OSU Adult Education faculty, in keeping with their philosophy, their classrooms are not dominated by an expert behind a podium. They walk their talk and both urge and model a shared, collaborative and inductive approach to teaching and learning. The Adult Education program is highly valued by its faculty and students. The program is an essential part of the School and is a program for which the School is well known and

appreciated. The Dean has described the impact of this program as nothing short of remarkable.

The main goal of the program is to "train educators to be facilitators" and to more specifically train "expert facilitators for adult groups." Faculty and administrators concurred that the program is meeting this goal. Faculty are clearly models for excellence in teaching and learning. The faculty have worked hard to make the coursework "fit" the students' lives and career goals. Because this is a professional graduate degree program for currently employed students, the program offers courses on a "cohort" basis over a three year period. Courses are typically held once a month on a weekend to accommodate working students. The program is designed so that there is a careful sequence of the courses allowing the courses to build on one another. All students interviewed spoke of the exemplary nature of the teaching/learning process, advising, and mentoring in the program.

Graduates of the program are employed at community colleges, correctional facilities, universities, and as consultants. Their subject matter/positions include GED training, ESL-Workforce Development, and Continuing Education and Extended Learning.

Of the five O.S.U. faculty members involved in the program, only one, the program leader, has 100% responsibility within the program. This individual, along with several others, is nearing retirement. Though several faculty members have admirable research productivity, current research productivity relating to Adult Education is low.

The following suggestions and queries are offered from the perspective of both ensuring the program maintains its present quality level at the very least and at best it can enhance its quality level.

Suggestions and Queries:

Graduate Teaching, Curriculum, and Advising

- One area of frustration expressed by the students was the current technology class. This need for change was echoed in conversations with the faculty. Students had differing levels of expertise and their desires for change echoed those differences. Students suggested (and this has been echoed by the Adult Education outside reviewers) that the technology course could be offered as a six-week summer term course. Having a daily experience for a number of weeks may be a more logical learning mode for a skills-based course as compared to the current once a month delivery mode. In examining this part of the curriculum program faculty will want to consider the wide variety of student skills and learning needs and desires.
- According to the self study report there are two areas of professional preparation: organization development and training of specialists and instructional specialists and master teaching/trainers in basic skills. However, the current curriculum is cohort based, all students take the same courses in the same sequence. Program faculty need to consider the lack of consistency between the stated areas of emphasis and the singular emphasis of the curriculum and the employment needs of both the students and the workplace. This could include providing content concentrations in TESOL, math, reading, writing, organizational development, and so forth.
- The standards established by the Commission of Professors of Adult Education, American Association of Adult and Continuing Education (AAACE standards) do suggest that core areas of adult education need supplementation by areas of specialization. Currently, there is a strong emphasis on facilitation. Faculty are encouraged to think more broadly about the world to include topics of culture (in its broadest sense), globalism, and technology as specialization areas.
- Students learn about workplace culture in their first term with the program. However, a broader discussion of culture including issues of diversity, power, and privilege appears to be missing. There are a variety of methods by which these important elements could be infused into the curriculum. In reviewing the curriculum and planning for the future faculty are encouraged to consider this important curriculum area.
- Program faculty acknowledged that the AAACE curriculum standard regarding historical, philosophical, and sociological foundations was not met. Since the emphasis of the program is on workforce training, it is critical for students to see the movement of adult education from a social development perspective to one that emphasizes human capital.
- While the EdM is a professional degree and not a research degree for a thorough understanding of educational research (an AAACE curriculum standard) not only do students need to learn research methods, but they need to learn, at minimum, elementary statistical analysis. The current research component could be strengthened through the use of SAS or SPSS or another statistical program and hands-on experiences with statistical analysis.
- Twelve of the current 45 hours are ED 599 Special Topics classes. The special topics designator is

available for units to use when experimenting with their curriculum. It appears as if these courses have been taught and required for a number of years. Program faculty need to consider if requiring special topics courses hurts the credibility of the degree program.

Faculty and Research Programs

- Three of the faculty are nearing retirement. The program coordinator who is the only faculty member with full responsibility within the program is not tenured, nor tenure-track and is one of the individuals approaching retirement. The Department will need plans for recruiting for several positions. It is imperative that there be at least one tenure/tenure-track faculty member with full responsibilities for the program, preferably more than one. One of the reasons for the success of this program is the continuity, focus, and heart the current program leader has provided. It will be imperative that an equally strong leader be found.
- Oregon State University is a research extensive institution. Faculty need to be encouraged to develop Adult Education research projects. As faculty retire and new hires are made research productivity needs to be a priority. Even though the Adult Education program is a professional master's program (M.Ed.) the instructional quality of the program will be enhanced by having faculty who are actively engaged in research in the various program areas.
- Create a research agenda for adult education. Given current federal emphasis on adult education, this is an opportune time. Connection to NCSALL, the National Center for Adult Literacy (NCAL), or the Center for the Advancement of Adult Learning (CAAL) might facilitate this.
- Encourage students to present at conferences such as the O.S.U. Graduate Conference held each spring or to create conferences. This would re-enforce their research learning experiences.

Graduate Students

- The program would greatly benefit by a more diverse group of students (i.e., people of color). Perhaps partnering with other graduate programs and departments on campus to develop specializations attractive to people of color (e.g., Latinos) would help. Possible collaborators could be the new Contemporary Hispanics Studies degree, Ethnic Studies, Speech Communications, Sociology, or Anthropology. In addition, perhaps partnering with Chemeketa and other community colleges could help identify future diverse students (using the McNair Program as an example-grow your own).
- Should the requirement of current employment be used in bad economic times when a highly qualified student would like to enroll in the program? Could this requirement preclude students of color, who are more likely to be unemployed/underemployed in bad economic times? How about the question of pre-service students in general, should the program recruit highly motivated and qualified students with little professional experience?

Facilities

- It appears, from a discussion with the library liaison faculty member, that students are not taking advantage of the library resources available to them. Selected student projects could be designed to utilize specific library resources if the faculty consider this an important part of the students' graduate education. Additionally, both the librarian and the students suggested that she could work more frequently with them. Currently, the library orientation session is held early in the cohort program. Delaying the orientation and including strategies for doing research at a distance might contribute to more library usage.

Administration

- The Adult Education Program faculty may wish to consider ways in which the graduate students can become involved with program governance. This is important in any graduate program but appears particularly important in a program in which a number of its students will in their professional life be involved with educational administration at some level.

ADULT EDUCATION GRADUATE COUNCIL PROGRAM REVIEW 2004

Committee Process

On May 3, 2004, a Graduate Council review team visited the School of Education to conduct a full graduate program review of the M.Ed. in Adult Education. Team members were:

- Elaine Pedersen, College of Health and Human Sciences (Design and Human Environment), Chair

- Brent Steel, College of Liberal Arts (Political Science)
- Susan Fish, Director, Developmental Education Department, Chemeketa Community College
- Allison Rossett, Professor, Department of Educational Technology, San Diego State University

The Adult Education self-study report was provided to the review committee. This document was discussed by the internal (OSU) members of the review team at a pre-review meeting held April 26, 2004, at which time a request for additional supporting information was made of the Department chair, Rich Shintaku. These items were made available to the team members. The site visit provided the review committee an opportunity to meet with Sam Stern, Dean, School of Education; Rich Shintaku, Chair, Department of Adult Education and Higher Education Leadership; Don Prickel, lead faculty member for the program; and George Copa, Darlene Russ-Eft, Alex Sanchez, and Jessica White, Adult Education Program faculty. Meetings were arranged for the review committee to meet with graduate students representing several different cohort groups; a total of 7 graduate students were present. Several of the students were from outside of Corvallis but the majority were Corvallis based students. Reports from Susan Fish and Allison Rossett were forwarded to the review committee chair following the site visit and then shared with the on-site committee (See the Appendix). Individual O. S. U. committee members took responsibility for writing particular sections of the program review. All committee members have read the final version of the review for factual accuracy.

Overview

For most academics adult learning and education usually means instruction in rooms with students and teachers. For the OSU Adult Education faculty, in keeping with their philosophy, their classrooms are not dominated by an expert behind a podium. They walk their talk and both urge and model a shared, collaborative and inductive approach to teaching and learning.

The new School of Education has made a commendable commitment to Adult Education. Dean Sam Stern acknowledged the success of this program. He views it as an essential part of the School and praised the impact of this small program; current graduate students echoed his praise. As stated in the self study document, "The primary mission of the Adult Education program is to prepare work force education specialists to lead education and training programs in the work place, the community, and community colleges. There are two areas of emphasis in this program, depending on one's current and/or aspiring professional role and interest."

The self study document stated that the program prepares individuals as:

- Organization development and training specialists in business, industry, government, community agencies, and community college programs that provide training services to their own or other organizations, or
- Instructional specialists and master teacher/trainers in basic skills including English as a second language, work-related and/or content-based instruction for a diverse group of adult learners in business, community, and community college settings."

Graduate Teaching, Curriculum, and Advising

Teaching

According to the faculty and administrators of the Adult Education Program, the main goal of the program is to "train educators to be facilitators" and to more specifically train "expert facilitators for adult groups." Faculty and administrators all concurred that the program is doing an excellent job of attaining this goal. Similarly, the seven graduate students who participated in the Corvallis review all believed they received excellent ("life changing") training in the program. Faculty are clearly models for excellence in teaching and learning. Syllabi were generally complete and informative. When examining the results from the most recent Graduate Survey for Program Review for Adult Education, mean scores indicate "agreement" to "strong agreement" with the following statements:

- The department offers an adequate selection of graduate courses, sufficient for timely completion of a full graduate program.
- The graduate courses in the department are taught at an appropriate graduate level and are of sufficient rigor.
- The graduate teaching by faculty of the department is of appropriate quality.
- I am satisfied with the professional interaction with my major professor.

Because this is a professional graduate degree program for currently employed students, the program offers

courses on a "cohort" basis over a three year period. Courses are typically held once a month on a weekend to accommodate working students. The cohort is a critical element of the transformational learning that characterizes this program. In summary, graduate teaching in the Adult Education program is evaluated very highly by participating faculty, administrators, and students in the program.

Curriculum

A collaborative and inductive approach to teaching and learning is the learning model used in this program. The capstone experience of developing a portfolio is a valuable opportunity for students' reflection and synthesis of their learning experiences.

The faculty have worked very hard to make the coursework "fit" the students' lives and career goals. The program is designed so that there is a careful sequencing of the courses (the sequence is controlled by the cohort model). This allows the courses to build on one another. As the curriculum is currently designed all students take the same courses and, as discussed, in the same sequence. This intentionally designed curriculum extends the program into the community. The curriculum is process oriented and provides a personal model of education. Since the students come with work experience, and most are currently employed, to meet the internship requirement the students are required to find an internship outside of their current place of employment. This does not appear to be a problem; students expressed appreciation for this requirement.

There are seven curriculum standards established by the Commission of Professors of Adult Education, American Association of Adult and Continuing Education (AAACE standards). According to the self study document, the program meets or exceeds six of the seven standards. This includes curriculum on planning, delivery, and evaluation and formal courses on adult learning and development. Other standards include providing historical, philosophical, and sociological foundations which, according to the self study document, have not been met and an overview of educational research - writers of the self study discussed how this standard was met via an examination of "their practices and [the conducting of] an action research study that informs their own practice." Additionally, they take one research methods course. Students do not take a statistics course.

Advising

All students interviewed in Corvallis spoke of the exemplary nature of advising and mentoring in the program. It is readily apparent that the students and faculty in the program forge close and lasting relationships that contribute to a culture of trust and responsibility. There is an extensive orientation conducted for each new cohort, and there is a formal program evaluation conducted by students in the concluding year of each cohort. A suggestion made by the students that is somewhat related to this topic is the chance to serve on program committees (if appropriate). This suggestion was supported by responses to the Graduate Survey Program Review survey item "There is a well-established mechanism for regular graduate student participation in departmental decisions affecting students, when ever this is appropriate." Of course, this could be logistically very difficult given that many faculty live in Corvallis and the program is offered in Salem.

Suggestions and Queries Regarding Graduate Teaching, Curriculum, and Advising

- One area of frustration expressed by the students was the current technology class. This need for change was echoed in conversations with the faculty. Students had differing levels of expertise and their desires for change echoed those differences. Students suggested (and this has been echoed by the Adult Education outside reviewers) that the technology course could be offered as a six-week summer term course. Having a daily experience for a number of weeks may be a more logical learning mode for a skills-based course as compared to the current once a month delivery mode. In examining this part of the curriculum program faculty will want to consider the wide variety of student skills and learning needs and desires.
- According to the self study report there are two areas of professional preparation: organization development and training of specialists and instructional specialists and master teaching/trainers in basic skills. However, the current curriculum is cohort based, all students take the same courses in the same sequence. Program faculty need to consider the lack of consistency between the stated areas of emphasis and the singular emphasis of the curriculum and the employment needs of both the students and the workplace. This could include providing content concentrations in TESOL, math, reading, writing, organizational development, and so forth.
- The standards established by the Commission of Professors of Adult Education, American Association of Adult and Continuing Education (AAACE standards) do suggest that core areas of adult education need supplementation by areas of specialization. Currently, there is a strong emphasis on facilitation. Faculty are encouraged to think more broadly about the world to include topics of culture (in its broadest sense), globalism, and technology as specialization areas.

- Students learn about workplace culture in their first term with the program. However, a broader discussion of culture including issues of diversity, power, and privilege appears to be missing. There are a variety of methods by which these important elements could be infused into the curriculum. In reviewing the curriculum and planning for the future faculty are encouraged to consider this important curriculum area.
- Program faculty acknowledged that the AAACE curriculum standard regarding historical, philosophical, and sociological foundations was not met. Since the emphasis of the program is on workforce training, it is critical for students to see the movement of adult education from a social development perspective to one that emphasizes human capital.
- While the EdM is a professional degree and not a research degree for a thorough understanding of educational research (an AAACE curriculum standard) not only do students need to learn research methods, but they need to learn, at minimum, elementary statistical analysis. The current research component could be strengthened through the use of SAS or SPSS or another statistical program and hands-on experiences with statistical analysis.
- Twelve of the current 45 hours are ED 599 Special Topics classes. The special topics designator is available for units to use when experimenting with their curriculum. It appears as if these courses have been taught and required for a number of years. Program faculty need to consider if requiring special topics courses hurts the credibility of the degree program.

Faculty and Research Programs

Faculty

The faculty are very supportive of the graduate students. The faculty have worked together to create a very cohesive curriculum.

In the program's self study report it is stated: "The Adult Education faculty includes an intentional "blend" of full-time, tenure and non-tenure track faculty, as well as part-time faculty who are professionals in content-related fields." There are five full time School of Education faculty involved in the program. However it is difficult to determine the number of faculty per students given less than full-time participation in the program by four of the five O.S.U. faculty members. The AAACE standards state a ratio of 25 to 1; it is unclear whether this standard is being met. With three cohorts there should be three FTE; it appears as it there is only 2.45 FTE. See Table 1 for a breakdown of faculty responsibilities.

Table 1. Faculty Responsibilities in the Adult Education Program

Faculty	O.S.U.	Non O.S.U.	Appointment	% with program	Responsibilities	Courses
K. Chatfield		X	Instructional assistant		Teaching	ED 599 InformTech I, II
G. Copa	X		Tenured, Professor	50%	Teaching/advising	ED 533, ED 567
D. Prickel	X		Not tenure-track, Assistant Professor	100%	Program Coordinator, teaching/advising	ED 501, ED 510, ED 530, ED 531ED 539, ED 599 Issues in AdEd, ED 599 Facil. Learn, ED 599 Self-Org Learn.
D. Russ-Eft	X		Tenure-track, Assistant Professor	50%	Teaching/advising	ED 532, ED 553
A. Sanchez	X		Tenured, Associate Professor	35%	Teaching/advising	ED 533
J. Webster		X			Teaching	ED 530, ED 599 Self-Organized Learning
J. White	X		Instructor	Co-teaching 1 course	Teaching	ED 578
M. Willard		X			Teaching	ED 547

One faculty member has 100 percent responsibility with the program but is not a tenured or tenure track

faculty. This individual is the lead faculty member, the program director, and has full responsibility for 6 courses and team-teaches 2 courses. The remaining O.S.U. faculty, who are tenured or tenure-track, have varying responsibilities. There are three part time non-OSU adjunct faculty who have teaching responsibilities with Adult Education.

Affiliations with adjunct faculty allows the Department to increase its teaching capabilities. The participation of these individuals who hold professional positions in adult education in the community college system and as adult training professionals broadens the expertise available to students in the program.

Suggestions and Queries Regarding Faculty

- Three of the faculty are nearing retirement. The program coordinator who is the only faculty member with full responsibility within the program is not tenured, nor tenure-track and is one of the individuals approaching retirement. The Department will need plans for recruiting for several positions. It is imperative that there be at least one tenure/tenure-track faculty member with full responsibilities for the program, preferably more than one. One of the reasons for the success of this program is the continuity, focus, and heart the current program leader has provided. It will be imperative that an equally strong leader be found.

Faculty Research Productivity and Research Programs

According to the AAACE standards there should be "A record of contributions to scholarship relating to courses to be taught or to particular areas of theory, research and practice" (e.g. adult basic education, community development, human resource development). In the program's self study report the faculty felt that they marginally meet this standard.

While two faculty with partial responsibility in the Adult Education program have laudable research vitas, the majority of their work has been in areas outside of Adult Education. The remaining faculty who have responsibilities in the program have low, minimal, or no research activities.

There are no defined research programs or program areas in the department. Research is not part of the program's mission statement.

Suggestions and Queries Regarding Faculty Research Productivity and Research Programs

- Oregon State University is a research extensive institution. Faculty need to be encouraged to develop Adult Education research projects. As faculty retire and new hires are made research productivity needs to be a priority. Even though the Adult Education program is a professional master's program (Ed.M.) the instructional quality of the program will be enhanced by having faculty who are actively engaged in research in the various program areas.
- Create a research agenda for adult education. Given current federal emphasis on adult education, this is an opportune time. Connection to NCSALL, the National Center for Adult Literacy (NCAL), or the Center for the Advancement of Adult Learning (CAAL) might facilitate this.
- Encourage students to present at conferences such as the O.S.U. Graduate Conference held each spring or to create conferences. This would re-enforce their research learning experiences.

Graduate Students

Admissions requirements for the Adult Education program follow O. S. U. 's minimum standards of a 3.0 GPA in the last 90 quarter hours of undergraduate work and a bachelor's degree. The criteria used for admission include written and oral communication skills, demonstrated professional experience and employment, professional objectives, and committed career objectives related to the program. According to the program's self study, between 95 percent and 100 percent of applicants are admitted to the program. Demand for the program appears to be quite high and enrollments, when limited, are based on available classroom sizes available at Chemeketa Community College.

Between 1995 and 2003 the program had 228 students enrolled, which is an average of 28 students a year. Out of these students approximately 79 percent have been women (typical of such programs) and 4 percent have been people of color. We should note that almost all non-white students were admitted in 2002 and 2003, indicating an effort of the program to diversify their student population. However, perhaps a more aggressive and targeted effort could be made in the Salem area. The program estimates that the average age of students is between 35 and 40, also typical of professional degree programs in education and social science.

During the Graduate Council Program Review, we met with 7 graduate students in the program. All of the students were extremely positive about the program. More specifically, they praised the cohort system, the diversity of job experiences among fellow students, the strong social support in the program ("an incredible learning experience"), the excellent quality of the professors, the design of the curriculum (including the sequence and format of courses), the applied nature of the program, and the flexibility of the program, which allows students to design course projects for use in their own workplace. All of the students concurred with one student who commented the program had a "profound impact" on his life.

In terms of suggestions for improvement, the students identified the information technology course as needing a major overhaul. This is consistent with information provided to us by the department chair and program director before meeting with the students. Some of the problems identified with this course were: (1) it meets only once a month, which makes it difficult to develop the skills and expertise needed to fully learn the material-several students suggested an intensive format in the summer to alleviate this concern; (2) there were too many tutorials in the class-more "hands on" experience would be helpful; (3) the course needs more "cutting edge" web training; and (4), the skill levels of students are quite varied, with some students already skilled users of the software while other students had minimal experience-it was suggested that requiring some pre-requisites might help to bring all students to the same level before enrolling in the course.

All of the students believed that the current 45 credits of required courses should be maintained. However, after some probing a couple of students suggested that having some substantive options (e.g., information technology, ESL, distance education) might be appropriate-possibly as a minor area of study. Two courses of interest identified were in how to teach technology and how to teach electronic communication.

Other issues raised included: (1) more instruction from the library on how to research papers and conduct searches in the second year of the program ("it would be more useful in the second year when we are writing research papers than in the beginning of coursework"); (2) would like to be made aware of GTA/GRA possibilities on campus including a website where they could post their resumes for GTA consideration; (3) would like the opportunity to serve on program/department committees "if realistic;" (4) some would like the option of not putting their portfolios on line-it should be optional and not required; and (5), would like a program seminar series where students (and faculty?) could present their work.

When examining the most recent data from the Graduate Survey for Program Review, the overall results indicate student satisfaction with the program. The only items that received lower scores are expected given the off-campus nature of the program (i.e., "support equipment needed for my research is available to me in the department," "the quality and availability of departmental graduate student office space is adequate for my needs," and the various questions concerning GTAs, which are uncommon in professional graduate programs).

Graduates from the program are employed by county and state institutions as well as private firms. Positions include: Director of the Oregon Forestry Education Program; Instructor at Portland Community College in the Coffee Creek Correctional Facility; Coordinator of the ESL-Workforce Development, Mt. Hood Community College; Director of Continuing Education and Extended Learning at Lane Community College; Non-Credit Program Coordinator, Western Oregon State University; Department Chair, ABE/GED, Linn Benton Community College; Director of Workforce Development at Northwest College, Powell, Wyoming; and Consultant/Contract Work for Scappoose and Clackamas County Fire District 1.

Suggestions and Queries Regarding Graduate Students:

- The program would greatly benefit by a more diverse group of students (i.e., people of color). Perhaps partnering with other graduate programs and departments on campus to develop specializations attractive to people of color (e.g., Latinos) would help. Possible collaborators could be the new Contemporary Hispanics Studies degree, Ethnic Studies, Speech Communications, Sociology, or Anthropology. In addition, perhaps partnering with Chemeketa and other community colleges could help identify future diverse students (using the McNair Program as an example-grow your own).
- Should the requirement of current employment be used in bad economic times when a highly qualified student would like to enroll in the program? Could this requirement preclude students of color, who are more likely to be unemployed/underemployed in bad economic times? How about the question of pre-service students in general, should the program recruit highly motivated and qualified students with little professional experience?
- Students expressed interest in graduate assistants. Faculty could investigate what opportunities are currently available across campus for Adult Education students. In the future as new Adult Education faculty build their research programs, graduate research assistantships can be developed.

Facilities

Delivering instruction at a convenient location on weekends makes the program possible for students who are fully employed professionals and for students from across the state.

Students expressed support for the library facilities and particularly for the library liaison faculty member who travels to Salem to discuss library facilities.

Suggestions and Queries Regarding Facilities

- It appears from a discussion with the library liaison faculty member that students are not taking advantage of the library resources available to them. Selected student projects could be designed to utilize specific library resources. Additionally, both the librarian and the students suggested that she could work more frequently with them. Currently, the library orientation session is held early in the cohort program. Delaying the orientation and including strategies for doing research at a distance might contribute to more library usage.

Administration

Ultimate responsibility for leadership and administration in the Adult Education Master's Program rests with the Department Chair. The current Chair has held the position since 2003. There are three programs within the Department: Adult Education, College Student Services Administration, and Community College Leadership.

Currently, the Department faculty member who has 100% responsibility with the Adult Education program is the Program Leader. The entire Adult Education faculty is involved with the student admission process.

Department and Program meetings take place regularly. The School of Education Academic Affairs Committee supports the Department's curriculum development and academic administration efforts.

Given the current small size of the Adult Education faculty the current administrative structure appears to work relatively well for faculty and graduate students. The graduate students who visited with the review committee expressed their comfort with the current administrative structure, though they are not directly involved. However, they also expressed a desire and willingness to be involved in department governance.

Suggestions and Queries Regarding Administration

- The Adult Education Program faculty may wish to consider ways in which the graduate students can become involved with program governance. This is important in any graduate program but appears particularly important in a program in which a number of its students will in their professional life be involved with educational administration at some level.

Summary

The Dean of the new School of Education, the Department chair, the Adult Education Program leader and faculty along with the students all were unanimous in their praise for the program. In developing the self study the program faculty chose to use the AAACE standards. According to the Adult Education outside reviewers there are other standards that could have been used. Of the thirty AAACE standards, the self-study identified nine that were not met. Does this indicate a choice of the wrong standards or weaknesses in the program? In their continuing evaluation of the program, Adult Education faculty may wish to consider this question.

Appendix: Reports from Outside Reviewers

Report from Susan Fish, Ph.D., Director,

**Developmental Education Department
Chemeketa Community College
Salem, Oregon**

General

Commendations

The new School of Education has made an admirable commitment to Adult Education.

Students experience this as a very high quality program which transforms their learning and careers. Students speak often and with wonder at the increase in their own self efficacy.

The program has been responsive to changing needs in the field.

Concerns

The self-study (p.9) pointed out a concern about the availability of good professional opportunities for program graduates. One student summarized that concern when he declared that the only jobs available to him with this degree were ". . . with government."

When asked for their concerns about this graduate program, one student said, "It (the program) may or may not qualify me to teach?! Not sure anymore what this masters will do for me. . . ." Another said, "I'm not sure what I can do with degree."

One student in the survey commented that Adult Education is misleading as the program's title. It might also be a barrier to employment.

There was not much follow up information about graduates. We only had employment outcomes for 30 of the approximately 225 graduates in the ten years of the program. These were all very recent graduates, so any inference about whether or not the program is meeting its goals must be tentative. However, of the roughly half who reported, the largest number have become administrators rather than teachers. If this pattern holds for the full history of the program, there might be a mismatch between the curriculum and the students' career options and it 's to find out why.

The outcomes students describe seem to be primarily in affective: increased self-efficacy, strong collegial networks, etc. These outcomes certainly fit with the content and structure of the program, but are they the primary outcomes the for which the program is designed?

Of the thirty AAACE standards, the self-study identified nine that were not met. Does this indicate a choice of the wrong standards or weaknesses in the program?

Recommendations

One student recommended better advising: "An initial review that clearly defines the program and the career options available as a result of completing the program."

Complete the employer survey to find out not just how graduates have performed, but also what will get students the jobs they want. If teaching is a priority for students, likely employers need to be asked very specifically about what they need to see on a transcript. This is especially important for faculty positions at community colleges.

Create an advisory committee of potential employers and successful practitioners.

Recruit more diverse students by working with employers who have "grow your own" efforts and by making some kind of scholarship funding available through GTA or internship options.

Curriculum

Commendations

The faculty have worked very hard to make the coursework "fit" students' lives, and career goals and fit one another.

The careful sequence of the program (which is controlled by the cohort model) so that the courses build on one another.

The effort to attract students with more diverse discipline backgrounds seems to have been successful. These students have enriched the experience for the other students.

Students appreciated the requirement that they find internship outside their current place of employment.

Concerns

Is it possible that by making the curriculum generic enough (training and development and teaching and learning) to meet the needs of students whose goals are in workforce training and in adult basic skills, the program might be serving no one optimally?

Is the AAACE standard concerning research adequately met? This is an especially important outcome now because the federal Department of Education emphasizes in its funding applications evidence-based practice by which they mean experimental or quasi-experimental research.

The program needs to address cultural competence as an outcome. This is an element in the vision of the new School of Education, yet it is missing from this program. Whether this is addressed through infusion or specialization, it is absolutely necessary for successful teaching and training. While the "Workplace Culture" course has been well-accepted by students, it is too superficial for examining fundamental issues of diversity and it certainly does not address the issues of power and privilege that are so critical to adult education. Moreover, an ESL certificate option without a serious cultures class would further lack credibility.

One curriculum standard from AAACE which the program acknowledges not meeting is for historical, philosophical and sociological foundations. Given the emphasis on workforce training, it is critical for students to see the movement of adult education from a social development perspective to one that emphasizes human capital.

Many students expressed dissatisfaction with the technology classes.

Twelve of 45 hours are 599 classes. Does this hurt credibility of degree when employers or other graduate programs look at a transcript?

Recommendations

Provide opportunities for content concentrations in TESOL, math, reading, writing; organizational development, etc. This is especially crucial as OSU attempts to create a TESOL certificate. When Chemeketa has a precious opportunity to hire full-time ELL faculty, we want a master's in TESOL with courses that directly address methods, assessment, language structure, etc. Full time positions are too precious to waste on generalists who can teach, but not guide or develop curriculum. Our requirements are similar for ABE/GED-should we ever get to hire someone full-time again-we'll be looking for a reading, writing, or numeracy specialist.

AAACE standards actually suggest that the core areas of adult education should be supplemented by study in areas of specialty which may or may be taught in education.

Explore more specific standards for graduate programs from other professional organizations, e.g., Teachers of English to Speakers of Other Languages (TESOL), Commission on Adult Basic Education (COABE), American Society for Training and Development (ASTD).

The National Center for the Study of Adult Literacy and Learning (NCSALL) is currently looking at teacher certification requirements nationally, so there might be new information available on this topic.

Are the classes on self-organized learning and facilitating learning luxuries? Could concepts be incorporated into learning theories, instructional strategies, adult development, and workplace culture.

Expand and strengthen the research component to make sure students are good consumers of research. Using SAS or SPSS (or something more current) would give a hands-on technology experience as well as good experience with quantitative research.

Adult learning theory and adult development could be great opportunities to look at experience and perception from diverse perspectives. However, the current text for ED 578 is ethno-centric.

Establish prerequisite technology skills for students. This was a frequent recommendation from the student panel and student comments.

Reconsider the technology outcomes. Is web design really important or a function that is likely to be contracted out or accomplished by a single person in the organization. Focus on instructional technology-on-line course development and management, instructional and presentation software, distance delivery technologies, and classroom technology, e.g., ELMO.

Since so many students become administrators, provide an opportunity for coursework or internship around some key administrative functions like budget, personnel management, meetings, etc.

Update required textbooks. Only a few listed in the syllabi were published in this century.

Instruction

Commendations

Students were thrilled with the quality of the instruction they receive in the program. It is clear that faculty do an outstanding job of modeling student-centered and outcome-based teaching.

The syllabi were almost all very complete and informative. The addition of the COG charts was very useful in getting an overview courses.

Concerns

The technology class was the only one about which students complained and it seemed that the dissatisfaction was shared by all many students. Some students were disappointed that the content had not been "cutting edge" while others felt they had been able to learn enough because of the course schedule. Some students found the wide variety of student skills a barrier to the instruction.

Do the outcomes and student-centered emphases of this program cheat students of the things learned best through direct instruction (technology, methods) and the ability to use direct instruction in their own practice?

The only opportunity to design curriculum beyond the lesson level requires an outcome-based approach. It is also hard to visualize the quality of the students' assignments when there is not explicit tie to content.

Recommendations

See coursework and delivery for recommendations concerning the technology course.

Provide students with good models of direct instruction and require that they use them at least once in their projects.

Introduce students to other forms of curriculum organization and require that they use at least one in their projects.

Instructional delivery

Commendations

The cohort is a critical element of the transformational learning that characterizes this program. It contributes to students' ability to work in a team-centered environment by helping them feel a responsibility to both self and cohort. The diverse work backgrounds of cohort members provide alternate ways of seeing. to see how things are applicable.

Delivering instruction at a convenient location on weekends makes the program possible for students who are employed and for students from across the state.

The extensive use of Blackboard is a great way to help students become comfortable with technology they might need to use in their own teaching and training.

Concerns

Tight cohort programs like this one are always at risk of "cohort-think."

If the program allows or requires students to take courses in a specialty area, scheduling might become an issue.

Recommendations

Concentrate technology instruction in six-week summer term-as one student advised, "No one learned to ride a bike by doing it once a month."

Offer some classes on-line or through teleconferencing.

Outcome Measures

Commendations

The portfolio is a great opportunity for students to reflect and put things together.

Some of the courses (especially ED 553 and 533) use excellent performance tasks and assessment rubrics.

Concerns

Is the portfolio rigorous enough as a capstone project? It speaks to the program strengths, but not the weaknesses in real teaching and public communication.

Students are likely to assess their students' and trainees' performance in much smaller chunks than those modeled in the program. These kinds of performance tasks are often harder to create and assess.

The outcomes based design of the curriculum is one of its strengths, but it is weakened by the absence of performance (rather than writing) opportunities for students in settings where they can get feedback.

Recommendations

Provide more models and practice with the kind of assessment students are likely to use in their own practices.

Build teaching or training demonstrations into the internships and make sure that students get feedback from employers and OSU faculty.

Staff-faculty

Commendations

The faculty are very supportive of students. That was apparent in their own discussion of the program and in students' comments.

Faculty clearly have worked together to create a cohesive curriculum.

Concerns

Don's departure causes grave concern. Is he the only one who knows how the "system" works-both internally to the cohort and externally in community colleges, basic skills programs, and workplaces? While the continuing faculty have the expertise, do they or are they willing to take on the coordination that a cohort program like this requires? Someone needs to provide the continuity, focus and heart that Don has lavished

on this program.

While it is tempting to call for additional tenure track faculty, is it possible for faculty to coordinate a program like this and meet tenure requirements.

Except for Dr. Copa and Dr. Russ-Eft, there seems to be no evidence of recent scholarly research or publication.

The number of faculty per student is difficult to figure given the less than full-time contracts, e.g. Dr. Copa is 50% adult education , but 50% of what? Even assuming that these are all percentages of full-time faculty, it doesn't seem to meet the 25:1 ratio suggested by the standards, i.e., given three active cohorts of 25 students each, there should be three FTE faculty, but adding up all the percentages, we only find 2.45 FTE and that might be overstated.

There is no research agenda relating to adult education.

One student expressed concern about instruction from cohort members to following cohorts. Does that mean some instructors do not have doctoral degree?

Recommendations

Create more staff capacity by adding assistant professors. This would definitely open the possibility of specialization. Implementing recommendations from this review will take more capacity than the program currently has.

Create a research agenda for adult education. This might be an opportune time for this given the federal emphasis. Connection to NCSALL, the National Center for Adult Literacy (NCAL), or Center for the Advancement of Adult Learning (CAAL) might facilitate this.

Encourage students to present at conferences or create the conferences. This might help their attitudes about research.

Support (admin, library, etc.)

Commendations

The university library seems to be exceptionally helpful. Assigning a single librarian as liaison seems to work well.

Students are not experiencing difficulties with admission, business office, etc that distance learning students often do.

Concerns

Students are not taking advantage of the library resources available to them.

Recommendations

The librarian and some of the students suggested that she work more frequently and directly with them. Delay the orientation to the library and include strategies for doing research at a distance.

Create an information literacy outcome for the program.

**Report from Allison Rossett, Ph.D., Professor,
Department of Educational Technology
San Diego State University
San Diego, CA**

There is much to say that is positive about the program:

- In the view of the Dean, the program is a core offering that is an essential part of the School. It is a program for which the School is famous and appreciated. He described the impact of this small program as nothing short of remarkable. We heard that view seconded by students who also recognize that they are one of many who have enjoyed their education and gone forth to make a difference for adult learners.
- In the view of the students, the program is an extraordinary success. They recognize that it has a particular flavor and buy into an experience that is cohort based, flexible, supportive, emotional, personal and participative. The students we interviewed were passionately positive.
- Students complimented the program for the way that faculty "walk their talk." They were also keen on the systems approach taught and manifested in the program.
- They love the cohort. They cited many benefits and could name not a single detriment.
- Faculty are proud of their integrated curriculum and the way that the cohort extends them into the community.
- They mount an intentional curriculum, one that focuses on a process oriented and personal model of education.
- When faculty speak of adult learning and education, for now, for the most part, they mean instruction in rooms with students and teachers. Of course, in keeping with their philosophy, these rooms are not dominated by an expert behind a podium. A key part of their intentionality is to urge and model a shared, collaborative and inductive approach to teaching and learning.
- Faculty are keen on teaching and advising. They nurture strong and long relationships with students.
- Faculty were thoughtful about topics that concerned them: resources; demand that they cannot meet; weakness in the treatment and integration of technology; need to capitalize on other campus resources; need to update names of courses; and to include more research and empirical efforts in their and students academic lives.

There is also much to say about possibilities for improvement:

- Now, all students take the very same courses. This is convenient for the department and faculty, but does little to further the individuality that is also a cornerstone for the program. Students want and need more opportunity to follow specialized paths in English as a Second Language or Technical Training or Adult Basic Ed or Technology, for that matter.
- It is time for the program to select a limited number of core courses and then to meet students' needs for deeper skills that will enable them to be competitive in specialized roles in community colleges and beyond. Faculty appeared to be willing to move in this direction. I encourage them to think about certificates that integrate into their program in areas such as training and development, English as a Second Language, School Improvement, Basic Education, etc.
- As the program grows to meet demands, more students will be aspirants, not always practitioners. And isn't that as it should be? Why would a state supported program limit itself to people who are already employed? Seems to me to be the wrong criterion to set on admissions. I'm in favor of requiring some kind of experiences teaching or coaching adults, sure, but hope that they will consider opening up their view of potential candidates.
- The program proclaims that it is committed to developing people who will facilitate adult groups. Those are the words they use in print and in meetings. While that is a worthy goal, in my view, it is limited. What about direct instruction, which the literature reports is most potent for people with literacy and numeracy needs? What about independent and asynchronous learning? What about informal learning that isn't the least bit groupie?
- Adults, although social, of course, are also learning more independently via technology today. Think of all the individuals pursuing certifications online. Faculty admit that technology is an area of need in their program. This is true as a topic, say in facilitating independent learning or even communities of practice (yes, groups online), and as a way of delivering to their distant students. They use Blackboard now, and well. There is so much more that can be done.
- Perhaps this is an area that should be outsourced. With current resources, even resources that are improved as I would urge, I'm not sure that hiring a tenure track technology faculty member should be their first priority.

I am impressed with the faculty's willingness to move in the directions listed above. They were responsive to these issues, and had already been contemplating movement in these directions. Let's goose them. I worry that they are not sufficiently resourced to do what needs to be done.

There are many opportunities for them on campus and off. Currently, they are doing well as teachers and

program people with limited often non-tenure track resources. Imagine what they could do if the university decided to make a real commitment?

Graduate Council

October 7, 2004 Minutes

Present: Steel (Chair), Bond, Ciuffetti, Filtz, Fisk, Francis, Koenig, Pedersen, Rettig, Selker, Strickroth, Tadeballi, Waldschmidt

Absent: Pehrsson, Rockey

Guests: Shane Brown, Christian Matheis, Tom McClain, Hal Salwasser

1. Award Reception for Outstanding Graduate Student Teaching and Research

The Graduate Council hosted a reception for Shane Brown, this year's recipient of the Herbert F. Frolander Outstanding Teaching Assistant Award, and for Christian Matheis, Oregon State University's selection for competition in the WAGS/UMI Distinguished Master's Thesis competition. Oregon State University is allowed to submit only one thesis for this competition sponsored by the Western Association of Graduate Schools.

2. Introduction of new Council Members

Brent Steel welcomed the Council members to a new year of activities. He and Dale Pehrsson will co-chair the Council this year. New members include Theresa Filtz from the College of Pharmacy and Dan Rockey from the College of Veterinary Medicine. Dan Rockey was unable to attend this meeting. The representative from the College of Oceanic and Atmospheric Sciences has not been selected yet. Neither has the graduate student member been selected.

3. Committee Assignments

Assignments for each Council member were distributed. Council members were asked to report conflicts and needs to change assignments within two weeks.

Sally Francis (Graduate School) discussed program reviews briefly. She reminded Council members that each program is reviewed approximately once every ten years. A member of the Council chairs each review. Additional review team members may be other members of the Graduate Council or other members of the graduate faculty. In addition to faculty members, two external reviewers are included—one representing a peer institution and one representing a potential employer. Follow-up reviews typically take place two to three years after the initial review. The follow-up review team typically consists of two of the initial review team members.

Because the Category II committee included the person yet to be named from the College of Oceanic and Atmospheric Sciences and this is such a critical assignment, Barbara Bond (Forestry) agreed to serve on the Category II Subcommittee until the COAS council representative is identified for a maximum of two months.

Bond suggested that the Council should focus on graduate policy issues in addition to the work on program reviews, follow-up reviews, and Category I proposals. Bruce Rettig (Graduate School) said that Bill McCaughan and Andy Klein have agreed to visit with the Council about the nature of distance delivered graduate education and graduate policies, such as the doctoral residency requirement. Another topic that was identified last year was the question of learning outcomes: how to improve campus understanding of learning outcomes in courses and how to assure learning outcomes for degrees.

4. IV. Wood Science and Engineering Graduate Program Review

Hal Koenig (Business) presented the findings and recommendations of the review team. These follow. The remainder of the report is attached as Appendix 1.

Findings:

Overall, the Graduate Council Review Team is pleased with the Department of Wood Science & Engineering's (WS&E) graduate program. The department has a solid research focus and culture that is appropriate to the number of graduate students in the program. As Department Head, Tom McLain has shown an excellent sense for where the industry is heading and he has found the resources to make strategic hires to effectively position his department for the future.

Recommendations:

- An effort was underway to hire a faculty member in composites - we do not need to tell the Department about the importance of this area in WS&E, but we encourage them to make this appointment a reality.
- Even out graduate student committee workload for faculty; some faculty are advising as many as 4-5 graduate students and others as few as one graduate student. The underlying issue is the time that the major professor can spend with each student.
- While having "real" faculty member in front of a class is great, doctoral students should be given teaching opportunities - determine how this can best happen.
- In an exit survey of students who graduated between 2000 and 2003, only six of thirteen stated that they would start over with the "same major," and only seven of thirteen said they would start over at the "same university." This needs to be investigated.
- It is hard for graduate students with a WS&E undergraduate degree to find "new" course work (i.e. courses that were not required as part of their undergraduate program of study). How can the department maintain rigor at both the undergraduate and graduate level?
- If a plan is not in the works for wireless access to computer networks in Richardson Hall, work with the College to make this happen.
- Students expressed concerns about student fees and the cost of insurance - how can the Department help with these issues?

Tom McLain, chair of the Department of Wood Science and Engineering, said that the review report included no surprises. The department is aware of, concerned with, and currently working on all the issues identified in the report. He agreed with the statement about the need for more staffing in the area of wood composites. They hired a new faculty member, who began work in this area on September 1, 2004. Applicants for the endowed chair position are currently being interviewed.

The issue of graduate students wishing to teach is a continuing challenge. The College of Forestry receives very little money through the general education budget. None of that money is available to support graduate teaching assistants. The department is soft-money driven. Although students routinely teach lab sessions, teaching in classroom settings beyond some guest lectures is rare. Faculty are not willing to give up their teaching assignments.

The number of graduate students recruited from the department's undergraduate classes is small because the job market is so good for students with a BS in wood science and technology. If more students who either majored or minored in this area as undergraduates continued for a graduate degree, the Department's challenge to provide new subject matter content for graduate students would be even greater. The department is working on developing stand alone 5xx courses.

McLain was puzzled by the results of the 2000 - 2003 graduate exit survey. During that time period, the department graduated 33 MS and Ph.D. students. He personally interviews each completing graduate student; and the feedback he has received is at odds with the results of the graduate school exit survey. In response to questions about whether he was asking the right questions, he indicated that the students are routinely frank in their answers and all conversations are confidential. He will work to develop more probing questions.

Hal Salwasser, Dean of the College of Forestry, said that he also was surprised by the 2000 - 2003 Graduate School exit survey. The departmental perception is that the students, on the whole, are quite satisfied. The diversity of the faculty is important to him and he continually works to promote it. He is disappointed in the low numbers of faculty research publications, but hopes that the faculty who were recently hired will improve the numbers.

Wood Science is a relatively small program university-wise, but has global importance. Worldwide demand for wood fiber is increasing at the same time that forest harvests are decreasing. Dean Salwasser would be more comfortable if the department was larger and the faculty published more scholarly work.

Lynda Ciuffetti (Science) said that the Department is fortunate to already be replacing some of its faculty. She asked for clarification of the fact that some faculty members direct more graduate students than other faculty. In response to her question about whether this is partly because some areas of study are more popular than others, McLain said that was true. She also asked for clarification of the statement that there was an inadequate amount of new courses available to graduate students coming from the OSU undergraduate programs. Koenig said that this was a slash course issue. Many of the courses are offered as 4XX/5XX. Continuing graduate students do not want to repeat a 4XX course with little or no additional learning involved. Francis said that the concern about slash courses is often voiced by graduate students and is not specific to this department. Ciuffetti asked why, if the department is able to employ students to teach laboratory sections, they cannot fund graduate teaching assistants. Could opportunities be offered to teach as part of the professional development curriculum for doctoral students?

John Selker (Agricultural Sciences) expressed concern about the exit survey responses. The remarks indicate some dissatisfaction, but no specific issues are identified. He asked what opportunities graduate students have to contribute toward departmental governance. McLain said that graduate students serve on the Graduate Affairs Committee and they are involved in both recruitment and curriculum. The small size of the department (only 35 graduate students) makes this a close-knit group; the opinions of the students are generally well known. This is why the dissatisfaction expressed on the exit survey came as such a surprise. Many of the students are enrolled as dual majors with Wood Science and another discipline. The comments from the feeder programs have been positive. In response to the suggestion that McLain include questions probing for negative comments and suggestions for change, he responded that he does this now.

Bond asked whether the department typically conducts anonymous surveys after students complete the program. McLain said that his exit interviews are not anonymous, but that the Graduate School Exit Survey is anonymous. Francis said that departments should encourage graduate students to fill out the exit survey to increase the response rates.

Selker explained that the Department of Bioresource Engineering requires its students to develop a teaching model as part of their curriculum. This is an important responsibility for a unit that places many graduates in teaching positions at other universities. He recommended a greater effort on the part of Wood Science and Engineering to provide teaching opportunities for graduate students. McLain said that the Council's review report will provide an opening for more conversation among faculty on this point. He agreed that there is a need to deal more directly with the issue.

After McLain and Salwasser left the meeting, Ciuffetti asked why the department does not have funding for graduate teaching assistants. Bond said that the College of Forestry has a very small amount of teaching FTE. Forestry is almost a self-supporting entity. Francis said that it is the choice of the college to put their state general education money funds into faculty appointments rather than teaching assistants and Forestry is constrained by limited General and Education funds.

Selker concluded that the program review report was done very well and congratulated the review team on a job well done. The review report was accepted as written.

Graduate Council's Program Review of the Graduate Program
Department of Wood Science & Engineering
College of Forestry

Program Review

Committee Process

The Wood Science & Engineering Department underwent a Graduate Council Program Review on March 8th, 2004. Members of the Graduate Council Review Committee were:

- Hal Koenig, PhD, Committee Chair (College of Business)
- Peter Bottomley, PhD, (Department Chair, Microbiology)
- David Sillars, PhD, (Construction and Engineering Management)
- Donald Bender, PhD, external reviewer from the CSREES team (Director and Weyerhaeuser Professor, Wood Materials and Engineering Laboratory, Washington State University)

As part of the review process, a self-study report was prepared for the Program Review Committee. The report was delivered to the committee members two weeks prior to the review. The internal members of the committee met with Dr. Sally Francis, Dean of the Graduate School to discuss the process and address any questions from the committee. The self-study report, relevant to graduate education, was a compilation of data covering faculty participation in college and departmental committees, graduate student enrollment and degrees conferred by year, faculty FTE allocations including teaching assignments, committee assignments, awards and offices, grants, contracts, cooperative agreements and other sources of external funds, current graduate student funding, department course reaction survey results, sources of funds for the department, research output by faculty members, theses and professional papers by recent graduate students, degree requirements, course offerings, strategic goals and objectives (dated November 2003), information on new initiatives, inventory of classrooms, offices, and laboratories, Graduate School student surveys, Wood Science & Engineering graduate placement, and the graduate handbook (Graduate Studies in Wood Science). Formal presentations were part of the review, during which the Department Head and various faculty members discussed the working of the department.

This review was concurrent with a departmental review by the Cooperative States Research, Education, and Extension Service (CSREES). Members of the CSREES team were:

- Catalino Blanche, PhD, Team Leader (National Program Leader - Forest Biology USDA/CSREES/NRE)
- Donald Bender, PhD (Director and Weyerhaeuser Distinguished Professor, Wood Materials and Engineering Laboratory, Washington State University)
- Michael Kocurek, PhD (Department Head, Wood and Paper Science, North Carolina State University)
- Marie-Pierre Laborie, PhD (Department of Civil and Environmental Engineering, Washington State University)
- Tor Schultz, PhD (Department of Forest Products, Mississippi State University)

During the review, both teams met with the College Executive Team (Scott Reed, Executive Associate Dean; Becky Johnson, Associate Dean; Steve Hobbs, Associate Dean), departmental faculty, staff and graduate students of the Department of Wood Science & Engineering. A tour of the facilities in Richardson Hall was conducted by Department Head Tom McLain.

The Graduate Council Review Committee met with Dr. Bender following Monday's schedule of presentations and received his comments on the program. Dr. Bender also agreed to review our report and add comments to provide a wood science perspective. On March 10th, the CSREES team presented their exit report to the College of Forestry Executive Team, University Administrators, and Wood Science & Engineering faculty and staff.

Background of the Department of Wood Science & Technology

An historic overview of the Department of Wood Science & Engineering is provided in the self-study report. The department was initially known as Forest Products, and research and teaching (both undergraduate and graduate) in this area has been part of Oregon State and the College of Forestry since lumber manufacture became a major curriculum again in 1927. A research program in wood preservation began in 1927. A PhD program was initiated in 1964. An active Extension program was begun in the mid 1970's to complement the continuing education offerings that are still an integral part of the department. The Pulp and Paper Technology program was a victim of Ballot Measure 5 in the early 1990s and was terminated in 1992. The fully endowed Richardson Chair in Wood Science and Forest Products was added in 2000. The department changed its name in 2002 to the Department of Wood Science & Engineering. In January of this year, the JELD-WEN Corporation announced a major gift to OSU that will fund a new endowed chair in WS&E in the area of composite materials

FACILITIES

The Wood Science & Engineering department is housed in Richardson Hall which was completed in 1999. This newer building is a great resource and includes space for labs as well as offices and meeting rooms. The one

challenge that should be examined is wireless computer access for both faculty and graduate students. At this point, wireless networks are becoming less expensive to set up and notebook computers with wireless capabilities are available for around \$1,000.

ADMINISTRATION

Tom McLain became department head in 1993. Positive comments were received by the team about Tom's management style and vision on issues like hiring faculty in areas of forest products marketing and wood anatomy and quality (to bridge with other groups in the college) a number of years before others fully perceived the need.

GRADUATE TEACHING AND ADVISING

There are two master's degrees and one doctoral degree offered by the WS&E Department:

- Master of Forestry (MF) in Forest Products. This is a non-thesis terminal degree for professionals who seek advanced education in a specialized area. A paper, written in thesis format is required. The examining committee is composed of the major professor, the department representative and at least one more member from the WS&E department or another department involved in the student's program.
- Master of Science (MS) in Wood Science. Thesis degree, examining committee is composed of the major professor, minor professor, college representative and a Graduate Council representative.
- Doctor of Philosophy (PhD) in Wood Science. Dissertation required, if a dual major degree, then the dissertation must be acceptable to both departments. Examining committee is composed of the major professor, minor professor, college representative and a Graduate Council representative.

The "Graduate Studies in Wood Science" publication states that the required background for graduate studies in wood science is a Bachelor of Science degree from an accredited four year program that includes a strong background in science and mathematics. Students must include course work from other University departments as a "minor." Common minors selected include statistics, engineering, chemistry and business.

One suggestion is to provide some examples in the "Graduate Studies in Wood Science" publication of sets of courses in the minor areas that are commonly selected. Examples would allow prospective students to get a sense of the coursework that might be included from other areas.

Content areas included within WS&E department are very diverse. These areas include composites, structural aspects of wood, marketing of forest products, deterioration of wood products, and additional related topics. Students did not seem confused by the differences in the areas that they study and they appear to accept, that by its nature, WS&E is comprised of disparate components.

All professorial faculty members serve as Graduate Faculty in the role of major professors or committee members on examining committees. For the 36 students with funding support listed in Table D1, there are fourteen faculty members listed as major professors or co-major professors. Based on the information from this table, only Brown and McLain (Department Head) are not serving as a major professor or co-major professor. Counting the role of co-major professor as a "half" share, the range of graduate students supervised is from 1 to 5, with an average of 2.6 and a median of 3. Ganio has a half share, Funck, Karchesy and Milota each serve as major professor for one graduate student, Brunner and Reeb both serve as major professors for two students, Hansen serves as the solo major professor for three graduate students, while Leichti and Morrell serve as the major professor for three graduate students, one solo and four shared and two solo and two shared, respectively, Gartner, Gupta and Rosowsky serve as the major professor for three and a half students, two solo and three shared, three solo and one shared, and two solo three shared, respectively, Simonsen serves as the solo major professor for four graduate students, and Li serves as the solo major professor for five graduate students.

There is an annual review of students that provides them with written feedback on their performance and progress toward their degree. When students leave the department, an exit interview is conducted by the Department Head. The exit interview form used in this process was included in the self-study materials. This interview is used to provide feedback to the department on how they might improve the graduate program and graduate experience. While this is a good opportunity to establish a connection with a senior graduate student/soon-to-be alumnus, it should be recognized that the answers may be tainted by social desirability - the student may provide answers that he/she believes match what the Department Head wants to hear.

Success has been noted with the dual major option at both the MS and PhD level, and many WS&E graduate

students use this option. A student will complete the requirements for both degrees, and although only degree is granted by the University, both majors are noted on the student's transcript. Students have paired a wood science degree with degrees in civil engineering, statistics, mechanical engineering, forest science, economics, as well as others.

Based on the degree descriptions provided, there are few required core classes which gives students the flexibility to create a program of study that fits their needs. The department performed a significant review of the graduate curriculum two years ago and students are beginning to transition to the new core sequence. Two new courses, Wood Science I (WSE521) and Wood Science II (WSE522), came out of the redesign effort. WSE521 is being offered for the first time in the winter term of 2004, and WSE522 will be offered in the spring term of 2004 for the first time. All graduate students in WS&E are required to take these courses. An existing advanced timber engineering class (WSE560) will be expanded, a new course in wood quality (WSE5xx) and advanced wood mechanics and physics (WSE5xx) are slated to be taught in AY2005, with an advanced wood chemistry course (WSE5xx) to follow in AY2006.

At the student meeting with the Graduate Council review team, students said that they were able to get the courses they needed, and one student said when there was a time conflict between classes, the meeting time of one of the classes was changed. When students were asked about slash courses, few specific comments were made and students seemed to be "OK" with the classes. One student did suggest that it might be helpful if a separate additional meeting for the graduate students could be held once a week to reinforce or add graduate content.

In the meeting with graduate students, two students indicated that they should finish their degrees this summer. One stated that employment prospects were "bleak," and the other said that he had talked with one firm and they were interested in his research, but the prospects of a job were unclear. The surprising finding from these two students was the lack of a job search strategy and action. The review team does not know what caused this situation (e.g., student inaction, faculty-student miscommunication), but it is unsettling. As a point of comparison, at the PhD level in the business disciplines, letters of introduction and the student's resume would be mailed from members of the student's committee to professors at institutions where the student was interested in interviewing for a job. The review team understood that the job market for graduates was good, but with only a few months remaining before they were to leave the university, these student's experiences indicate the opposite.

Given that most students are funded as research assistants (RAs) and not teaching assistants (TAs), it is not surprising that students do not often teach. Faculty members also stated that it was important to the department that students saw "real" faculty members in the classroom rather than graduate students. The faculty indicated that students were well prepared to give talks, but a very small number had done much teaching beyond an entire lecture. As PhD students may move to jobs at other universities (7 of 33 graduates listed in Table D2.b were at universities), and begin their own research programs, begin to work with their own graduate students, and take on college and university service obligations - they must also begin to teach. It would be helpful for students to gain teaching experience in the environment where they already have the support from their major professor and committee. In regard to the comment that suggested an additional meeting a week for graduate students in slash courses - this is one possibility where doctoral students might gain some experience teaching.

Two professors have no assigned teaching FTE; Reeb and Rosowsky, although Rosowsky was part of the team that taught the 560 class in winter 2004. Professor Rosowsky holds the Richardson Chair in Wood Engineering and this is the reason for no teaching FTE. For those assigned FTE in teaching, the range is from a low of 0.08 (Brown) up to 0.28 (Morrell) with a mean and median of 0.15 (see Table 3). During AY2004 there were 30 courses scheduled to be taught by WS&E faculty; fifteen undergraduate classes, six "slash" courses (i.e., WSE4xx/5xx), and nine graduate classes (see Table 4). Of the nine stand-alone (i.e., not "slash") graduate classes, five are one credit seminars (WSE507/607), two are required core courses (WSE521 and WSE522), and one is a topics class (WSE611).

During the site visit, an estimate of student credit hours (SCH) per FTE was requested. The estimate provided was that approximately 700 SCH per FTE of teaching was delivered by the WS&E department, and it was stated that the university average was around 300 SCH per FTE. An approximation can be obtained by using SCH values from AY03 and FTE from AY04 listed in Table C3; the SCH/FTE based on these figures was 829 (1,617/1.95).

The majority of graduate students come from other departments on campus or other universities. In the situation where a WS&E undergraduate student wishes to pursue a graduate degree in the department, it will be difficult for them to find "new" information for their graduate program. A WS&E undergrad is required to

take WSE312 (anatomy), WSE314 (physics), WSE316 (chemistry) and WSE318 (mechanics); these are the content areas are addressed in more depth in the required graduate classes WSE521 and 522 (Wood Science I and II). At the four hundred level, students are required to take WSE440*, 441*, 442*, 445* and 460; in this set, only 460 is not offered as a slash course. This leaves only two slash courses (WSE452/552, Process Control in the Forest Products Industry, WSE455/555, Forest Products Marketing) that a graduate student can take without "retaking" a class that was required in their undergraduate program.

When faculty were asked about the "graduate experience" for graduate students in slash courses, there were a number of examples offered of the additional requirements for graduate students in slash courses. Clearly, the graduate program is important to the WS&E faculty - from their answers, it appears that are serious about making slash courses different from the undergraduate courses.

Average course evaluations for graduate WS&E courses (Figure 4) are consistently high, and for six of the last seven years they were above the mean for other College of Forestry graduate classes. Three individuals have been recognized for their teaching/advising/mentoring excellence. Barbara Gartner received the 1998 Aufderheide Award for Teaching Excellence from the COF. Jim Wilson received the 1998 Kliever Award for Excellence in Mentoring awarded by the COF honor society. And most recently, Jeff Morrell received Distinguished Professor recognition from OSU for 2003 - this is the highest recognition that OSU awards faculty. The OSU press release about this award (<http://oregonstate.edu/dept/ncs/newsarch/2003/Oct03/distprofs.htm>) primarily cited his research, but his research activities have obvious benefits to the graduate program as Jeff was one of the faculty supervising a larger than average number of graduate students (Table D1).

Because of the prominence of faculty members in their field of research, most graduate students already have a preference for a major professor when they apply to the program. In the case that a student does not have a preference, the default is to assign the chair of the Graduate Admissions Committee as the major professor. This process assures that all students have a major professor assignment when they arrive on campus. Effecting a change in major professor does not appear to be difficult, but if it occurs later in the student's tenure at OSU, it may increase the length of the student's graduate program as the student needs to become involved with different research projects (and lose "credit" for projects that they were previously involved in). The variable in this process is the formation of the student's graduate advisory committee. Forming this committee late in the student's program will not necessarily slow the student's program, but that is a possibility (e.g., the minor professor may not agree that the minor classes are the best fit for the student's thesis project and the student must take additional coursework).

Responses to the survey distributed by the Graduate School to current students indicated that students were generally satisfied (see Table D4). Twenty-seven Likert-type items covered topics that ranged from research facilities and equipment to advising and graduate program examinations. All statements to which students responded were phrased in the affirmative and responses were collected on a five point scale where 1 = Strongly Disagree and 5 = Strongly Agree. Responses that fell below a mean of 4.00 are listed in the following table.

Lower rating on an advising question and a negative comment about "introduction to procedures" are found in the survey of current graduate students (see Table D4). Because of faculty concerns with new student orientation, this was addressed by the department in the Fall of 2003. The first meeting of one of the graduate seminars was devoted to "orientation" topics. Students that were new to the program felt that this was very helpful to knowing where to find necessary resources.

Table 1 - Selected results from Table D4

Mean	Item #	Topic
3.86	4	office space is adequate to needs
3.91	5	library resources are adequate
3.87	6	adequate selection of graduate courses
3.78	12	initial advising was an adequate orientation
3.92	19	the mechanism for changing major professors is suitable
3.86	22	stipends are adequate

3.67	23	the department offers adequate opportunity to gain teaching experience
3.63	27	there is a well-established mechanism for graduate student participation in departmental decisions affecting students

Responses to the exit survey conducted by the Graduate School for students who graduated between 2000 and 2003 were generally positive (see Table D5). Graduates were asked to rate their satisfaction on a five point scale where 1 = Very Dissatisfied and 5 = Very Satisfied. The mean scores for departmental advising, graduate instruction and graduate committees were between 3.55 and 3.91, while the means for major professor, financial support and research resources were between 4.09 and 4.64. In assessing the major professor, there were a high number of responses in the "Agree" category for the different tasks (Agree was the most positive ranking available). To get average scores for these items, a score of one was assigned to Disagree and five to Agree. There were two items that fell below a mean of 4.00 (see Table 2 below). Because of the skewed nature of the responses, it was helpful to identify items where the median was 4.0 or less. Items with a median below 4 included item 5.d., 5.h., 5.j., and 5.k. Rating the time spent by the major professor (assigning a 5 for Very Satisfied, and 1 for Not at all Satisfied), the means ranged from 3.85 to 4.31. The mean for two of these items fell below 4.0; item 6.a. (dissertation selection), and item 6.c. (proposal writing).

Table 2 - Selected results from Table D5

Major Professor Ratings			+ 5 = Agree, 1 = Disagree
Med = 4.0	Mean+	Item	Topic
Yes	3.9	5.d.	was knowledgeable about formal degree requirements
Yes	4.3	5.h.	helped in my search for professional employment
Yes	3.4	5.j.	explained graduate school survival strategies to me
Yes	4.2	5.k.	maintained good relations with other committee members
Major Professor Time Rating			* 5 = Very satisfied, 1 = Not at all satisfied
	Mean*	Item	Topic
	3.9	6.a.	dissertation selection
	3.8	6.c.	proposal writing

The questions that provided some surprising results were the graduates' responses when asked if they would start over with the same major, degree, etc. Only six of thirteen stated that they would start over with the "same major," and only seven of thirteen said they would start over at the "same university."

From a survey done by WS&E of all graduate alumni for which addresses were available (see Table D6), there are a few notable findings. The primary reason for pursuing a graduate degree was to gain expertise in the content area (mean 1.375; 1 = most important, 2 = next in importance, etc.), followed by getting research skills (mean 1.83), gaining the prestige of an advanced degree, to change my field, and having flexibility in job options were tied with a mean of 2.0. In rating aspects of the graduate school experience (five point scale, 1 = Unsatisfied, 5 = Satisfied), the diversity and availability of graduate courses and professional relationship with the graduate committee fell below a mean of 4.0, while the average overall satisfaction was 4.33. Based on the responses to outcomes of the graduate degree, graduates responded that appropriate skills were achieved in most areas. Respondents rated oral presentation/competency, knowledge of computer applications, professional writing skills and readiness for professional leadership as the outcomes that were most important for their job or career. Rating whether these outcomes were accomplished, only readiness for professional leadership was rated above 2.0 (low numbers are desirable on this scale) while the others had a mean of 2.0 or below (1 = A great deal, 5 = Not at all).

Issues of concern to the review team that are also identified in these surveys include; an adequate selection of graduate classes (especially for WS&E undergraduates that enter the program), the opportunity to gain teaching experience, and the potential for some faculty to work with a large number of graduate students and possibly have trouble giving adequate time to each graduate student.

The response rate for the current graduate student survey (see Table D4) and the survey of recent graduates (see Table D5) were acceptable at nearly 70 percent and less than 45 percent, respectively. Unfortunately, the response rate for the survey of alumni is under ten percent (see Table D6). More troubling than the low response rate on this one survey, it appears that no checks for representativeness appear to have been performed on any of the surveys. For example, in the alumni survey, the ratio of MS students to PhD students is 2:1 which appears to be similar to the current ratio of MS and PhD students in the program, but we do not know what the ratio is in the population. This deficiency severely limits the extent to which the responses can be generalized to these populations. That is, we know how the respondents feel, but we have no confidence in stating that the rest of the population feels the same way.

FACULTY AND RESEARCH PROGRAMS

Faculty and Staff Resources

The Wood Science and Engineering Department currently has about 37 professional staff. There are 15 on-campus professorial faculty, with FTE distributions of 2.4 FTE teaching, 8.4 FTE research, and 3.7 other. Rounding out the faculty are two extension agents, two adjunct and four courtesy faculty, and a total of nine research associates or assistants. Additionally, four administrative support staff are employed.

The Department has recently experienced a loss of 2.75 faculty FTE - which may increase by another 1.0 FTE this academic year - due to retirements and other causes. This has created two issues - a need for redistribution of the teaching load, and a loss in some research expertise. The teaching load was reallocated among faculty and by hiring a research associate to teach an undergraduate class. The impact on the department's research portfolio is significant in that the focus of expertise is in an area (composites) of expected research growth, and the Department recognizes that it must remain competitive through development of forward-looking research. Currently, to fill the needs, a search is underway for a new junior faculty member in composite materials science, with an expected start date of fall 2004. Two other positions are also under consideration. The Department has proposed to the College of Forestry that a marketing and business management faculty member be added; that proposal is under consideration. Further, the recent receipt of a gift from the JELD-WEN Corporation will fully endow an additional chaired position, which is expected to be filled with another wood-based composites faculty member.

Faculty Diversity

The current faculty represent broad range of academic interests and institutions from which they received their degrees. During the visit, it was noted that Wood Science and Engineering is a broad field that must encompass many disciplines to be responsive to industry and societal need. Industry demands that the Department maintain both a science and a business perspective. The current makeup of the faculty and the direction of new searches are in line with this well-rounded approach.

In terms of gender and ethnicity, it appears that there is broad ethnic diversity; however, there is only a 7% representation of women in the professorial faculty (the percentage is even lower if one considers the other professional positions). This low percentage is not reflective of overall University goals, nor of the percentage of female graduate students, which - in AY2003 - was 37%. It appears that there may be an opportunity to create a more representative gender balance through encouraging female participation in the process of filling the proposed faculty positions.

Research Programs

The Wood Science and Engineering research programs are reportedly undergoing a change in focus. The regional lumber industry is becoming less competitive, and therefore there can be less reliance on regional sources of industry research funding; consequently, there must be more reliance on national and international Industry funding and government funding. The Department has invested strategically in very modern and well-equipped research facilities, with the exception of wood composites. These facilities are well-used by faculty and graduate students, the majority of whom are supported through research grants. A review of the research grant award history of the individual faculty members indicates, across virtually the entire faculty, a steady history of research grant awards in the last five years. This appears to be an indication of the value of the faculty's broad research foci and the excellent research facilities. Continued diversity across grant donors and of awards across faculty will help ensure a steady flow of funds and an increase in the reputation of the Department's research capability.

Funds received by faculty for grants, contracts and fees are increasing, and are approximately \$1.4 million for calendar year 2003. Faculty output averages approximately two peer-reviewed papers per year, although the

output varies widely by faculty member. Significantly, the average number of research presentations per faculty member has increased from something over three in 1999 per person to more than eight in 2003. This indicates an increasing interaction with industry and other academics.

The Department asked the review panel for recommendations of areas for future research. This question will best be answered by the industry directly, and increased interaction with key constituents - through presentations or publications - to facilitate such answers. It is recommended that a continued focus be placed on encouraging faculty publication and providing resources to allow for exposure of Wood Science and Engineering's expertise through presentation-especially to audiences that will provide connection to future research funding.

GRADUATE STUDENTS

The graduate mission of the department of Wood Science and Engineering is to offer a challenging curriculum that serves as the foundation for an active research program. The department offers MF, MS and Ph.D. degrees.

In the self-study report there was ample evidence of effort being expended by a dynamic faculty to revise the curriculum, and to provide a core program that meets the needs of a diverse graduate student body being recruited from extremely diverse academic and cultural backgrounds. There is evidence in the document of new classes in the process of development that will build upon the strengths of the department's faculty. In addition, there was evidence of the faculty having given thought to their role in the OSU 2007 strategic plan with a proposal for a new innovative program to exploit the connections between new wood products and the business world, and for a second program that will address durability of wood products with special emphasis on linking wood product structural research and biodeterioration - two of WS&E's strongest research programs.

In the context of evaluating the graduate student body, the self-study report provided a wealth of information that provided a clear picture of the department's efforts in the graduate area. The faculty and department head are to be commended for their efforts.

The WS&E department has maintained a remarkably stable graduate student population that has ranged between 20 and 34 students over the past 10 years. Currently, there are 34-35 students enrolled in the various graduate degree programs. Approximately 70% are men, 30% are women, and 49% are international students. Over the past 10 years WS&E has graduated on average about 8-9 students a year, which is a remarkable achievement for the number of faculty in the department. The graduate degrees were split about 2:1 Master's to Ph.D. Interestingly, during the past 5 years an increasing number of students have graduated with joint degrees (21 between 1998 and 2003 vs. 6 between 1993 and 1997). About one half of joint degrees favored the combination of Civil Engineering and WS&E. Given the latter fact, it was somewhat surprising not to see more clear documentation of the structured relationship between the graduate programs that obviously exists between the College of Engineering and WS&E, nor any evidence of future developments between COE and COF.

The department's records on postgraduate employment are exemplary. We were definitely impressed with the high percentage of graduates that have been successfully tracked over a 10 year period. A high percentage of WS&E graduates gain employment in their field. Careers seem to range widely from academic positions such as professor, post-doctorates, and research assistants, to the wood products industry where graduates are employed as engineers, technologists, and consultants. Over a 10 years period 21 students prematurely left the WS&E program while about 100 students graduated. The review committee suggests that resources (and rewards) be committed to graduate student recruiting.

The graduate council committee met with members of the current graduate students over lunch. There was a good mix of students present including minorities, females, and males. The students seemed to be generally pleased with their program in WS&E. They were a talkative group, and seemed to appreciate each other's perspective. We did not sense an "unraveling" of the group that can occur when individuals vent. We got the impression that the students were happy with their program. The students seemed to be content with their advisors. Students were happy with the opportunities to publish their research findings, and to attend meetings in their discipline. There were some concerns that the core program might be a bit redundant for those graduates who enter the department with a strong background in wood science. Despite this general good feeling about WS&E, the team saw a few trends in the exit survey conducted by the graduate school that the department ought to keep an eye on. In Table D5, the answers to question 11 of the graduate school exit summary indicates that a high percentage of the graduates of 2000-2003 had second thoughts about WS&E as a major, their choice of major professor, and OSU as their university of choice. The department

should keep an eye on the outcome of this survey over the next few years to see if their recent efforts in curriculum modification result in a sway in the voting on this particular question.

One of the challenges facing departments with a broad agenda like WS&E is that of maintaining sufficient active and productive faculty in the different areas to keep a well-balanced graduate program. Table D1 indicates that virtually all faculty members are involved in mentoring between 2-5 graduate students. There is evidence of two professors serving as co-advisors of many students which we believe is a good way for graduate students to get a broader inter-disciplinary perspective of a broad subject such as WS&E.

Recruitment: The department is maintaining a consistent record of attracting and graduating its students. Even though a rather large percentage of the student body is composed of international students, the faculty seems to be happy with their ability to attract high quality students both domestic and international. In fact, there is evidence that WS&E has developed a good system of recruiting graduate students from the Peoples Republic of China and has had good success with them. Perhaps other colleges and departments might obtain useful tips from WS&E. The students who were in attendance at the luncheon did not voice any serious discontent with the department's advising/mentoring system. A high percentage of the students are involved in joint degrees and were pleased with their progress. It was not clear from the self-study report, however, at what stage in the development of their graduate programs that students decide on a dual major, and if there is a cross-college advising mechanism in place to assist them with making that decision. This feature might make a good recruiting tool if its visibility was enhanced.

Given the great diversity of research topics being dealt with in this department, combined with the large percentage of students pursuing joint degrees, it was somewhat surprising that there was no mention of the Ph.D. preliminary examination process in the self study report. In the handbook on graduate studies there is a complete description of preliminary examination requirements. We expected there to be more details of the mechanisms and requirements of advancing students to candidacy when they are co-majoring in WS&E and another subject.

Given that many students of WS&E have entered academics, it seems that there is need for some formal training in teaching. The team noted that the number of undergraduates has increased over the past two years, and this might provide opportunities for graduate students to obtain formal teaching experience in the RI program in the future especially if elevated undergraduate enrollment can be maintained.

In summary, the WS&E graduate students are moving in the right direction. There seems to be a good psyche among the students, and the faculty is not complacent about their student body and is modifying the program to meet new challenges and demands of the 21st century.

Graduate Council

June 3, 2004 Minutes

Present: Ciuffetti (Chair), Bond, Collins, Fisk, Francis, Koenig, Pedersen, Pehrsson, Rettig, Schaubert, Selker, Steel, Strickroth, Tadepalli, Waldschmidt

Absent: Bermudez

Guests: Ron Adams, Terri Fiez, Douglas Keszler, Ken Williamson

1. Approval of Council Minutes

The minutes from the Graduate Council meetings on May 20, 2004 were approved as corrected.

2. Minimum Credits for a PhD in Chemistry

Before 1992, the Graduate Catalog stated that ♦there was no rigid credit requirement; however, the equivalent of at least three years of full-time graduate work beyond the bachelor's degree is required. ♦ In 1992, a requirement was added that ♦The equivalent of one full-time academic year should of regular non-blanket course work must be included on a doctoral program. ♦ In 1994, that requirement was modified to ♦The equivalent of one full-time academic year (at least 36 credits) Douglas Keszler (Chemistry) explained that prior to 1994, 27 credits of course work were required for a doctoral degree. With the increase in credits required, enrollment in the Chemistry PhD program declined. Oregon State has the highest number of required course credits among a set of peer institutions (see Appendix 1). The University of Washington requires only one-half the number of credits for the same degree. Good students do not want to take the additional course work, preferring to focus instead on research. Before the change to the 36-hour minimum, the Chemistry Department had no trouble attracting good students. The timeline to matriculation has increased from 4 years to a minimum of 5, and 6 years is becoming common. The increase in required credits, coupled with the lowest stipends and highest demands on teaching assistants, creates many problems. To keep in line with its peers, a return to the 27-credit minimum for doctoral programs in Chemistry is formally requested.

In response to a question from Lynda Ciuffetti (Science), Keszler confirmed that most graduate courses in Chemistry are offered for 3 credits.

Barbara Bond (Forestry) noted that there is a growing trend to document competency in subject matter for degrees. What does the Chemistry Department have in place to insure that students meet a minimum standard of competency across the range of courses? Keszler said that they use a comprehensive written examination. However, the focus of graduate education in chemistry is on research. Much weight in determining whether a student is competent to carry out independent research is placed on good performance in the preliminary oral examination. Doctoral studies in chemistry emphasize research; this contrasts with undergraduate education where the breadth of knowledge is emphasized.

John Selker (Agricultural Sciences) asked whether the mastery of knowledge at the undergraduate level was sufficient to teach a course at a future date. Why do graduate programs provide a higher level of education in all subjects to enable future faculty members to teach the full range of topics? Keszler noted that the Chemistry Department at Oregon State University, and our peers, provided a broad curriculum of study. Now, the pattern is to specialize in a particular sub-discipline. Part of the pressure to specialize at OSU is that the current faculty is only 40% of its size in the recent past and the range of courses has decreased by 50%.

Bond asked for a justification for the change, arguing that the fact that other universities require 27 credits (plus or minus a few credits) is not a sufficient reason. Keszler agreed. He said that the undergraduate educational experience, which is a prerequisite for graduate work in chemistry, provides a broad base of exposure to chemistry. The PhD provides the necessary research experience for a doctorate in chemistry.

Elaine Pedersen (Health and Human Sciences) noted that the change from 27 to 36 credits was imposed on the department and was not a voluntary decision.

Selker asked what the logical basis was for any specific number of credits. He argued that the key should be whether the student had achieved the recommended training to provide basic competency. If the competency is fulfilled in the undergraduate educational experience, he would be comfortable with a minimal amount of graduate courses. Bond agreed, but argued that the graduates must be qualified to teach a variety of courses; their education should not consist solely of writing a dissertation.

Ciuffetti asked about the content of the written examination. Keszler explained that the graduate program in chemistry is divided into several sub-disciplines (e.g., analytical chemistry and physical chemistry). Each sub-discipline identifies which courses are required, provides mentoring guidance throughout the educational program, creates and grades written examinations in the respective sub-discipline.

Martin Fisk (Oceanic and Atmospheric Sciences) asked for more information on about full-time student status for one academic year. Bruce Rettig (Graduate School) explained that graduate assistants register for 12 to 16 credits, but that full-time status is defined as 9 to 16 credits. In response to Fisk's question whether the current 36 credit requirement refers to non-blanket credits, Rettig said that it does.

Brent Steel (Liberal Arts) said that, during the most recent program review of Chemistry, graduate students said that they needed more time for laboratory research.

Bond said that she is not concerned about the reduction in in-class minimum hours, per se, but believed that a clearer explanation about the requirements was needed. Sally Francis (Graduate School) agreed that the Council needs time to explore the broader philosophical issues associated with university minimum standards for doctoral programs. Dale Pehrsson (Education) said that any other departments of programs that wish to seek similar exceptions need to present their requests more effectively than Chemistry did. The Council agreed to discuss this issue next year.

The request that the minimum number of regular non-blanket course work for a PhD in Chemistry at OSU be 27 credits rather than 36 was approved.

3. Computer Science Graduate Program Review

On March 1, 2004, the Graduate Council conducted a review of graduate programs in computer science. Barbara Bond, chair of the review committee presented the review report to the Council. She began with the summary and findings, which follow.

The Graduate Council last reviewed the graduate program in Computer Science in 1992. The recommendations that came from that review can be summarized as follows:

1. Review comprehensive exam procedures.
2. Develop channels of communication with graduate students.
3. Reduce the graduate student to faculty ratio.
4. Create sections of 500-level core courses that are separate from 400-level instruction.
5. Assess graduate student recruiting and admission, and monitor parameters for ongoing evaluation of quality of graduate students.
6. Centralize and improve facilities.

Progress has been made over the past 12 years in meeting some of these recommendations. In other areas further attention is still needed.

1. The comprehensive exam for M.S. students has been eliminated. Although the current procedures appear adequate, some of the students do not understand the rationale for eliminating the comprehensive exam.
2. Graduate students are satisfied with the quality of instruction and advising but they report

feeling disconnected with departmental operations. There is still a need to improve communication and involvement.

3. The graduate student-faculty ratio in 1992 was 107/13 compared with 112/15 today; however, this includes professors Cull, Sethia, and D'Ambrosio, who have retired or will depart soon.
4. Four core courses are taught as 400/500 ~~slash~~ courses. Students do not perceive that these courses offer ~~true~~ graduate-level learning.
5. The recruitment process is largely passive and could be improved. The admission process appears to be working, although there are issues with timely notification. Improvements are needed to monitor or improve quality of graduate students accepted to the program.
6. The new Kelly Engineering building, under construction, should meet the facilities needs. The 2004 review committee offers the following recommendations:
 1. Be proactive in recruitment to increase interest and applications of students from top undergraduate institutions and of women and minorities. Develop and implement a strategy to recruit these students.
 1. Advertise OSU ~~s~~ CS program at key undergraduate institutions.
 2. Develop a ~~feeder network~~ between key undergraduate institutions and CS ~~either~~ among individual faculty (perhaps based on their network of colleagues) or administratively.
 3. Advertise specific graduate assistantships available through grants ~~this~~ can be done both formally (professional web sites, journals, postings at national meetings) and informally (sending an advertisement as an email attachment to a list of colleagues).
 4. Faculty members in the CS department have a large number of NSF grants. Use NSF Research Experience for undergraduates (REUs) as a means to bring promising undergraduate students from outside OSU onto campus during the summers to do research directly in the labs. This could help broaden the applicant base.
 2. Improve policies for funding of graduate students.
 1. Develop a consistent policy concerning continuation of TA appointments for continuing students (i.e., contingent on teaching and academic performance, term limitations, etc). Make sure that students understand this policy before they start their graduate programs.
 2. Limit the size of the incoming graduate student population to only those that the department can fund, or only offer secure funding to one group of select students, while telling others that their chances for being funded are small or nil.
 3. Give timely notice to students concerning funding so that they can plan their own finances. It is also essential to give students an honest assessment of the likelihood for continued TA support.
 3. Enhance the amount of scholarship and GRA funding for graduate students.
 1. Develop a strategy to create scholarships and fellowships for graduate students. Many departments use relatively small scholarships (e.g. \$1000-3000/year) as a recruitment tool. Given the significant corporate support for CS, it is reasonable to try to develop endowments and gifts that provide fellowships and scholarships.
 2. Encourage the inclusion of graduate students on budgets for grant proposals.
 3. Work with the very best Ph.D. candidates to submit applications for NSF Graduate Research Fellowships. (Program officers from NSF report that proposals for dissertation improvement proposals are currently being funded at a high rate).
 4. Increase the subject areas and frequency of course offerings for graduate students.
 1. To meet the curricula needs of the graduate students, the faculty strength should be increased to a minimum of 20 FTE.
 2. If the faculty cannot be increased to this size, look into alternative ways of offering courses, such as tapping into televised courses from the National Technological University or other universities (Chico, Stanford, Oregon Graduate Institute, for example). Other possibilities might include seeing if the University of Oregon or Portland State might be willing to allow a few students from OSU to attend classes in selected areas.
 3. Look seriously at the expectations and learning opportunities for graduate students in all ~~slash~~ courses and revise, as necessary, to make sure they offer true graduate-level learning.
 5. Improve communications between administration/faculty and graduate students and increase graduate student participation in research and business activities in the

department.

1. Increase opportunities for students to present their work and to interact with faculty during the ♦Research Fest♦ (perhaps more focused sessions, get faculty to commit to presenting their posters, have faculty or students give short presentations with time for questions).
2. Increase student input on departmental decisions such as hiring new faculty and departmental governance.
3. The orientation for new students should be critically evaluated, improved and possibly extended.
4. Establish a committee of three to five students to serve one-year terms as Graduate Student Representatives (♦Grad Reps♦; voluntary, appointed or elected). Invite these students to attend faculty meetings. Involve Grad Reps to serve on departmental committees (e.g., planning committees for seminars and the fall orientation, selection committees for new faculty, departmental governance) with the expectation that they are to be a conduit of information between the faculty/administration and the graduate student body.
5. Ask a committee of CS and ECE graduate students (perhaps ♦Grad Reps♦) to develop their own plan for improving ties between these student groups.
6. Increase the number of Ph.D.s in the program. Aim for eight Ph.D.s per year to finish the program.
7. Develop and maintain a mechanism to track graduate student performance after graduation.
8. To be competitive, OSU needs to find a way to create a more competitive salary structure for CS faculty.

Bond said that the review team was impressed by the quality of faculty in such a small department. The primary weakness, as seen by the team, was the composition of the graduate student body and the lack of faculty. At this point, 75% to 80% of the graduate students are international, mostly from China and India. Very few domestic graduate students are enrolled; most of them come from the local area. The review teams concluded that a more aggressive recruitment strategy was needed for domestic students. Although the percentage of women students is relatively low, this is also true for our peer institutions. Currently, there are no American Indians or black American students. This is not dissimilar from our peers, but does provide a recruitment opportunity.

Terri Fiez (Director of the School of Electrical Engineering and Computer Science♦EECS) said that most of the points made by Bond are true. EECS set ambitious goals but believes that they are attainable. The student to faculty ratio, although high, is similar to that found across Oregon State University. The external reviewer did point out EECS has an exceptional faculty. Loss of these faculty members to other universities is a constant fear. EECS has developed research-cluster hiring; three new faculty members are being hired this season. The cluster research and education model is creating a unique teaching environment.

Fiez acknowledged that some students believe they are not fully informed about department developments, but noted that students are represented in key departmental decisions including faculty hiring. EECS is working to broaden student involvement.

The Research Fest not only attracted new students but also actively engaged current graduate students. This was a good experience that allowed students to learn what other students were doing and what opportunities are available for future work.

Recruitment strategies have changed to match the evolution of research clusters. The number of PhD students doubled by turning over the responsibility to the individual clusters, which are responsible for providing funding and for recruiting their graduate students.

Although EECS offered a new graduate student orientation Fall 2003, it will seek to improve this process. Teaching assistants received a one-day workshop on how to teach.

The composition of the graduate student body is a concern to EECS. Nationally, 75% of the graduate students in computer science come from China and the Indian subcontinent. This year, there has been a large reduction in Chinese students because of problems with visas. EECS will be more proactive in diversifying its graduate student body.

Fiez did not have a specific percentage for the numbers of students who change from PhD to master♦s

degree programs. Although EECS has not kept track of where students go, they are working on it now. The difficulty in tracking students has been the manpower needed to do this. With the advent of on-line systems, Fiez hopes to improve on this issue.

Fisk offered two observations. First, the goal of the College of Engineering, including computer science, to be one of the top 25 programs in the country would require huge advances. Second, the external reviewer noted that computer science faculty graduate only one PhD student per person every other year. To achieve the stated goals in PhD student completion will require major changes.

Dean Adams (College of Engineering) expressed his appreciation for all the work the review team did. From his perspective, comparing the current computer science research and graduate education program now relative to what it was 5 years ago equates to an explosion. The EECS will continue to experience major growing pains and will continue to operate with a high student/faculty ratio for some time.

Bond observed that, while OSU is trying very hard to have a top-25 engineering program, so is everyone else. Current work will just keep us in the running, stated an external reviewer. To achieve more, more resources and effort will be required.

Selker, noting the national decline in foreign applicants, said he was concerned that the top ten schools will attract the good students, leaving the less qualified for OSU. In one year, there has been a 40% decline in foreign applicants. Fiez said that the decline is closer to 60%, but that this needed to change at OSU because of the overly large number of applications. She believed that EECS lost the bottom candidates. What is happening is an increase in the recruitment of domestic students, which is not a bad thing. EECS may increase the quality of its student body.

The Council approved the report of the Computer Science graduate program review.

4. Civil Engineering Graduate Program Review

On February 10, 2004, the Graduate Council conducted a review of graduate programs in Civil, Construction, and Environmental Engineering. Dale Pehrsson, chair of the review committee presented the review report to the Council. The summary from the report follows:

Summary of Graduate Review Recommendations:

The CCEE Department is well placed to move forward in its program improvement mission and vision. CCEE has a clear understanding of its strengths and weaknesses.

The CCEE Department, administrators and faculty members will need to evaluate the staff and resource power needed to meet the demands of attaining the status of a Top 25 College of Engineering. The Department members articulate a desire to attract the best and the brightest in terms of graduate studies. The Department Chair and Dean wish to improve the quantity/and quality of women and underrepresented groups of students. Grant and funding processes have been very successful but will need more focus to become a top 25 Department/program.

CCEE needs a well-defined recruitment and retention plan to market programs and attract students and needs realistic financial and administrative processes in place to support the students through the process of graduation and employment. The Department needs to implement a well-developed recruitment and retention plan for underrepresented students, students of color and women. The Department has some good systems in place and clear website information. However communications systems for students need further enhancement and organization to optimize student performance.

The CCEE Department needs to decide on its clear mission and find its professional niche. The offering of many programs with specialties can diffuse faculty energies and students resources. It is recommended that CCEE administrators and other faculty members decide on a clear vision that will catapult them to the Top 25 Program status they desire.

Research priorities and faculty load formulas need to be reviewed with graduate teaching and research commitments being considered more closely. Curriculum needs refinement; programs and classes no longer being offered need to be removed from catalog information.

During the Department review, it was apparent that faculty members understood their strengths

and needs. They were forthcoming in the review, were clear about concerns and displayed a strong desire to move forward and improve. They portray a strong collegial work group with a definite esprit d \heartsuit cor that should be preserved.

Growth necessary to achieve Top 25 Status will require retention and professional development of existing faculty members, and the successful recruitment for additional key positions. The current size of the department relative to Top 25 Programs demands that existing faculty fill a wide range of academic and administrative roles. The development of a comprehensive financial plan to provide for faculty development and growth, department expansion, and reduce the wide range of competing demands on faculty will benefit the people and programs.

We recommend that the CCEE department and faculty members revisit their strategic plan and consider innovative ways for generating additional earnings (e.g., distance learning, fundraising, professional development and short course offerings and workshops) thus, realigning it with the University's newly adopted strategic plan.

Further, we encourage the faculty members and administrative personnel to strategically plan and prioritize for the resource demands that will develop as they strive towards program improvement and top 25 status. The department is in the process of restructuring, we recommend communicating the reorganization plan and discussing the impact on faculty and programs.

The findings of the Civil, Construction and Environmental Engineering (CCEE) Graduate Review Panel suggest that this program does have major strengths and that administrators and faculty members also recognize their needs. It is apparent that they are working cooperatively to meet the challenges they have set for themselves. Based on our findings our overall recommendation is that this program merits continuing support in meeting its goals, challenges and aspirations.

Ken Williamson (Head of the Department of Civil, Construction, and Environmental Engineering) said that the key issue is the department's plan to move to a different level. CCEE will expand the number of graduate students and increase the quality of the graduate experience. It needs to develop a centralized approach to accomplish this. CCEE needs centralized graduate advisors. In the past, faculty members have been responsible for performing this role. The department is currently working towards this change.

Faculty numbers in CCEE are in transition, due mainly to retirements associated with changes in the Public Employees Retirement System. The department is successfully hiring new, quality faculty. The new hires are increasing the diversity of the faculty. Of the five new hires, two are women. One of the women is Asian and one of the male hires is also Asian.

In response to a comment from Pehrsson about department reorganization, Williamson said that there is a plan to transfer the Environmental Engineering program to the Department of Chemical Engineering. He recognizes that changes of this magnitude make faculty nervous and appreciates their concern about the change.

Pehrsson shared the comments of the external review members who noted that, from a national perspective, this program is well suited to Oregon's needs. Williamson added that the department is quite large \heartsuit larger than four of the academic colleges at Oregon State University. Next year, the department expects to enroll over 700 undergrad students and 100 graduate students.

Dean Adams observed that the changes in this department have been huge. It is the most productive unit on campus. The research program, which has nearly doubled over the past five years, is prestigious. The faculty is a great group of people and is showing great spirit despite huge workloads. Faculty candidates always comment on the camaraderie of faculty.

Selker noted that most clusters of research described in the self-study indicate a need to hire one or more faculty members. He asked what plans exist for structural changes to the research clusters or other plans for resource allocation to deal with this resource issue. Is the department sustainable as currently constituted? Williamson said that, as part of the initiative to achieve top- 25 status, the Department did get its share of the faculty position increases that were available. Faculty are being replaced as they retire. The department would like to grow to a level of 30 \heartsuit 35 faculty members. Top-level institutions in the nation have no fewer than 35 faculty. CCEE enrollment numbers would support this increase.

Pehrsson noted that Selker, Fisk and Francis have suggested edits for the report. She will include these edits and send the revised report to Ciuffetti for final approval, if the Council is agreeable to that process. The report of the program review in Civil, Construction, and Environmental Engineering was approved, subject to the additional editing.

Appendix 1
Memorandum from Douglas Keszler

25 May 2004

To: Graduate Council

From: Department of Chemistry, Douglas A. Keszler, Professor and Chair

Subject: Special Exemption from 36-credit rule

The Department of Chemistry is formally requesting an exemption from the rule that requires a minimum of one full-time academic year (at least 36 graduate credits) on a doctoral program. Prior to the adoption of this 36-credit rule in the 1990s, the Chemistry Department had an agreement with the Graduate School for 27 graduate credits on a doctoral program. The Chemistry Department agrees with the principle of one full-time academic year of course credit for a doctoral program, but this translates into three courses per term and 27 credits rather than 36 credits. The 27-credit guideline is more consistent with peer chemistry graduate programs. Adoption would allow us to be more competitive in attracting the best graduate students, and it will allow greater cooperation between the chemistry departments at OSU and UO.

Comparison to Peer Institutions

Minimum Number of Courses Required for Ph.D.

Semester Calendar	
Pennsylvania State University	5
University of Illinois	6
Purdue University	6

Quarter Calendar	
University of Oregon	6
University of Washington	6
University of California Davis	7
Ohio State University	11
Oregon State University	12

As noted from the tables above, among peer chemistry graduate programs OSU has the highest course demands on students. The OSU requirement is inconsistent with the very strong emphasis on research that is common for chemistry graduate programs. It is generally considered that an undergraduate chemistry degree adequately prepares students for an advanced degree, so that an extensive series of courses is not required. The imposition of this 36-credit rule has had rather profound effects on the Department's graduate program. While most chemistry programs around the country have flourished and grown during the past decade, the enrollment in our Ph.D. program has decreased considerably. Prior to the imposition of the 36-hour rule, we had more than 75 Ph.D. students; we are now below 55 students. Certainly, the 36-hour rule is not the only contributor to the enrollment decline (past fiscal problems in the College of Science also contributed), but it is true that good chemistry students having interests in graduate school want to maximize involvement in research; they do not want to spend too much time in formal course work. Since the imposition of the 36-credit rule, we have also observed a general shift in student-body composition, drifting away from students with intense interests and productivity in research to consumers of formal classroom instruction. One effect of this shift has been an increase in the time to degree. Prior to imposition of the 36-hour rule, several faculty in the Department were regularly able to graduate students within four years of matriculation. This timeline

has now been completely replaced with a minimum time to degree of 5 years, and 6 years is becoming more common. The 36-hour rule may be perceived as a way for some departments on campus to strengthen their programs, but it has not worked so well for the Chemistry Department.

We regularly compete with schools in the UC system and the University of Washington for top graduate students. All of these institutions have course requirements that are considerably lower than our own. They are viewed much more favorably by top prospective students as research-intensive universities. We cannot expect to be consistently competitive in attracting these top students - we have the highest course requirements, the lowest stipends, and the highest time demands on teaching assistants. In selected subfields of research, e.g., those programs involved in ONAMI, we are beginning to collaborate much more effectively with the University of Oregon in recruiting graduate students, sharing resources, and generating new programs. Closing the gap in our course requirements (see table on previous page) would assist considerably in these efforts. We need to wake up and renormalize our graduate program; a relaxation of the 36-hour rule is a good place to start.

Graduate Council

May 20, 2004 Minutes

Present: Ciuffetti (Chair), Bond, Collins, Francis, Koenig, Pedersen, Pehrsson, Rettig, Schaubert, Selker, Steel, Strickroth, Tadepalli, Waldschmidt

Absent: Bermudez, Fisk

Guests: Vicki Ebbeck

1. Approval of Council Minutes

The minutes from the Graduate Council meetings on May 6, 2004, and April 15, 2004 were approved.

2. Summer Decisions

The Category II Committee will continue its work over the summer. If grievances arise during the summer, Sally Francis (Graduate School) will contact Council members. The minutes for June 3 will be distributed and approved by email, but they will not be posted to the web site until enough time has elapsed to allow Council members an opportunity to examine the minutes.

3. Approval process for non-credit certificate programs

The Curriculum Council asked the Graduate Council to review their proposal for the review of non-credit certificates and note any concerns. Although these certificates are not transcript visible, Graduate Council members have some concerns that the public might confuse non-credit certificates with graduate certificates. After learning that non-credit certificates have a history that precedes the creation of graduate certificate programs, the Council concluded that it would not pursue this issue at this time. But, it is prepared to consider the issue if problems are brought to its attention in the future. The process was approved as submitted.

4. Graduate Level Learning

On May 13, 2004, the Faculty Senate discussed recent actions by the Graduate Council and the Curriculum Council. Background materials for that session are available at <http://oregonstate.edu/dept/senate/agen/2004/200405a2.htm>. The Faculty Senate plans to vote on a motion to approve the requirement that at least 50% of all credits on a graduate program of study consist of graduate standalone courses at its June 10, 2004, meeting. The Graduate Council reviewed some of the points raised at the Faculty Senate and discussed what type of written material should be given to the Faculty Senate Executive Committee for use at that June meeting.

Faculty from the College of Liberal Arts (CLA) raised several concerns at the Faculty Senate meeting. Although the CLA leadership is sympathetic with the 50% rule, they are concerned. With limited budgets and heavy undergraduate class enrollment, some departments will find it quite difficult to offer many structured graduate standalone courses. Consequently, some programs might find it necessary to offer as many as 9 credits of blanket-numbered courses. Blanket numbered courses, such as individually guided research and reading and conference, if done well, take much time. Some CLA department chairs worry that too many blanket numbered courses might be provided with insufficient guidance to provide the necessary quality needed. An argument has been offered that this could result in a decline in the quality of graduate education rather than an improvement.

Budget cuts and a surge in recent retirements have reduced the size of the faculty in many departments on campus. CLA is experiencing loss of faculty at the same time that undergraduate enrollments have risen sharply. One argument offered is that the 50% rule is an unfunded mandate♦♦♦

requirement that more work is expected without providing additional funds. One suggestion made at the Faculty Senate meeting was for an opportunity for some departments to make an orderly transition to the 50% rule rather than make the change Fall 2005. Some departments will need a few years to make the transition; others will not. If some programs are granted an exception, those programs worry that they will carry a stigma. To avoid the stigma, faculty are already teaching on an overload basis. This is likely to increase during the next few years until budgets more closely align with workload. As long as units have plans in place to gain the necessary resources, the transition that is approved should not be classified as an exception to the policy. Rather, this should be considered a different time schedule for implementation.

Dale Pehrsson (Education) asked what an acceptable timeline would be for units that need a transition period. Francis said that this depends on the availability of resources, which vary from department to department. Brent Steel (Liberal Arts) observed that the recently approved Master of Public Policy (MPP) took three years to gain approval by all reviewing committees and additional time to implement. Departments and programs that hope to reduce reliance on the Master of Interdisciplinary Studies and implement their own graduate degrees may face similar challenges. He also described the discussions of curriculum for the MPP and said that faculty associated with that program hope to work toward minimum reliance on blanket numbered courses and to offer an increasing number of graduate standalone regular courses over time. The MPP faculty believe that this will allow a higher quality degree than one that places heavy reliance on blanket numbered courses.

Lynda Ciuffetti (Science) noted that the Council agreed to an increased number of blanket numbered credits in response to requests that were made at the open forums a year ago. To now have the policy criticized for allowing the opportunity for a larger number of credits and to have the argument described as a move to lower the quality of graduate education is frustrating. She also said that some critics of the 50% rule argue that the Council is more concerned about responding to the external accreditation report than in making progress toward improving the actual quality of graduate education. The Council needs to respond to this criticism that the change in policy will reduce the quality of education.

Francis asked how one defines quality of graduate education. She also argued that, although some programs may see the use of seminars and independent research as a reduction in the quality of education, others will see this as an opportunity to provide the essence of graduate education. The limit on blanket numbered courses is a university maximum standard. Individual departments and programs are able to include a smaller number if they believe that to be more appropriate.

Ciuffetti asked the Council members for their conclusions on the policy. Is it an improvement in quality and why? Pehrsson said that she saw it as a minimum standard for students. Barbara Bond (Forestry) argued that this policy change is an incremental step in the right direction. The Council cannot realistically require all courses to be taught at a graduate level at this time, but the policy moves OSU in the right direction. The Council has proof that slash courses do have real problems. Evidence includes the comments presented by students and some of the syllabi provided by departments as they seek new or changed courses in the Category II proposal system.

The Council agreed that the focus should be on the transition toward full implementation of the 50% rule rather than granting exceptions. Francis asked whether the Graduate School should enforce adherence to all the programs of study submitted Fall 2005 and afterwards. Ciuffetti asked whether the Graduate School should document that some fraction (perhaps 80%) of the programs of study are in compliance. Francis suggested that each department or program could set its date to achieve full compliance. After several Council members supported the idea of department or program transition plans, Prasad Tadepalli (Engineering) recommended the use of a new deadline in place of the current Fall 2005 deadline. This would reduce the complexity of approving many different plans and would remove the stigma of seeking special treatment. Selker disagreed, arguing that the wide variation in departmental resources is an argument for allowing each to set its own deadline, subject to approval.

As noted by Ciuffetti, Robert Frank (Associate Dean of CLA) suggested at the Faculty Senate meeting that the policy be reviewed two years after it is implemented. Bond said that student satisfaction is measurable and that surveys could be commissioned in the period before the policy change and again after it has been in place for some period of time.

The Council approved the use of Incremental Transition Plans (STPs), with the date of Fall 2005 for implementation of the 50% rule unless departments or programs have an approved STP.

The Council then discussed a motion to drop the previous modification of the maximum number of blanket-numbered courses on a 45-credit program of study. One Council member voted in favor of the motion to require the minimum to stay at 6 credits Fall 2005. One abstained. The others voted to continue to support the increase of blanket numbered courses from 6 to 9 if the Faculty Senate approves the 50% rule.

5. Economics Graduate Program Review Follow-Up Report

Vicki Ebbeck (Exercise and Sport Science) presented a follow-up report on graduate programs in Economics. Ebbeck and Steve Radosevich (Forest Science) visited with Starr McMullen, chair of the Department of Economics on February 26, 2004, to discuss the progress of that department in meeting the recommendations that came out of a Graduate Council review on January 17, 2000. The complete follow-up report is attached as Appendix 1.

Ebbeck emphasized the conclusions that she and Radosevich reached related to the funding needed to implement the recommendations. The fifth recommendation that the Dean of the College of Liberal Arts articulate the relative priorities of graduate education, both the majors in Economics and the role in the Master of Public Policy, and undergraduate education is the most important issue. Where are these programs headed? The Department of Economics is central to the operation of the university. Although the department has done very well working with the resources they have, they would need additional resources to achieve everything expected of them. If they must operate with current resources, which program should be given priority?

In response to a question about the severity of the problem and the need for the Graduate Council to highlight the problems, Ebbeck said that this is an appropriate time to intervene. She hoped that the follow-up report would be a stimulus for a conversation; she believes that McMullen would agree. Following additional discussion about the most appropriate way to proceed, the Council accepted the follow-up report, but asked that a cover letter be written. The cover letter should emphasize the issue raised in recommendation 5. The letter should also request that the Council be informed on planned actions to address this recommendation.

Appendix 1
Graduate Council Program Follow-up Review
Department of Economics

The follow-up review of the graduate program in the Department of Economics was held on February 26, 2004. Drs. Vicki Ebbeck and Steven Radosevich, members of the initial review committee, conducted this follow-up review. The initial graduate program review was conducted on January 17, 2000. Each of the recommendations made by the Graduate Program Review Committee were discussed with Dr. B. Starr McMullen, Chair of the Department of Economics, during the follow-up review.

In general, the faculty of the Department of Economics agreed with the findings of Graduate Program Review Committee and has worked to address the issues raised in the review report. Departmental responses to each of the recommendations made in the report are summarized below.

Personnel: faculty and graduate students

(1) Further develop joint appointments across participating UGFE departments. There have been no joint appointments since the initial review. The faculty agreed that such appointments could be beneficial to all economic units at OSU. However, appointments of this kind are difficult to accomplish because of the different academic expectations prevalent among the three departments that participate in the UGFE.

(2a) Develop a workload balance policy that permits faculty to initiate and sustain programs of research and scholarship leading to tenure or advancement in rank. A workload imbalance still exists in that faculty are overburdened with committee assignments. The teaching expectation is 16 credits per year for an Assistant Professor. The faculty, however, can schedule their courses during two terms to allow one term with no teaching responsibilities. The faculty views this practice favorably as it allows them to more fully concentrate on scholarship activities.

(2b) Consider the use of an intensive third-year review to provide new members with feedback of their progress. The Department's P&T committee conducts an intensive review of all untenured faculty by the fall term of the person's third year at OSU. The purpose of the review is constructive, providing the candidate with advice and guidance regarding strengths and deficiencies in teaching, research and

service.

(3) Develop a mechanism to solicit student feedback on curriculum, seminars and other departmental matters that involve them. At the beginning of each academic year, graduate students select a graduate student representative to represent them in departmental matters and to communicate issues to the Department Chair. Feedback from the graduate representative is invited on matters such as the curriculum and office allocation for graduate students. Graduate students recently provided recommendations for recruiting.

Future personnel needs (also relates to financial support)

(4) At least two additional evaluations seem warranted: (1) evaluation of the UGFE, perhaps as part of AREc and (2) evaluation of the undergraduate program in relation to needs, demands expectations in the Department. Graduate program reviews of AREc, Forest Resources, and UGFE have been completed. There now is a need to synthesize the information obtained from these three reviews into a consistent set of recommendations concerning the overall graduate program in economics at OSU. No review of the undergraduate program has been implemented.

(5) A prioritization by the Dean of Liberal Arts about whether graduate or undergraduate education will have greater or decreased priority in the future would be helpful to the Department. At the very least, an evaluation of the UGFE core as used by AREC and FR should be done. Although some new faculty hires have been made, no additional FTE have been allocated to the Department. It is important to the Department that priorities be established between undergraduate and graduate programs as well as between masters and doctoral programs so the unit can focus its resources and know where to direct its efforts. This issue also relates to response 4 above concerning formation of a consistent set of recommendations about the overall status of the graduate program in economics relative to the undergraduate program and other programs such as the MPP. There is still a need for greater clarity on this issue.

(6) Is it appropriate to maintain a separate M.S. and Ph.D. core just because AREc students enrolled for M.S. degrees are unable to succeed in the core offered for Economic graduate students? Perhaps AREc should provide/staff their own M.S. core or more formally swap teaching of lower division economic courses in return for graduate level core offerings. Given the diverse backgrounds of the graduate students who enter the three departments that make up the UGFE, the department supports the current core economics program. Further, the M.S. program in economics at OSU is highly competitive and students are in high demand. However, the departmental support of the existing programs was based on the expectation that additional funding would be from the College of Liberal Arts for academic hires to support Economics Department programs.

There is still a question of whether the Ph.D. program can remain competitive. The department has recently placed two Ph.D. students who specialized in econometrics in academic positions. Accordingly, the department has decided to formally offer a field in econometrics as it is obviously a strength and does not require additional resources (see 8) below.

Physical Facilities:

(7) Upgrade and/or repair computing facilities. This has been accomplished in cooperation with the Department of Agricultural and Resource Economics.

(8) Change Econ 627 from required in the Economics Department's core to an elective that can be offered in alternate years. The Economics faculty plans to continue teaching this course every year as part of their core curriculum. The problem with under-enrollment is attempting to be dealt with by changes in scheduling and some subject matter that may be of greater interest to students in other departments. The content of Econ 627 will alternate from year to year to better accommodate the diverse interests of students and attract students from other UGFE departments. This format will make the new econometrics field symmetric with the existing field offerings without requiring additional resources. It is expected that this will increase enrollment in the 600 level econometrics courses.

(9) Organize a two-course swap with University of Oregon. Logistics and cost make this an unfeasible recommendation. However, the UGFE will utilize U of O teaching faculty to teach Econ 613 during Spring 2004 via telecast supplemented by OSU student visits to U of O and U of O faculty visits to the OSU campus.

(10) Add seminars and brown bag workshops to enliven the scholarly atmosphere among economists in Corvallis. Get economists in AREc and FR to join in. Some funding is now available for this activity and

more seminars are now offered. UGFE also offers a seminar, and graduate students are required to attend a percentage of all seminars. In addition, junior faculty meet informally and socially on nearly a weekly basis.

(11) *Do not use independent study courses for fields of specialization. Continue with three field offerings: International Economics, Industrial Organization, and Natural Resources and Environment.* The faculty agrees with this recommendation and the Chair believes this is not an issue. The Department does not offer independent study courses for fields of specialization. The Ph.D. fields of specialization include two 600-level courses offered in alternate years.

(12) *Eliminate the perspectives requirement for the Doctoral Program.* This course is now dropped from the curriculum. Econ 550 (Growth and Change) is also no longer required in graduate programs because of higher teaching priorities by the faculty.

(13) *Maintaining adequate FTE in the field of International Economics.* There have been two new faculty hires in this area of specialization since the review in 2000. In addition AREc also has this as a field of specialization so students in both departments take courses in this field, alleviating enrollment problems.

Graduate instructional programs: operations and effectiveness

(14) *Tradeoffs between offering only M.S. versus only PhD degrees.* See responses 4,5, and 6 above.

(15) *Short of eliminating entirely either or both M.S. and PhD programs, there are a number of alternatives that could be considered.*

--*Terminal M.S. degree.* See response 6.

--*Common Ph.D. core for both M.S. and Ph.D. students.* The 500-level course in econometrics is required as part of the UGFE core. The faculty believes that 600-level econometrics is necessary for a rigorous, viable Ph.D. program in economics. The Economics faculty has decided to formalize a field on econometrics using the existing course offerings.

--*Joint arrangements with economics programs at University of Oregon.* See response 9.

Absent: Bermudez, Francis, Schaubert, Strickroth

Guests: Bell, Charles Boyer, Ken Funk, Doug Markle

1. Approval of Council Minutes

The minutes from the Graduate Council meetings on April 1, 2004, and April 15, 2004 were approved.

2. Category I Proposal to terminate the Master of Engineering in Manufacturing Engineering

Ken Funk (Industrial and Manufacturing Engineering) introduced a proposal to terminate the Master of Engineering in Manufacturing Engineering. This degree was approved as a joint degree between Oregon State University and Portland State University (PSU) in 1995. The program was designed to meet the needs of working professionals, primarily in the Portland, Oregon metropolitan area, who would take courses as part-time students. Most courses were taught at either Oregon State University or Portland State University and were provided to the other location through remote connections, often satellite transmission. Some courses were provided using other distance delivery mechanisms. The program graduated 27 students; no active graduate students remain. Demand for the program was lower than anticipated. Some of the courses offered at PSU did not meet the expectations of the OSU faculty for rigor of requirements. The number of students attending distance-delivered courses was too low for the revenues generated to cover the costs of education. Although the students were well served, the enrollment was too low to continue the program. Distance education is resource-extensive, especially during start-up. When Oregon State decided that it wished to terminate its participation in the joint program, PSU agreed with this decision.

Elaine Pedersen (Health and Human Sciences) asked whether the Department of Industrial and Manufacturing Engineering continues to receive inquiries from interested students. Funk said that any student with that interest is welcome to apply for the Master of Science degree. The MENG degree in industrial engineering, when it is approved, will be a good replacement, requiring fewer credit hours for students and less resources for the department to administer.

John Selker (Agricultural Sciences) inquired about objections or concerns that the faculty might have. Funk answered that no objections have been expressed. All faculty support the termination of this degree. Chris Bell (Associate Dean of the College of Engineering) added that newly hired faculty in the department were asking why the degree was still being offered.

Barbara Bond (Forestry), noting that OSU, PSU, and leadership in the Distance Education program had supported the creation of this degree, asked whether the new MENG will have similar collaborative approaches. Bell said that the School of Electrical Engineering and Computer Science and the Department of Chemical Engineering do offer some courses offered by distance delivery methods. Portland State University continues to offer a master's degree program in engineering management in the Portland area.

Bruce Rettig (Graduate School) said that, whenever a degree is terminated, any student who was in good standing at that time is provided an opportunity to complete, even with the program no longer advertised and with no new admissions being allowed. Marla Hacker, who coordinated the program in

the Portland area and who now works at the Cascades Campus, has done an exceptional job in helping all students interested in completing their degrees do so. She has commuted from Bend to Portland several times to facilitate final examinations for these students. Funk added that two students completed their degree in February of this year. Faculty at PSU, who worked closely with Hacker were most helpful in the degree completion.

Martin Fisk (Oceanic and Atmospheric Sciences) asked for more information about the role that the difficulty of providing distance education played in the decision to terminate the degree. Is this a signal that distance-education is not going to work? Funk said that the problem was related to the small level of demand for the program. They were unable to regularly enroll 8 or more students in courses, which are costly to administer. Better recruiting might have made a difference, but this program just was not able to generate sufficient funding. Fisk asked for comments on distance education in general based on the experience with this program. Bell repeated that the problem lies with a critical minimum threshold of enrollment. Funk, drawing on his experience, noted that the students were of a high caliber. He found the teaching experience to be very good although it took a very large amount of energy. Fisk asked whether more work is needed for distance education than for on-site instruction. Funk said that it is. The most difficult problem is in delivering the course initially. Teaching this way becomes easier, the more courses you teach by this method.

The Graduate Council approved the proposal to terminate the Master of Engineering in Manufacturing Engineering.

3. Electrical and Computer Engineering Graduate Program Review Follow-Up Report

On April 15, 2002, the Graduate Council conducted a review of graduate programs in electrical and computer engineering. The report of the review committee was presented to the Graduate Council on May 23, 2002. On November 12, 2003, Doug Markle (Fisheries and Wildlife) and Mark Christensen (College of Pharmacy), members of the original review committee, conducted a follow-up review (attached to these minutes as Appendix 1). Markle summarized the follow-up report for the Council with updated information on some items. He noted that the follow-up review took place shortly after the Department of Electrical and Computer Engineering had merged with the Department of Computer Science to create the School of Electrical Engineering and Computer Science (EECS). Most of the recommendations from the April 15, 2002 review were in place prior to a subsequent meeting with the Provost in 2002 to discuss the outcome of the review and were in place by the time of this follow-up review.

The report included a recommendation to develop a plan to attract the best and brightest students. In the follow-up review, Terri Fiez, director of EECS said that a plan was being developed as part of the merger. Markle said that the plan had not been developed yet. He also observed that the increase in stipends was offset by an increase in program related fees for study in the College of Engineering.

The original report included a recommendation to bring the web page up to date. In the follow-up report, a statement was made that this is now being done in the context of a web page for the merged program. Markle the names of faculty who had left the program were not quickly eliminated from the web page out of concern about obligations to those faculty members until a reasonable amount of time had passed after the faculty departed.

Selker asked whether the stipend increase came close to offsetting the increase in fees paid by graduate assistants in EECS. Prasad Tadepalli (Engineering) said that the increase in fees covers about half of the program related fee. Students shared their concerns about the fee level with Tadepalli. Bond said that ♦recruiting the best and the brightest♦ is a very passive statement unless it is backed up with a plan.

Markle said that the self-study document was generated by department leaders (Teri Fiez) with little input from other faculty. However, faculty appeared to be happy with that arrangement.

Selker said that applications from potential students from other countries, especially the countries that provide many of ECE students, have dramatically declined. Oregon State University should be much more aggressive in efforts to attract these students. He asked Markle whether he would be willing to modify the language referring to attracting the best and brightest students by reinforcing the problem associated with the total level of fees reducing the net amount of funds actually received by graduate assistants. Markle agreed to this revision.

The Council also agreed that the recruitment plan is needed now, and should not just be ♦in the

works. ♦

The Council accepted the follow-up review conditionally. After Markle makes the requested changes (increased stipend levels offset by fee increases and a need for a recruitment plan), it will be sent to Lynda Ciuffetti (chair of the Graduate Council). When she approves the changes, the revised follow-up report will be accepted by the Council.

4. Graduate Level Learning

Charles Boyer, Associate Dean of Agricultural Sciences and co-chair of the Curriculum Council, summarized the discussions of the Curriculum Council on graduate level learning issues. The Curriculum Council voted to endorse the learning outcome criteria for 500-level courses that had been adopted by the Graduate Council. The Curriculum Council also supported the establishment of the requirement that at least 50% of the credits on a graduate student's program of study be graduate standalone credits. He underlined the importance of adequate lead-time before implementation so that academic units can prepare for this policy change. The Curriculum Council also found the increased flexibility in the number of credits of blanket-numbered courses to be responsive to the challenges as departments modify their courses.

Rettig said that there is additional flexibility within the proposed policy. When blanket-numbered courses are taught as structured courses they do not count as part of the limit on number of blanket-numbered courses.

Selker said that the first reaction to these policies is that they will trigger a broad range of changes. Fisk agreed that many faculty have an initial reaction that their ability to offer courses will be sharply reduced. But, once the impact of the policies is carefully examined, that is not true.

Ciuffetti explained that the policy changes are being presented at the May Faculty Senate meeting as an informational item. The discussion at the Faculty Senate will be reviewed at the May 20, 2004 meeting of the Graduate Council. The graduate level learning policies will appear on the Faculty Senate's June agenda as an action item.

Boyer said that the Curriculum Council will support the efforts of the Graduate Council on this issue.

Dale Pehrsson (Education) recommended that Graduate Council members show support by accompanying Ciuffetti to the Faculty Senate meetings. Selker recommended that Ciuffetti provide background information and then discuss implementation issues.

In February, the Graduate Council tentatively adopted a policy on the inclusion of 400-level courses on graduate programs of study and held two open forums. Council members were asked how they wished to proceed in light of comments at those forums. The forums were lightly attended, but those present showed substantial concern about the proposed policy change. The primary concern was a perception that this additional change would lower the quality of graduate education at Oregon State University. To determine how the Council should proceed, a straw vote was held on the use of 400-level courses on graduate program of studies. Five faculty members supported the change and five opposed it. Although the Council will not proceed with this change this year, several Council members requested that additional conversations at the departmental level occur next year and that the Graduate Council continue work on this policy next year.

Appendix 1
Follow ♦ up Review
of the Graduate Council Program Review
of the
Department of Electrical and Computer Engineering

The Graduate Council Review of the Department of Electrical and Computer Engineering took place on April 15, 2002, and was presented to the Graduate Council on May 23, 2002, and later to the Provost. A follow-up review was conducted by Doug Markle, College of Agricultural Science (Fisheries & Wildlife) and Mark Christensen, College of Pharmacy (Pharmacy) on November 12, 2003.

Most of the recommendations in the April 15, 2002 review were initiated prior to the meeting with the Provost in 2002 and were in place by the time of this follow-up review. At about the time of the initial review, the Department was completing a merger with the Department of Computer Science. That

merger has been completed and the following review reflects the situation in the new Department of Electrical Engineering and Computer Science. The following summarizes the recommendations of the April 2002 review and the actions taken to date.

- Admission of unsupported students may drain resources. Faculty have agreed to reduce overall acceptance rates. Primarily, this has been reflected in a lower acceptance rate for foreign students, for example by only taking students from top universities in their country (ITI in India, for example). The Department has also initiated a new Masters of Engineering degree to replace the non-thesis, project degree. The new degree is coursework-only and should satisfy students who previously completed project-degrees. The new degree should also reduce demands on faculty mentoring time since many faculty had demanded thesis-level quality in projects.
- Assign an advisor to un-supported students. The large influx of students in the year of the review (2001-2002) had created an advising problem. The Department is now using Instructors and increasing the advising load of faculty without research funding for un-supported students.
- The Department's desire to attract the best and brightest students needs a plan. Stipends have been increased to \$1525-\$1800/month, but fees in Engineering increased to \$430/term so that total fees with health insurance are \$1313/term for Engineering graduate students. A plan is being developed as part of the merger, but details were not available. Such a plan should include a definition of best and brightest and a proactive, realistic method to attract them. Across-the-board increases in stipends are a good first step, but are probably not sufficient to attract those with high GRE and GPA scores (or other criteria used in a definition of best and brightest). Additional incentives to attract the best and brightest should be explored.
- The PhD qualifying exam needed to be more than a review of coursework. A new qualifying exam was developed as part of the merger and directly tests research capability. Students review 3-4 technical papers, review relevant literature, then prepare a white paper that presents results and research questions in the field represented by the papers.
- The content and expectations of 400/500 courses need to meet Department and Graduate Council expectations. The Department's Graduate Committee review of this subject is on-going and they expect to be able to meet any Graduate Council policy changes.
- Faculty need to work with Library to acquire relevant books in a timely manner. Librarian, Margaret Millenger, is meeting with faculty to determine the best way to serve the merged department's needs.
- A departmental seminar should be considered to foster interactions between students and external professionals and to broaden the student experience. The merged department has begun a seminar series and given it a budget to invite 5-6 top speakers each year.
- The Department needs a plan to retain faculty. Because the Department competes with an industry that pays handsomely as well as with other universities, a plan is needed to retain faculty. The Department is focusing on core areas where they can be among the best in the country and is hiring in clusters to create a critical mass of synergistic faculty in core research areas.
- The Department web page needs to be up to date. Some student criticism of the web page during the original review related to absent faculty and a perception of false advertising. The web page has been completely updated with the merger and people have been assigned to keep it up to date.

Graduate Council

April 15, 2004 Minutes

Present: Selker (Acting Chair), Collins, Fisk, Francis, Koenig, Pedersen, Rettig, Schaubert, Steel, Strickroth, Tadepalli, Waldschmidt

Absent: Bermudez, Bond, Ciuffetti, Collins, Pehrsson

Guests: Chris Bell, Tammy Bray, Leonard Friedman, David Hamby, Marie Harvey, Andrew Klein

1. Category I Proposal for a Master of Health Physics in Radiation Health Physics

Andrew Klein and David Hamby from the Department of Nuclear Engineering introduced a Proposal for the Initiation of a New Instructional Program leading to the Master of Health Physics (MHP) in Radiation Health Physics. The program will be unique. The most similar program is one offered by the Illinois Institute of Technology.

Prasad Tadepalli (Engineering) asked for a confirmation that this will be a coursework only program without a research or thesis component. Hamby said that students in the MHP will take more courses than would be selected by a student in the Master of Science program in Radiation Health Physics. However, a final, project-type course is included.

In response to an observation from Martin Fisk (Oceanic and Atmospheric Sciences) that other programs also provide the degree of Master of Health Physics, Klein agreed that this is an emerging field, but that very few alternatives currently exist. Fisk asked why the program was needed. Hamby noted that a BS degree opens opportunities to work as a technician, while a master's degree is needed to serve as a supervisor. Dale Pehrsson (Education) observed that management is a specialization that is often not included in technical undergraduate programs. John Selker (Agricultural Sciences) noted that master's degrees provide opportunities for people to change professions without earning a full undergraduate degree in the related field. In response to a question from Pehrsson about employment opportunities, Hamby suggested that hospitals would be one likely employment source.

Tadepalli asked whether employers might confuse the MHP with an MS in Radiation Health Physics. Hamby replied that this degree will be understood to be a professional degree. By providing a pathway for students wishing only courses for additional training, the Department of Nuclear Engineering will be able to provide greater focus and more strength in its MS degree programs. Selker asked whether the 7-10 students per year mentioned in the proposal would be an increase over present enrollment levels. Klein said that students are being turned away not for lack of space in courses, but for lack of funding to support research. Hamby said that his department was learning of high interest among Hewlett Packard employees who would pursue graduate study if it were not for the thesis or research requirements. The proposed program would require one and one-half years to complete and would include classes that are taught annually.

Brent Steel (Liberal Arts) asked whether a professional could take a few courses to pick up managerial aspects; Hamby said this was feasible. Selker asked how advisors are assigned and what responsibilities an advisor would have for this program. Hamby said that the advisor would discuss only academic issues. This responsibility would fall on the department's Graduate Committee. New student advising responsibilities would be divided among four faculty members. Klein said that each student will have an academic advisor for their entire career; the pattern would be similar to the advising currently provided to the department's undergraduate students. Hamby observed that the small size of the department allows it to provide close oversight for its students.

Selker said that an exit survey or some other sort of demonstration is needed that shows students' needs are being met and that they are achieving the desired learning outcomes for the degree. Language should be added that parallels language recently added to the Master of Engineering proposal.

Eileen Waldschmidt (Education) asked whether policies for professional degrees include a capstone requirement. Sally Francis (Graduate School) said the Graduate Council sets the minimum standard for all degrees. No university guidelines define the differences between a professional degree and a research degree. If the Council wants to discuss the need for such a policy statement, it should do so. Francis said that a national trend is toward new types of professional master's and doctoral degrees. How these should be differentiated from their research counterparts is not clear.

The Council approved the proposal conditionally, subject to the inclusion of requirements for program guidance and final outcomes assessment similar to the statements in the revised Master of Engineering proposal. After Selker, in his capacity as acting Graduate Council chair, agrees that a revised draft meets the Graduate Council requirements, it will be considered fully approved and ready for Curriculum Council action.

2. Category I Proposal for a Graduate Certificate in Health Care Administration

A proposal for the Initiation of a New Instructional Program Leading to the Graduate Certificate in Health Care Administration was presented to the Graduate Council by Leonard Friedman (Public Health), Marie Harvey (Chair of Public Health), and Tammy Bray (Dean of the College of Health and Human Sciences). Health care is one of the most important issues facing our nation, rural and urban populations alike. Management of health care often is provided by persons who were trained for clinical positions and who lack specialized training in management issues. They can't give up the time necessary for a MS degree. The proposed graduate certificate program will provide critically important training for these people.

For convenience and cost effectiveness, courses will be delivered either as weekend-intensive or on-line delivered courses. These methods will effectively utilize OSU faculty and experience, provide the core competencies and framework needed to enhance students' careers and allow for program completion in a timely manner. The courses are the same as those approved for Master of Public Health degree programs. Nothing brand new is being created.

Steel strongly supported the graduate certificate program, but was surprised that liaison feedback had not been received from Portland State University. Friedman said that the proposal was sent to Portland State, but no response had been returned.

Bray said that the proposed program is a creative and innovative approach designed to serve the student, not the faculty. Great support has been received for this proposal, reflecting the highly respected MPH program.

Selker asked about students currently enrolled in OSU Public Health courses. Will the fact that these courses will be delivered through E-campus with a different pricing structure pose problems for them? Friedman said that current students are working professionals; they will welcome this new opportunity. Regarding supplemental fees charged for E-campus courses, the majority of the MPH students are working full time for businesses that usually offer tuition remission as part of the benefits package. Selker asked whether employers will recognize this credential. Friedman restated the question as "Why would someone take a six-course certificate instead of a full graduate degree program?" Employers have said that the core management skills are imperative. If the students choose to continue toward a complete graduate degree, that would be great. However, the certificate will cost much less. The employers and the professionals will not need to pay for something they do not want at this stage of their careers.

Steel said that this program is a great idea especially for central and eastern Oregon. Health care professional are crying out for it. This might also recruit students into programs at the Cascades Campus. Our public health program is known as top-notch! Selker said that the program would provide substantial revenues for the department because approximately 80% of E-campus tuition goes directly to the department. Pehrsson said that the program meets the needs of professionals who want or need a graduate credential but do not need an additional degree.

Francis pointed out that the significant quality check for graduate degree programs is the Graduate Council program review, which along with the Advanced Degree Recipient exit survey, provides quality

assessment. How will Oregon State University provide on-going quality assessment for certificate programs? Hal Koenig (Business) said that the MPH advisory council meets regularly and can provide the necessary oversight.

Pehrsson asked whether a student who is following a program of study for a certificate would be required to meet program guidelines. Selker suggested that a ♦post completion evaluation♦ should be included in the proposal. Fisk said that language in the proposal suggests that the length of time to completion is totally open and asked whether this is an issue. Mary Strickroth (Graduate School) explained that this graduate certificate must follow the requirement that all courses must be completed within seven years. Continuous enrollment is also required unless the student is on approved leave. Selker asked whether the proposal should be modified to incorporate exceptions to either or both of these policies. Francis explained that Public Health could develop a planned leave policy.

The proposal to create a graduate certificate in Health Care Administration was approved. The Department of Public Health will be reminded that continuous enrollment applies to graduate certificate programs.

3. Process for Approving Delivery of OSU Programs to the Cascades Campus

Bruce Rettig (Graduate School) introduced a proposal from the Curriculum Council for a process for approving the delivery of OSU degree programs to the Cascades Campus. Francis said that the purpose for their proposal is to have one generic process for both undergraduate and graduate degree programs that are approved for delivery at the Cascades Campus. But, this would not preclude the Graduate Council requiring review procedures above and beyond the generic University process.

Elaine Pedersen (Health and Human Sciences) asked why the Graduate Council was reviewing the Curriculum Council♦s proposal. Rettig said that the Curriculum Council would like the Graduate Council to either approve their document or offer a counter-proposal. Steel read the Curriculum Council♦s document to imply that the Graduate Council was not required to approve the location of graduate programs to the Cascades Campus. Francis noted that the final step of approval is the responsibility of the Provost. The Graduate Council♦s approval is one step in the process before the Provost makes a decision.

Following discussion of issues covered in the process previously approved by the Graduate Council for graduate programs proposed to be delivered to the Cascades Campus, Council members made several motions to amend the document that explains the approval process to move or extend existing OSU degree programs to the Cascades Campus. The document as revised and approved by the Graduate Council now reads:

OSU Cascades Campus Approval Process For Existing OSU Degrees and Certificates

The extension of existing programs (degrees and certificates) to OSU Cascades is necessary for its growth. At the same time, there are issues of resources, faculty and assessment that are part of the mission of faculty governance. Each OSU department is responsible for the quality and health of its programs that are offered in Bend.

In order to make an existing degree or certificate program available at OSU Cascades, a Memorandum of Understanding (MOU) is required.

1. An MOU entitled ♦Proposal to Offer an Existing OSU Program at OSU Cascades♦ will be developed and approved by the department♦s/program♦s Corvallis-based faculty and signed by designated program administrator(s) and college deans(s)¹, along with the CEO and CAO of OSU Cascades. A library resource review must be attached to the MOU. Liaison will be conducted to departments that participate in courses typically in the programs of students in this degree.
2. Graduate program MOU♦s will be reviewed for approval by the Graduate Council and the Dean of the Graduate School.
3. All MOU♦s will be reviewed by the Curriculum Council and Office of Academic Programs.
4. The MOU will be approved by the Provost.

The review is to ensure:

1. Strength, viability, consistency of assessment, and quality;
2. Adequacy of resources;

3. Consistency with OSU policies and procedures.

The approval process will be managed through the online curriculum approval system (currently used for Category II proposals), which affords the opportunity for full Council review.

-
1. Some interdisciplinary graduate programs (e.g. Environmental Science, Interdisciplinary Studies) are located in the Graduate School. In the case of programs located in the Graduate School, the Dean of the Graduate School is the relevant officer.

Absent: Bermudez, Collins, Pehrsson

Guests: Chris Bell, Jon Kimerling, Roger Nielsen, Michael Wing, Dawn Wright

1. Approval of Council Minutes

The minutes from the Graduate Council meeting on February 26, 2004 were approved.

2. Category I Proposal for a Graduate Certificate in Geographic Information Science

Dawn Wright (Geosciences) introduced a Category I **Proposal for the Initiation of a New Instructional Program Leading to a Graduate Certificate in Geographical Information Science**. This is one of three proposals being submitted by the Department of Geosciences. The other proposals are for an undergraduate certificate program and for a non-degree or professional certificate program.

John Selker (Agricultural Sciences) asked whether the certificate program would prepare students for quantitative tasks, such as applied modeling. Wright explained that this was a proposal to transform the current minor in Earth Information Science and Technology (EIST), currently offered by Geosciences, into a graduate certificate program. Because of the limited resources to expand the courses provided, the certificate will make use of currently available capabilities. Core courses will be supplemented by elective courses totaling at least 12 credits. The elective courses may be in one of four tracks: Cartography, GIS, Remote Sensing, or Geomatics. Wright explained that the demand for the minor has been growing over the past three years. The decision to move forward with this proposal followed the November 2003 Willamette Valley GIS user support meeting.

Responding to a question about the sustainability of the program, Wright said that more students are requesting the courses in the certificate program than can be served in the available class space. Selker then asked why more resources were not being requested. If more students are attracted by the program, will additional faculty be requested? Wright said that one new faculty member will be hired to begin Fall 2004. She also noted that the purpose of the certificate is not to attract new students, but rather to take an existing minor and turn it into a certificate program to provide more appropriate professional recognition for the students.

In response to a question from Barbara Bond (Forestry) about plans to expand the program, Wright said that the participating faculty members are happy with the existing minor. There is no need to completely restructure the program because the current foundation is sound. The only growth that is expected is what may result from the courses that are offered by distance technologies. This is a rapidly evolving field and courses must be revamped frequently.

Sally Francis (Graduate School) said that a question was raised about the appropriate location of the certificate program. Because it is an interdisciplinary certificate, should it be located in a specific academic department? Wright reported that the faculty currently involved with the EIST minor want the program to be administered by the Geosciences Department. As the current coordinator of the EIST minor, she will be the person responsible for directing this graduate certificate program.

Martin Fisk (Oceanic and Atmospheric Sciences) asked for the rationale for changing a minor into a graduate certificate. Wright explained that this change reflects a national trend toward the use of graduate certificates as an appropriate credential for GIS knowledge. It provides a transcript visible credential that is becoming widely accepted in the workplace. Few universities offer a major in Geographic Information Science. Selker asked whether professional accreditation is available for these sorts of certificates. Wright said that none is currently available, but this may reflect the fact that this is a fairly new certificate. The OSU certificate program will offer points toward professional certification. Only 1/3 of such points can be achieved through coursework. Bond asked whether, if the certificate is approved and changes in national accreditation standards require a course not currently taught at OSU, it could be added later. Bruce Rettig (Graduate School) said that a Category II proposal could be used if extensive changes are required. Less substantial changes can be made by Geosciences after consultation with the Graduate School.

Bond, noting that the proposed certificate appears to be very good, asked what the difference was between a certificate and a minor. How does each fit into the University structure? Francis explained that a certificate is an official credential; a minor is not. Bond noted that a combination of a certificate and a degree seems to be the same thing as a degree with a minor. Francis responded that a certificate is a separate credential, possessing both increased visibility and marketability. It can be offered as a stand-alone credential. Bond asked how the Graduate Council should evaluate a certificate differently than it might evaluate a minor. One factor noted by Francis is the importance of a cohesive structure of courses in a certificate.

Lynda Ciuffetti (Science) said that the Council should expect to see an increasing use of certificates in a variety of disciplines. Francis said that Oregon State is responding to work force needs, which often puts pressure on the time to complete a program. OSU is lagging behind its peers in adopting certificates.

Selker expressed a reservation, arguing that although the proposal looks great, current GIS offerings do not meet the needs of research programs. A GIS class is expensive to administer and will need more resources in the future. Bond asked whether resources in Computer Science or Civil Engineering could fill some of the needs for instruction and research.

The proposal was approved with one abstention.

3. Category I Proposal for a Master of Engineering

Chris Bell, Associate Dean of the College of Engineering, presented a **Category I Proposal for the Initiation of a New Instructional Program Leading to the Master of Engineering (MEng) Degree**. The Master of Engineering degree provides an option for students to pursue advanced-level study in engineering without the requirement of either a research thesis or a project. The only requirements are courses that culminate in a final oral exam. The emphasis is on learning specific job-related knowledge and skills as currently presented in the graduate level courses currently provided in the College of Engineering. Master of Science (MS) research is resource-intensive; departments will be strapped to keep up with the demand as MS enrollments continue to increase while graduate faculty numbers decrease. Five departments are represented in the proposal. Ken Funk (Industrial and Manufacturing Engineering) did a substantial amount of work on the proposal. The proposal was distributed to the departments in the College of Engineering along with a request for comments. Few comments were received from the departments. The majority of the liaison comments came from professional societies, which argued in favor of master's degree programs with minimal requirements. Some students may enroll as early as Fall 2004. Students will be able to complete degree requirements in one year (three academic terms). The degree meets two of the university's strategic goals: providing a compelling learning experience and achieving recognition for OSU as a top-tier university. No additional library resources are needed.

Ciuffetti asked whether each department will implement the degree differently. Bell said that each department would determine whether it wishes to offer the MEng, would determine admission requirements and would make other implementation decisions. Each MEng program could vary, just as each MS program can vary. Prasad Tadepalli (Engineering) said that the individual departments need additional discussion about whether they will use the degree and how it will be implemented after the degree is made available.

Bond asked for a confirmation that the degree would have no capstone experience and that it would include only courses. Bell said that was correct. The assumption behind this degree is that many students already have work experience and want to add to education they already have completed.

Many graduate students currently take jobs without completing their degrees.

Selker asked whether this degree would be offered by the College of Engineering. Mary Strickroth (Graduate School) explained that the degree would be linked to each specific major and would be administered by the unit that offers that particular major. Referring to the section of the proposal that listed courses linked to the several majors, Brent Steel (Liberal Arts) asked whether a student could select from courses in the various units. Bell said that the allowable courses would be determined by each unit offering a major tied to the degree. Strickroth suggested that, if the College of Engineering wishes to have the flexibility of adding additional programs to the ones listed in a proposal without submitting a new proposal, language to that effect should be added. Bell agreed to add such language. Francis suggested that implementation does require time. If the Graduate Council is to move this forward quickly, the additional language is needed very soon.

Bond expressed concern about a degree that includes neither a thesis nor a research project. Tadeballi said that he hoped that few students would elect such a degree, but he noted that this option does provide flexibility to fill a need for both industry and some students. Both Elaine Pedersen (Health and Human Sciences) and Selker observed that top tier programs such as Stanford and Cornell use this degree. Francis said that she has attended many meetings where the conversation centers around the need for education to serve societal needs rather than continuing to operate in the way education has done in the past just because that is how things have been done. Rettig asked whether departments will take their responsibility to provide quality graduate education to MEng students seriously. For example, will they require that the courses include the same core courses included in MS degree programs? Tadeballi argued that a core sequence needs to be completed in such degree programs.

Steel asked who determines degree requirements. Ciuffetti concluded that many Council members would like to see a more tangible explanation of the core requirements for specific MEng programs. Bond added that units offering the degree should develop and communicate learning objectives to the students. They should also provide some way to measure the completion of the learning objectives at the end of the program.

The Council approved the proposal conditionally. Bell will receive a statement of the need to (1) provide language that provides flexibility for adding additional majors to the degree, (2) incorporate concerns submitted to Bell by Tadeballi on behalf of several Engineering faculty members, and (3) incorporate language concerning learning outcomes. Pedersen and Bond will draft the necessary language on learning objectives. Bell will submit the changes to Ciuffetti. If Ciuffetti concludes that the changes meet all three requirements set by the Council, the proposal will be considered approved as amended.

Graduate Council

February 26, 2004 Minutes

Present: Ciuffetti (Chair), Collins, Fisk, Francis, Koenig, Pedersen, Pehrsson, Rettig, Selker, Steel, Strickroth, Tadepalli, Waldschmidt

Absent: Bermudez, Bond, Schaubert

Guests: Alex Sanchez, Barbara Watrous

1. Approval of Council Minutes

The minutes from the Graduate Council meeting on January 22, 2004 were approved as amended. The minutes from the Graduate Council meeting on February 12, 2004 were approved without change.

2. Forest Resources Follow-Up Review

The Graduate Council conducted a joint review with the Cooperative State Research, Education and Extension Service (CSREES) in reviewing graduate programs in the Department of Forest Resources on March 5, 2002 (the CSREES review spanned the full time period from March 4-7). On July 24, 2003, John Walstad, head of the Forest Resources Department submitted a progress report to CSREES. That report provided the key information needed for the Graduate Council follow-up review of the Forest Resources graduate program. Barbara Watrous (Veterinary Medicine), who chaired the 2002 Graduate Council review, met with the Graduate Council to discuss the follow-up report.

The CSREES report listed 22 recommendations. Watrous commented on some of those recommendations that were of particular concern to the Graduate Council Review Team.

Review Team Recommendation 1: ♦ Resolve commitments for fixed-term faculty appointments; phase out over-reliance on such appointments; set priorities for vacant positions; and conduct full, open searches when hiring tenure-track faculty. ♦ Walstad's response was: ♦ Of the four fixed-term faculty positions in the Department, one was terminated, one was successfully converted to tenure-track status, and the faculty holding the other two positions have secured employment elsewhere. No further fixed-term faculty positions are anticipated at this time. Vacant positions are now filled according to the departmental Strategic Plan (8/2001) and Staffing Plan (3/2000) in accordance with College and University priorities. Open and competitive national/international searches are conducted for all tenured and tenure-track openings. ♦ Watrous added that the department is continuing to rely on emeritus faculty.

Review Team Recommendation 2: ♦ Faculty diversity needs to be increased. ♦ Walstad reported that one tenured female faculty member recently transferred into the department. A Black African from Ethiopia was recently hired into a tenured-track position.

Review Team Recommendation 3: ♦ Setting priorities and possibly reducing the number of courses that are taught, especially with respect to 4XX/5XX courses. ♦ Walstad noted that this was a continuing difficulty because of their small graduate student population. However, three new courses, exclusively graduate level (5XX), have been added.

Review Team Recommendation 4: ♦ Making better use of faculty in Forest Science to teach courses in Forest Resources. ♦ Walstad noted that they do enlist Forest Science faculty through guest lectures, joint courses and seminar presentations, but that the dominant research mission in Forest Science precludes much participation in teaching.

Review Team Recommendation 11: ♦Faculty believe there are critical issues on which they should be more fully involved, realizing that such matters may impact their freedom to conduct teaching and research activities. Continued effort should be devoted to the task of balancing faculty governance and administrative tasks with ongoing responsibilities in teaching and research. ♦Walstad acknowledged the challenges in this balancing effort and indicated that efforts are underway to foster greater faculty involvement.

Review Team Recommendation 12: ♦Graduate students need to have more opportunity for Internet connection beyond just access through the Harris Lab. ♦Walstad described an expansion in computing facilities for graduate students, but argued that ♦providing additional access points would be cost-prohibitive and would jeopardize the security of our network and reduce the efficiency of our computer support. ♦

Watrous also reported that Forest Resources had reviewed their graduate assistant stipends and concluded that they are adequate. However, to remain competitive with peers, this issue will be reconsidered.

Brent Steel (Liberal Arts) asked how seriously Forest Resources was taking recommendation 6, which read ♦There are no ♦social science♦ backups in the Forest [Science; sic] Resources Department as there are in some of the biophysical sciences, so perhaps these should be the first new hires. More effective use of faculty and courses from the Sociology department may improve matters. ♦Watrous agreed with Steel that this is a serious issue and needs more consideration. In Walstad's response, reference was made to the use of Sociology courses, but the Sociology Department has been caught between a loss in numbers of faculty and increasing demand for undergraduate courses.

John Selker (Agricultural Sciences) asked how the Graduate Council can confirm that the issues raised in the CSREES review were adequately addressed. Should the Graduate Council Review Team write its own follow-up report to supplement the material supplied by Walstad? Only recommendation 14, which relates to undergraduate advising, does not pertain to graduate students.

Steel was concerned about staffing problems associated with budget cuts. At the Council's request he agreed to draft an addendum to the follow-up report and to circulate it to all Council members.

The oral report from Watrous was accepted as the Council's follow-up report with the addendum from Steel. That addendum, which was subsequently approved by the Council by email reads as follows:

In regard to the CSREES Review Team Report's recommendations #5 and #6, we encourage the department and college to consider the adverse effects of budget cuts in the College of the Liberal Arts when planning future hires. There are now fewer CLA faculty to serve on graduate committees and fewer courses available for Forest Resources graduate students. This situation, in combination with increasing numbers of students and new graduate programs in CLA, will seriously affect the ability of Forest Resources to rely on social science resources (especially Sociology) outside of the College of Forestry.

3. Agricultural and Resource Economics Follow-Up Review

Alex Sanchez (Education) submitted the following report to the Graduate Council:

At the request of the Dean of the Graduate School of Oregon State University, Alex Sanchez (Team Chair) and Karen Hooker (Team Member) met with Bill Boggess (Department Head) and Rich Adams (Graduate Director) on 12/11/03 from 1:00 to-2:30. The purpose of the meeting was to review the progress made towards achieving the recommendations contained in the initial review done in October 2001, as pertains to the graduate program in said department.

The findings are as follows:

Curriculum:

- They have abandoned the Economic Development specialization and removed all references to it in the written materials.
- The number of students in courses was never really an issue♦low enrollments were for blanket or special topics courses only. They regularly have 12-15 students in core courses and 5-7 in field courses.

Master's Degree Program

- 5th year certificate program is on the back burner. They have lost faculty FTE since the review and need to be certain they can offer strong doctoral and master's programs before branching out to a certificate. To some extent this need can be met within the Master of Public Policy in CLA.
- There are several faculty members on campus with a degree in Law that could be helpful to the program, and in fact, courses are offered through the Department of Forest Resources.
- They have abandoned the development of a field of study in demand analysis or agribusiness.

Doctoral Program

- Program capacity is sustainable at 35-40 graduate students. Ideally one-third to one-half would be master's students and one-half to two-thirds would be doctoral students. Placement of students at both levels has remained strong. The master's program has declined in numbers recently partly because of the three-course sequence in econometrics, which is taught very rigorously and theoretically and which is appropriate for doctoral students but less so for master's students. Ideally they would have two tracks for these sets of courses one for each program, with the master's courses being taught with a more applied focus that depended less heavily on demonstrating proofs. At this point in time this resolution to the problem is not possible due to faculty resources. However, the faculty have revamped the courses so that they now meet three times a week instead of two with one of the meetings being a statistics lab with an instructor to help the students. This seems to be helping the situation, but there is still some dissatisfaction about these sets of courses.
- Ties with UGFE are the strongest they have been in recent history. The new department chair in Economics, Starr McMullen, has been working closely with Bill Boggess to be certain the departments are meeting the needs of the students.
- The International Trade and Industrial Organization Program is developing at an acceptable pace. Liaison with the Department of Economics is strong and students are taking courses in both departments.

Departmental Resources and Facilities

- The main problem among graduate students at the 2001 review was with the computers. Since then, Bill Boggess successfully applied for an internal grant to get funds to refurbish the computing facilities. They now have a statistics lab, new computers, and new software. There are currently no student complaints about the computers.

Administration

- Ties with UGFE have been maintained and strengthened.
- Joint opportunities for graduate programs in International Trade and Industrial Organization with the Department of Economics have developed to the point where students can take courses from both departments in this area.
- The External Advisory Group represents a diverse group of interests. They have met as a group once. Because of the difficulty in planning an agenda, which addresses the special talents of busy and highly productive people, the department head has been reluctant to call them to campus as a group. Instead they are consulted on a one-on-one basis as needed. For this same reason, the group has not been expanded to include urban-based interest groups. However, the department chair is cognizant of the need to communicate in a larger arena. Currently the plan is to have smaller External Advisory Groups in focused areas representing particular interest, which would meet on a regular basis. The groups could be brought together as needed.
- Defining a mechanism for stable instructional support is being pursued through the Budget Allocation Model. Bill Boggess is Chair of the university budget committee, so he is in a strategic position to advocate for funds for this unit.

In summary, Sanchez concluded that he and Karen Hooker were satisfied with the progress that had been made.

The report was approved.

4. Physics Follow-Up Review

Martin Fisk (Oceanic and Atmospheric Sciences) presented a Graduate Council Physics Department Follow-Up Review:

Summary of the Graduate Council Physics Department Comprehensive Review 2001

A combined undergraduate/graduate review of the Oregon State University, Department of Physics was undertaken in Fall 2001 by Paul Cull, College of Engineering and Irma Delson, College of Oceanic and Atmospheric Sciences (co-chairs), Martin Fisk, College of Oceanic and Atmospheric Sciences, Tim Kennedy, College of Engineering, Tom Scheuermann, College Student Services Administration, Carol McConica, College of Engineering, and Douglas Finnemore, Distinguished Professor, Liberal Arts and Sciences, Iowa State University. The Comprehensive Review Report was accepted by the Graduate Council in 2002.

As background for new Graduate Council members the Physics Department has experienced a decline in faculty for the past sixteen years that has weakened the graduate program. The tone of the 2001 review is indicated by quotations from the *Introduction* and the *Recommendations* sections of the review.

The *Introduction* states: ♦The Physics Department is struggling and, as a consequence, the university has a serious problem.♦ The Recommendation contains the following: ♦Oregon State University, the College of Science, and the Physics Department should give serious thought to the long term implications of permitting the erosion of a physics department at any university, but particularly at a land grant/sea grant/space grant comprehensive public research university with an aggressive agenda to push its agriculture, basic science and engineering programs to a higher profile and a higher quality location on the national landscape.♦

The 2001 Report made eleven recommendations but only the eight quoted below were relevant to the graduate program. (The others referred to the undergraduate program.) Recommendation 1 was considered of utmost importance.

♦1. Convene a panel of experts within one year to evaluate the needs of this university relative to a physics program and to make recommendations to the Provost and President on how to fulfill those needs adequately and appropriately.♦ (Note: A similar recommendation of a full evaluation of the program was made in the 1987 Graduate Council Review. That evaluation was not carried out.)

♦2. Update and implement a strategic plan.

♦3. Commit to hiring tenure track, research faculty to replace each retiree and make additional hires to increase the faculty and Department size to be commensurate with physics departments at peer institutions.

♦5. Develop protocols for assessing effectiveness and implementing continuous improvement of the service course and graduate curricula offered by the Department.

♦6. Upgrade the facilities in Weniger Hall to provide modern classrooms and laboratories for teaching and for research.

♦8. Develop a plan to survey alumni annually to evaluate the effectiveness and relevance of their degree program.

♦9. Develop, and implement, a sound affirmative action plan for faculty and students. Increase recruiting efforts; improve website; recruit underrepresented students; take advantage of potential well-prepared applicants resulting from a national economic downturn.

♦11. Convene the Department (faculty, staff, students) on a regular basis♦at least annually♦to brainstorm possible solutions to problems within its ability to remedy. It is recommended that the Physics Department administration and faculty continue to listen and respond to the needs, questions, and suggestions of their graduate students. These students♦ ideas for improvements and enhancements to OSU Physics are both perceptive and pragmatic.♦

In keeping with Graduate Council procedures a follow-up review of the Physics Department was conducted to determine what actions were taken by the department in response to the Comprehensive Review Report.

Physics Department Follow-up Review 2003

Martin Fisk and Tom Scheuermann conducted the follow-up review on December 2, 2003. They met with department Chair Dr. Henri Jansen for ninety minutes to discuss the actions undertaken in response to the each of these eight recommendations and additional issues that were in the body of the report. The responses of Dr. Jansen are summarized for each recommendation.

1. This recommendation was not implemented.
2. A draft of a strategic plan was created during Spring Term 2003 through weekly meetings of the faculty and a retreat. We were told that the draft plan includes a mission statement, strategies, and new fields for education and research.
3. Between 1987 and 2002 the Physics Department hired one new faculty member and demographics indicated that the university would have to start an aggressive hiring campaign or consider ending the Ph.D. program. *The department lost six faculty between the review in 2001 and our interview on December 3, 2003. It is now the second smallest Ph.D. granting Physics Department in the country.* Some of the retired faculty continue to teach part time, but this will end in one or two years. The Physics Department Chair stressed the urgency of hiring additional faculty before additional retirements are taken.

On the positive side the Dean of the College of Science wants to hire six faculty over the next three years and three positions are being advertised. Two offers were made to new faculty in 2002 but both were declined. On average \$350,000 is needed for startup funds for a new faculty member and even with this level of startup funds, the Chair indicated that the applicants received better offers at other institutions.

5. The Chair indicated that the faculty shortage prevents the Department from conducting the assessment of the graduate curriculum and engaging in continuous improvement of courses.
6. There are not enough resources to upgrade rooms for teaching and research. The estimated cost of upgrading a single room with water, drains, air flow, power and internet connections is \$50,000. Priorities for infrastructure repairs and improvements in Weniger Hall are: (1) internet capacity; (2) reliable electric power; (3) airflow/air conditioning. The College of Science will take over the operation of the department's web site as there is no computer technician in the department.
8. A database on graduate student alumni has not been created. Resources instead went into the Paradigms course, which is part of the undergraduate program.
9. There are more women graduate students in the department than there were in 2001 (6 women out of 38 students total). Applications from international students have declined in recent years.
11. The department did convene weekly meetings and a retreat for the purpose of determining the direction of the department. This was certainly a positive development for the department. The Graduate Council 2001 Review Report recommended increasing the level of graduate student involvement in the department. The weekly meetings and retreat would have been an opportunity for inviting this involvement, but students were not included in the discussions.

Questions drawn from other sections of the Review were related to the comprehensive exam and the balance of GRA and GTA funding. In the past year the success rate of graduate students taking the comp exam seems to be higher than in the years just prior to the 2001 Review. This may be related to better students rather than a change in the examination. During the 2001 Review students were concerned that they spent more years as a GTA than they thought they should. This is partly related to the low number of faculty so more students are needed to teach undergraduate courses and the low number of research grants which can provide research support. This will not change without the addition of new faculty.

Summary

The College of Science has made a commitment to hiring new faculty, and the department has worked to maintain a quality program while faculty numbers have decreased. Even though the College of Science has a goal of adding faculty to the department, the Physics Department is suffering from and will continue to suffer from the downward spiral in faculty numbers and program quality that has continued for the past fifteen years. This is a crisis that requires immediate and bold action by the university if it intends to have a credible graduate program in physics. It should be noted here that the existence of the graduate program currently makes it possible for the department to fulfill its role of providing service courses that are taken by over 5000 students per year. In the absence of substantial new financial resources the department can not maintain this program. The department has not, as far as we can tell, convened a panel of experts to discuss the viability of the department and its role within the university. This meeting was recommended in 1987 and was the number one recommendation in the 2001 Report, and we still think this discussion should take place. We view this meeting as an opportunity to create a plan to revitalize a department that is essential to a Carnegie Research I university.

Hal Koenig (Business Administration) and Selker asked why the panel was not convened as described in the first recommendation. Fisk said that he did not know why and reiterated that he found this to be a reasonable recommendation.

Lynda Ciuffetti (Science) asked what the next step should be. Bruce Rettig (Graduate School) explained that one problematic follow-up review recently led to Sally Francis (Graduate School) convening the department head, academic dean, the provost, the head of the program review committee, and herself to discuss needed actions.

Selker wondered why faculty have not been hired. He knows unemployed candidates who were not considered. Was there a back-up plan after the preferred candidates did not accept the position? Fisk said that the department is continuing to work on hiring new faculty.

Koenig suggested that more initiative is needed from Physics rather than relying on outsiders to identify ways to resolve their problems. Ciuffetti said that a strong comment from the Graduate Council is needed. Selker said that the department should explain why and how its graduate program is still viable.

Fisk said that Physics has identified four focus areas. He agrees that the department needs to assess these areas and determine viability of each.

Ciuffetti observed that any change in the graduate program has an impact on undergraduates as well because of the role the graduate students play as teaching assistants. Selker said that, if the graduate program is not viable, the department could hire more fixed term instructors, but this may not be the direction Oregon State wishes to take. Francis agreed that OSU does not want to see the graduate program closed.

Fisk said that Physics had conducted a retreat to help frame their contribution to the OSU strategic plan. We need to obtain a copy of material generated by the retreat including any strategic plan and hiring plan. Such a report, if one is available, along with a confirmation of hiring six faculty, could be just what is needed to make the graduate program viable. Fisk agreed to contact Jansen and ask for their plan and any hiring schedule.

Final action on the follow-up report was tabled until Fisk is able to obtain more information.

5. Graduate Level Learning

Ciuffetti asked the Council to make a decision about the upcoming forum on the possible inclusion of 400-level courses on a graduate program of study. Should there be one session or two? Should a policy be adopted before the forum or adopted afterwards to allow for more feedback? The Council decided to share the status of discussions, get feedback and discuss this issue again in April.

Prasad Tadepalli (Engineering) continues to be concerned over the decision to allow 400-level courses only after students are admitted to their graduate degree programs. If students take high-level undergraduate courses and document that they are acceptable to their department or program, why not allow such courses to be counted? Selker said that the purpose of allowing some undergraduate courses was for students who had been admitted to a graduate degree to take missing skill courses and allow them to appear on a program of study. Ciuffetti was concerned that more liberal allowance of 400-level courses would begin to dilute graduate programs. The Graduate Council should be

safeguarding high standards for graduate education.

Graduate Council

February 12, 2004 Minutes

Present: Ciuffetti (chair), Bond, Fisk, Francis, Koenig, Pedersen, Rettig, Schaubert, Selker, Steel, Strickroth, Tadeipalli, Waldschmidt

Absent: Bermudez, Collins

Guests: Donna Champeau, Ray Tricker

1. Approval of Council Minutes

The minutes from the Graduate Council meeting on January 15, 2004 were approved.

2. Final Examination Procedures for the Master of Public Health

Donna Champeau, graduate coordinator in the Department of Public Health, and Ray Tricker, also from Public Health visited the Graduate Council to discuss a request that Champeau had submitted to the Graduate School Fall 2003. The request is as follows:

"Currently, all students in the MPH program are required to complete an internship, thesis or project as their culminating experience, and all must take an oral examination that is separate from their internship, thesis, or project. We are requesting that for those students who select the internship, that they take a written examination as the final examination instead of the oral. I have attached the new department policy for the written examination. Our rationale for this change is as follows:

- Other MPH programs across the country vary with respect to a final exam. Many have written exams, some employ oral exams, and others have no final exam.
- The Council on Education for Public Health (CEPH) accreditation policy does not mandate a final exam in the MPH program. They do however mandate a culminating event for the program of study which we have declared as the internship, thesis, or project option.
- We believe that a final examination is important but believe that a written examination will better serve the department and provide consistency to the current structure. Given the nature of the program, more standardized questions can be formulated to cover the core and required areas of the program. We also believe that it will elevate the rigor of the process and serve as a better assessment of final competency for all of our students. Importantly, this will also address consistency issues with respect to evaluating all students with uniform precision.

In summary, we are requesting that MPH students who elect an internship be allow to take a written examination instead of the current oral examination. The vast majority of our students would opt for this process. Those students (fewer than 10%) who opt to do a theses or project will not engage in the written exam but will have an oral examination at the time of their thesis or project defense. Most of our students choose the internship option and therefore we anticipate that the majority of the students in our programs will be taking a written final. "

The policy itself reads as follows:

New MPH Exam Policy
Department of Public Health
Effective Fall Term 2003

Students who choose an internship in any of the OSU MPH tracks shall take a written comprehensive examination covering the five (5) core course areas and the required classes in each of their respective tracks.

- During the 2003 - 2004 year, previously enrolled students will be able to take either the written examination or the oral examination.
- Incoming students starting in the Fall of 2003 will be required to take the written examination.
- Typically the exam will be given the second Friday in October during Fall term and the second Friday in April during Spring term. Winter term exams will be scheduled on an as-needed basis. The specific date for each term will be announced in September.
- Exams will be evaluated on a Pass/No Pass basis.
- A minimum of two (2) hours and a maximum of four (4) hours will be given to complete the examination.
- All students must schedule the specific exam date (which is set by the department) with the graduate school.
- If a student should fail the exam, a reexamination will be scheduled for the next term during the normal examination time.
- Students choosing a thesis or project will not be required to take the written exam. Examination of coursework will take place during the oral defense of the project or thesis defense.

Members of the Graduate Council asked for clarification of the proposed policy. John Selker (Agricultural Sciences) asked whether students could repeat the examination if they fail it. Champeau said that a student can retake the exam the following term. Sometimes a student's advisory committee will require additional course work before the examination is repeated, but that decision is left to the individual's advisory committee. Only one retake is allowed. If the student fails the examination a second time, the student will be dismissed from the program.

Barbara Bond asked how the department arrives at measurable outcomes from a two-hour written examination. Champeau explained that MPH programs nationally are moving toward competency-based learning with measurable results. At Oregon State University, the key will be basic understanding of material taught in the core (required) courses. Dale Pehrsson (Education) asked about the process when a student fails part of a test and passes the remainder. Champeau said that students who are retaking the examination will take the entire examination.

Selker supported the use of written examinations only for the students pursuing internships. The oral examination is the better way to examine students when the central part of the examination is a capstone thesis or research project. Prasad Tadepalli (Engineering) expressed concern based on difficulties that his department (Computer Science) has had with written examinations. He supported the practice of allowing more than two attempts at an examination. He also preferred the use of an oral examination as the capstone requirement. Elaine Pedersen (Health and Human Sciences) said that a group written examination is an effective way to address the concerns about consistency of evaluation from student to student. The students may still have concerns, but the process will be more equitable. Bond agreed that anonymous grading of written examinations often is preferable to an oral examination by the student's advisory committee. Tadepalli agreed that consistency is the motive behind written group final examinations, but such examinations continue to present problems.

The request for a new examination policy for students choosing the internship option for the Master of Public Health was approved with one abstention.

3. Final Examination Procedures for the Master of Business Administration

Hal Koenig (Business) provided written background information for a request for a change in the final examination procedures used for the MBA:

Under the guidelines approved by the Graduate School, Masters of Business Administration (MBA) students take an individual oral examination during the last quarter of their program. This oral examination follows by two weeks a presentation of the integrated business plan wherein each team member is responsible for presenting a significant part of the plan, and each team member answers individual questions from the examining committee. The committee uses this presentation as well as the individual oral examination to evaluate successful completion of the MBA degree. With the increase in the number of students in the program, the logistics of scheduling students and faculty examination committees necessitated a modification to this current examination process.

As a result of a meeting in November 2002 between Sally Francis and Bruce Rettig of the Graduate School, and Sabah Randhawa, Dave Gobeli and Ray Brooks of the College of Business, a condensed schedule for the oral exam process for MBA students was proposed.

In the spring of 2003, the College of Business used the condensed format for evaluating students. Instead of a separate oral examination two weeks after the integrated business plan presentation and examination session, the length of time for the integrated business plan presentation was extended and more rigorous individual oral examinations were given at the conclusion of the presentation. The examination committee performed the same tasks, but now accomplished both the review of the team's integrated business plan and the student's oral examination on the same day. The integrated business plan presentation was extended in time (two hours beyond presentation time) to allow for appropriate examination of each member of the presentation team. The assessment process was judged superior to methods used in past years.

The College of Business requests that the final examination schedule for MBA students which was used during the spring of 2003, be approved as the examination method for MBA students.

The College of Business found that the new process was as effective as the original process, and had two benefits. First, the scheduling of examination committees and students was only done once, rather than twice. Second, with the presentation of the integrated business plan fresh in the minds of both the committee and the student, it was easy to ask theoretical questions and then move into the application of the principles as they applied to the proposed business.

In response to a question from Selker about how often students needed to be tested in a follow-up examination, Koenig indicated that this happened in approximately 10% of the cases. Selker asked what happens when a student is performing well individually, but is associated with a weak team. Koenig indicated that, in general, teams are fairly solid. Students must maintain their grades in courses. The oversight of courses in the degree program filters out non-producing students. Teams are grouped by common interest in an individual business project. Often, a business asks for a project to be set up to address a problem it is facing. Students who are interested in the problem share their interest. Teams are assembled so that each student shows an interest in a particular component of the project such as marketing, accounting, or finance. Sometimes an individual student will identify a project and other students are attracted to this person's idea. Students do have some choices. In response to a question from Selker about whether adequate time is allowed, Koenig said that experience has shown that the time is adequate.

The proposal for a change in the final examination process for the Master of Business Administration was approved, with Koenig abstaining from the vote.

4. Graduate Level Learning

During its meeting on January 22, 2004, the Graduate Council decided that additional liaison was needed on the question of using a few credits of 4XX courses on a graduate program of study. A common query was developed by Selker and Lynda Ciuffetti (Science). An example of the email survey is:

"Dear Chairs and Graduate Coordinators,

There has been interest in allowing graduate students to put a limited number of 400 level undergraduate credits onto a graduate program for the following reasons: 1. to aid students involved in interdisciplinary programs; 2) to aid entry level graduate students with specific deficiencies; and 3) to provide Departments an option to manage 400/500 level courses (e.g., "un-slash" courses that would have a limited number of graduate students enrolled). The Graduate Council suggests that the number of credits allowed as 400 level courses be 8 (sufficient for two 4 credit classes). Also considered was the option of allowing some limited 300 level courses, but the council decided that this was not consistent with a graduate learning experience, though often needed to bring a student up to speed in a new discipline.

We seek your liaison input and ask that you share this issue with the appropriate faculty in your unit. We welcome your input (see questions below) and would appreciate a response to this matter by February 10, 2004. For your information, we have attached a table that shows what our peer institutions allow. The information provided in the table was collected by the Task Force on Graduate Level Learning and updated with more recent information.

Thank you for your consideration of this important decision,

The Graduate Council

Yes, I support this concept. _____

If Yes, how many credits do you think would be appropriate?

M.S. _____ Ph.D. _____

No, I do not support this concept. _____

Additional comments: "

The comments received by the Council members follow.

Pedersen explained that her college has five departments with graduate degree programs. The opinions were evenly split between the four that responded to her. Two did not believe that 400-level courses should not appear on graduate programs of study. The two that did not want 400-level courses appearing on graduate programs of study felt that interdisciplinary programs should have the same standards as other graduate programs. They felt that prerequisites should be required of entering graduate students. Also there was a concern about student credit hour generation; there is a different formula for graduate/undergraduate course credit calculations; this proposal could result in less income. They also did not feel that graduate students should be required only to do what the undergraduates do in such courses (e.g., multiple choice tests), so it would seem that the instructors would have to provide unrecompensed labor to construct and evaluate different assignments. The last concern was that individuals with only M.S. degrees are the instructors of 300 and 400 level courses frequently; and so there is a potential conflict with having individuals pursuing the same degree in the same program instructing each other. The other two agreed that eight credits of 400-level courses would be the correct number.

Pehrsson received three responses to her inquiries in the School of Education. Two respondents, who teach in doctoral degree programs are concerned; some 400-level courses could be allowed, but they should be evaluated and controlled by the committee. Related questions that were raised included whether undergraduate courses should be allowed from another institution and applied toward a graduate degree.

Koenig said that the College of Business is organized into two "aggregate" departments: (1) Management, Marketing, and International Business and (2) Accounting, Finance, and Information Systems. One department chair did not respond and the other chair strongly supported allowing some 400-level courses.

Brent Steel (Liberal Arts) received nine responses. All departments that offer graduate programs responded. Six of them were adamantly opposed. Two said that the policy change would not affect them, but they did not want to prohibit others from using 400-level courses. Those units suggested nine credits (three 3-credit course).

Selker received one response (from Environmental and Molecular Toxicology) that was opposed to the policy change. Responses in support of the change were received from Animal Science, Soils, Bioengineering, and Rangeland Resources. The Horticulture Department had a divided opinion (most opposed, but one in favor). He emphasized that the policy change had been supported earlier by the College of Agricultural Sciences.

Bond heard responses from department heads in Forestry that surprised her. She visited with some department heads to clarify their responses and found that some of them changed their positions after the conversations. Evidently, the email message was not well understood.

Tadepalli reported that he learned little new from this round of questioning in the College of Engineering. As was the case with Selker, combining the more recent responses with earlier feedback leads to the conclusion that Engineering is generally supportive of the use of some 400-level courses. Some departments may eliminate some of the slash courses if enough 400-level credits are allowed on a program of study.

Ciuffetti reported that the College of Science leadership team has drafted a statement indicating that they support the 50% rule and recommend adoption of the following: "A limited number of 4XX-level undergraduate coursework will be allowed in graduate programs at the discretion of the student's

graduate committee if the unit responsible for the graduate program has approved that step. Because such courses vary in credit, the maximum amount of such coursework is defined as 3 courses, not to exceed 12 quarter-credits. Those undergraduate courses must be OSU-delivered. "

Ciuffetti also polled faculty and received mixed feedback. Of nine responses, two were completely against the use of 400-level credits and two supported a limited number of 400-level courses, but no 300-level courses. The concern from those who opposed the use of undergraduate courses was one of quality.

Martin Fisk (Oceanic and Atmospheric Science) said that he consulted the leadership in the Dean's Office because COAS does not have departments. Their conclusion is that they have no objections to the change, but that it would not have a major impact on them because COAS is a graduate college with no undergraduate program.

Ciuffetti asked for the sense of the Council about the need for additional liaison. The majority of the Council members favored additional consultations and began to discuss both the nature of the draft policy that would be reviewed by faculty and the process for review.

Fisk suggested that the decision about whether to allow 400-level courses within the course credits that are not graduate standalone be left to the student's advisory committee. Steel recommended that whether any 400-level courses should be on a program of study should be decided by each department or program offering degrees. He also recommended against a reference to including any 300-level credits.

Bond said that there will be some faculty who were not included in the two previous surveys. These people should be given the opportunity to be heard. Pedersen asked about the level of concern from departments that had indicated their support for the Graduate Council's draft proposal if it is not adopted following further consultation and discussion. Ciuffetti expressed concern about taking action without making an additional liaison effort. Selker noted that, given the two previous efforts at liaison, there will be "liaison fatigue" and probable minimal turnout for a forum. However, to insure that those with concerns have an opportunity to express them, he said that he strongly supported a forum. Fisk suggested that the forum include an explanation of the motivation for the policy change. He believes that the motivation is the expanding emphasis on interdisciplinary studies. Students in interdisciplinary degree programs arrive with strong backgrounds in at least one discipline, but they need lower-level courses in some other disciplines.

Additional discussion of future action led to a conclusion that the Graduate Council meeting scheduled for March 4, 2004, would be replaced with a public forum. At the next Graduate Council meeting (on February 26), the Graduate Council will adopt a draft policy or a statement of elements of a policy related to the use of 400-level courses on a program of study. Ciuffetti agreed to integrate the feedback that has been forwarded to her and present that on February 26, 2004, and asked the Council to identify the key elements of a proposal. The Council approved a motion to proceed in that manner.

Suggestions for the draft proposal included the stipulation that allowing colleges, departments, and programs to place greater restrictions on the use of 400-level courses as long as the number of credits is less than or equal to the maximum credits. Also suggested was a limit of eight credits maximum of 400-level credits. Francis suggested that the maximum be modified to refer to courses rather than credits. A suggested variant would be a limit of two courses, not to exceed eight credits. Another suggested restriction was to count only courses taken at OSU after being admitted into a graduate degree program. Some Council members disagreed, arguing that student's advisory committee members should have more discretion on whether the courses were completed at OSU and whether the courses were taken before or after admission. Discussion about these elements focused on the rationale for allowing 400-level courses. Is the purpose to allow students in interdisciplinary degree programs to take courses that are prerequisite to courses in a secondary degree? If so, should any 400-level courses be ones identified by advisory committees after a student enters a degree program? What other motives are appropriate for consideration of 400-level courses? Ciuffetti thanked Council members for their comments and indicated that she will draft a proposal prior to the next meeting for further discussion.

January 22, 2004 Minutes

Present: Ciuffetti (chair), Bond, Collins, Francis, Koenig, Pedersen, Pehrsson, Rettig, Selker, Steel, Strickroth, Tadepalli, Waldschmidt

Absent: Bermudez, Fisk

Guests: Jay Casbon, Cass Dykeman, Susan Hopp, Sam Stern

1. Proposal to Offer the Master of Science in Counseling at the OSU Cascades Campus

The School of Education wishes to offer their Master of Science in Counseling at the OSU Cascades Campus (see the appendix to these minutes, which provides a rationale for this activity, describes the resources involved and provides a commitment to administer the degree program following all policies and procedures that govern the Master of Science in Counseling at the Corvallis Campus). Faculty and administrators from both the School of Education and the Cascades Campus attended the meeting to introduce the memorandum of understanding and to answer questions from the Graduate Council.

Offering a Master of Science in Counseling was one of the three most highly sought academic programs in central Oregon identified by officials at the OSU Cascades Campus. Cass Dykeman (Counseling program in the School of Education) assured Council members that all courses would be of the same quality and nature as those offered in Corvallis. A current database lists 250 interested students, which should generate at least the 30 students required for the first-year cohort. Although Eastern Oregon University has been serving central Oregon, it does not provide the same accredited degree that is available in Corvallis and will be available at the Cascades Campus.

In addition to serving the expressed needs of citizens in Central Oregon with this particular degree, this new activity will increase the presence of Oregon State University in the area. This should help expand the enrollment in other areas at the Cascades Campus. Returning to an explanation of the demand for the Counseling degree, the point was made that there are few school counselor programs in the nation and few of them are accredited at the level held by OSU. Portland State University and Oregon State University are the only accredited programs in Oregon among the 153 accredited school counseling programs in the United States. The Council for Accreditation of Counseling and Related Educational Programs (CACREP) is very strict about compliance with standards. If this proposal is accepted, the School of Education agrees that the program must be exactly like the program currently offered at the Corvallis campus. For students, the only difference in the program is that the student will be sitting in Bend instead of Corvallis.

When asked why, with limited resources, the program is not delivered electronically, Dykeman said that the accreditation standards are strictly enforced. Although some courses can be delivered asynchronously, professional programs demand on-site faculty for close interaction between student and faculty. When asked whether the new program would reduce the numbers of students enrolled in Corvallis, Dykeman said that they could eliminate the entire current cohorts, take a new group and still continue at the same level of enrollment. There is no shortage of counselor education students; rather there is a shortage of programs for student to attend. The demand for qualified personnel exceeds the number of available graduates.

Although no faculty have yet been hired in Bend, Oregon, they will not be difficult to locate. Many Ph.D. therapists and practioners currently located in central Oregon wish to be considered. On a related issue, Oregon State University has not been able to meet the needs of Oregon, which has a shrinking pool of

teachers and educators. Central Oregon, in particular, has been underserved in the availability of graduate education in education and other skills.

When the Graduate Council reviews the Counseling MS and PhD degree programs, it will review the Corvallis and Bend programs at the same time. This is already anticipated for accreditation purposes. There is only one set of degrees; the M.S. will be delivered at two locations by one total faculty. All related policies, including admission, will be handled exactly the same way in the two locations.

The most significant concern from prospective students in central Oregon is that they will be bumped from the openings in Bend. As long as capacity exists, the students can be involved in either location.

In addition to the other benefits of this degree program, the Cascades Campus should benefit from the fact that high quality graduate programs are magnets for undergraduate programs.

John Selker (Agricultural Sciences) asked whether an undergraduate program would be launched to complement the graduate program. Dale Pehrsson (Education) explained that there is no pre-counseling undergraduate degree; students enter graduate education following a variety of disciplinary backgrounds. Responding to a question from Selker about the mix of part-time and full-time faculty, Pehrsson indicated that any faculty who are hired to participate in any aspect of the program must have full graduate faculty qualifications. In addition to some faculty hired just to teach one or more courses, one tenure-track faculty member must be in place in Bend. If the number of the students doubles, there will be a need to expand the number of core full-time faculty. In response to a question from Barbara Bond (Forestry) whether one full-time position will be adequate, considering the low salary and demands of the position, Pehrsson indicated that they will be able to hire an appropriate person. Bond suggested that the faculty member would be isolated, but Pehrsson responded that the Counseling faculty in Corvallis will hold to high standards.

When asked by Sally Francis (Graduate School) whether the applicants for the graduate program will come to Corvallis for their interviews, Pehrsson responded that Corvallis faculty will travel to Bend for the two-day admissions process. Also, the applicants are screened based on written materials; not all will be invited to interview.

Brent Steel (Liberal Arts) reported on a program at the Washington State University branch campus at Vancouver, Washington. Early in the development of that branch, there were many problems. Few of the faculty became tenured. Pehrsson responded that the core faculty of researchers in Corvallis are tenure-track and that they would help the new faculty member develop professionally. Hal Koenig (Business) asked whether this program would be cancelled if the pool of applicants for faculty positions is not strong enough. Pehrsson said that the faculty are committed to this program. Current core faculty members in Corvallis are interested in teaching in Bend.

The proposal to offer the Master of Science in Counseling at the OSU Cascades Campus was approved.

2. Graduate Level Learning

During its meeting on December 11, 2003, the Graduate Council deferred discussion of the possibility of allowing a few credits of 400-level courses on a graduate program of study. Between that meeting and the current meeting, several Council members consulted faculty members in their colleges to determine the interest in this possible change in program requirements. Lynda Ciuffetti (Science) asked Council members to share what they had learned.

Prasad Tadepalli (Engineering) indicated that most faculty found this to be a useful change. The total number of credits recommended varied by department, but the consensus seems to be that 15 to 18 credits should be allowed. Those responding did not identify any significant concerns.

Elaine Pedersen (Health and Human Sciences) found support for allowing a few credits, but indicated that this support was based on the number not being very large. Six credits was mentioned as a reasonable number.

Bond did not poll the College of Forestry, but she has discussed the issue with several faculty members. She reported that many graduate students need some undergraduate credits and that she has heard strong support for allowing some (two or three courses) on programs of study for students in interdisciplinary programs.

Pehrsson indicated that few undergraduate credits are involved in most graduate programs in the

School of Education. The responses she has received indicate that the limit be kept to a small percentage because of concerns about negatively affecting the quality of the degree programs.

Selker found support for including six to nine credits of 400-level courses on a graduate program of study. The College of Agricultural Sciences leadership group (department heads) has gone on record indicating that a maximum of twelve credits should be included. They have reported concern if the number were as high as eighteen. One department head added that he supported the inclusion of a few 300-level credits and suggested that faculty advisory committee members should determine when that is needed for special circumstances.

Koenig reported that the College of Business decided as a college to create stand-alone 500-level courses when the MBA was redesigned a few years ago. A change to allow 400-level course work would have little impact on the college.

Steel indicated that the College of Liberal Arts does not want to include any 400-level courses. Instead, they wish to place heavy reliance on slash courses while building the size of their graduate degree programs. They need that flexibility while building class sizes.

Tony Collins (Pharmacy) found no strong objections to the possibility of including some 400-level credits on a program of study.

Ciuffetti did not send a request for feedback to department chairs, but she has spoken to many people in many departments. Her sense is that several students enter graduate degree programs needing pre-requisites to the graduate courses; those courses may only be offered as an upper division course. She has found people who ask whether this change would water down their graduate programs. They were confused about the question and asked how this use of 400-level credits related to the 50% rule.

Ciuffetti asked whether every Council member should e-mail every one of their department chairs, heads, or directors in order to show adequate liaison. Selker suggested that one draft message be sent to all so that the answers could be compared appropriately. Expressing concern about the total number of credits, she asked what number of credits should be mentioned in the message. Bond observed that all Council members and many of the faculty consulted agree that eighteen credits is too high. Steel reported that Washington State University sets a limit of two 400-level courses. He also noted that WSU does not use slash courses. Francis suggested that the email include a table showing the number of credits allowed at peer institutions for reference. She also suggested using the number of credits rather than the number of courses. Bond felt that two courses (eight or nine credits) would be reasonable.

Selker asked whether allowing some 400-level courses would lead some departments to "unslash" their courses and offer some courses as 400-level only. Bond believed that it would. She argued that many botany courses are slash courses and that many students hate that arrangement. By allowing 400-level courses, the door is opened to changing the course offerings. Selker suggested that unslashing all courses would be dangerous. Students who could comply with the 50% rule without this change might find a two-course limit to be a difficult restriction to overcome.

Francis suggested that a major benefit of changing some slash courses to 400-level courses is that student expectations would be more realistic. If they expect a course to be at an undergraduate level, they are less likely to be frustrated when the course content is at an undergraduate level. Selker added that this change would allow the Category II committee to hold all slash courses closer to the requirements that are currently in place, but often not handled appropriately.

Ciuffetti asked Selker to write a first draft of the message that is to be distributed to departments, including a possible allowance of six to eight credits of 400-level courses and asking for comments. Tadepalli asked whether the request should include reference to the 50% rule. Because that requirement is creating problems in some departments, is it negotiable? Ciuffetti said that it was not.

The Council explored the possibility of identifying changes in the rule over time. Although the 50% rule and the allowance for 400-level courses might go into effect for Fall 2005, should an announcement be made that departments would be encouraged to set more rigorous standards? And should a plan be announced to set university standards that are more rigorous at a future date? The conclusion was that this would confuse an already incompletely understood policy change.

After additional discussion of strategies for seeking opinion from graduate program coordinators and

department administrators, Ciuffetti and Selker agreed to provide Council members with a message for distribution in about one week. Council members were asked to be prepared to report on the results at the next Council meeting. If possible, Council members should write a one-page summary of their findings and share it with Ciuffetti prior to that meeting.

3. Other Business

The Graduate Council discussed concerns about several recent agenda items. In several cases, materials are added or modified. Large documents are difficult to retrieve. After exploring alternatives, the Council agreed that any unit wishing to have their Category I proposal or any other document reviewed would need to provide it sufficiently in advance so that Graduate Council members could assemble their materials in one package and be able to study materials at one point in time prior to a meeting. Bruce Rettig (Graduate School) promised to address this issue. If Council members continue to be troubled with that issue, another approach will be developed.

Appendix A: Proposal to Offer an Existing OSU Graduate Program at the Cascades Campus

College: Education

Department: Teacher and Counselor Education

Degree: Masters of Science in Counseling

Rationale:

The new School of Education and Oregon State University-Cascades Campus began exploring the feasibility of offering the MS in Counseling in Bend during Spring quarter, 2003. Planning for implementation has taken place Summer and Fall 03. A database compiled from program inquiries at OSU-Cascades gathered over the last 2.5 years indicate that an MS in counseling is one of three most requested graduate programs in Central Oregon. We have over 220 names in a prospective student file and are confident we will be able to fill at least one cohort of 30 students. Moreover, offering this graduate program will be a public service to Central Oregonians as it is difficult to obtain a degree of this nature via distance learning.

Resources:

The attached spreadsheet indicates that this program will be self-supporting and may, if a new cohort is offered every additional year, produce significant income for OSU-Cascades. If, due to unexpected circumstances, we are unable to accept a cohort of 30 students, we will admit 24 students and still be able to cover our expenses. Tuition revenue was calculated on the basis of graduation tuition assessed for AY 03-04.

Admissions, Scheduling and Logistics:

All OSU admissions policies and procedures will be followed. The curriculum will be duplicated without any deviation from the nationally accredited (i.e., CACREP) program offered on the Corvallis campus. The attached schedule of classes demonstrates the successful conversion of the approved program offered in Corvallis to a three-year cohort model at OSU-Cascades for working professionals.

OSU-Cascades Campus MS in Counseling Budget for AY 04-05						
Personnel		Expenses w/ OPE	Summer 04	Fall 04	Winter 05	Spring 05
1 FTE Tenure Track		\$63,700	2 course; prog plan	2 course; prog plan	2 course; prog plan	2 course; prog plan
1 FTE Instructor		\$50,000	3 courses; advising	3 courses; advising; clinical plan	3 courses; advising; clinical plan	3 courses; advising; clinical plan
3 Adjunct Instructors (if needed to plan for clinical placements)		\$11,400				
Start-Up- computers		\$4,000				

Travel		\$3,000				
Prof.Dev.		\$2,400				
Supplies/Ex		\$2,500				
Library		\$3,500				
	TOTAL	\$140,500				
	Revenue	\$142,500	(30 graduate students- 4 terms at .50 FTE (6 crdit hours) including holding back 25% of revenue to cover costs associated with OSU-Cascades revenue-sharing model.			

Counselor Education Program Area
Department of Teacher and Counselor Education
OSU New School of Education

OSU Cascades Campus Schedule

Year/Quarter	Summer	Fall	Winter	Spring
Year 1	Counseling Theory (3) Prin. of School Coun <i>OR</i> Prin. of Comm. Coun (3)	Professional Coun (3) School/Cult Persp (3)	Developmental Persp (3) Study of Schools (3)	Group Coun (3) Classroom Instruction (3)
Year 2	Child/Adol Coun (3) Special Ed Issues <i>OR</i> DSM IV (3)	Pre Practicum (3) Cross-cultural Coun (3)	Practicum (3) Appraisal (3)	Practicum (3) Career Dev (3)
Year 3	Research Methods (3)	Internship (5) Family Coun (3)	Internship (5) Addiction Coun (3)	Internship (5) Consultation (3)
Class Times: One class is held on Mondays from 4 pm until 7 pm and hte other class is held on Wednesdays from 4 pm until 7 pm.

Graduate Council

January 15, 2004 Minutes

Present: Ciuffetti (chair), Bond, Collins, Francis, Koenig, Pedersen, Rettig, Selker, Steel, Strickroth, Tadeballi, Waldschmidt

Absent: Bermudez, Fisk

Guests: Bella Bose, Denise Lach, Don Prickel, Rich Shintaku, Sam Stern, Aaron Wolf

1. Approval of Council Minutes

The minutes from the Graduate Council meetings on December 11, 2003 were approved.

2. Category I Proposal to Terminate the Degree of Master of Software Engineering

Bella Bose, Associate Director of the School of Electrical Engineering and Computer Science (EECS), explained changes in the Oregon Master of Software Engineering program. In recent years, this program, a collaboration between Oregon State University, the University of Oregon, Portland State University and the Oregon Graduate Institute (now part of the Oregon Health and Science University) has had increasing financial difficulties. A task force established by the Engineering and Technology Industry Council (ETIC) advised Chancellor Jarvis and Vice Chancellor Shirley Clark that the program be administered by only one of the four institutions. Proposals were received from Portland State University and the OHSU. The Portland State University proposal was selected, with implementation scheduled for fall 2003. Although OSU may offer courses, only Portland State University will offer the degree once students who had been formally admitted to OSU and the other institutions complete their programs.

At present, six OMSE students are enrolled through OSU. EECS will help these students complete their degree programs, but it recommends that Oregon State University terminate its program authorization for the Oregon Master's in Software Engineering (the Master of Software Engineering, as it is recorded at OSU).

In response to a question from John Selker (Agriculture) whether there are any changes in courses offered by EECS, Bose said that there would be none. After assurances to questions from Barbara Bond (Forestry) that the program elimination would not negatively affect any OSU graduate students or other programs, Bond made a motion to terminate the MSE degree at OSU.

The proposal to terminate the degree of Master of Software Engineering was approved.

3. Category I Proposal for the Initiation of a New Graduate Instructional Program in Water Resources

Selker introduced a proposal for the initiation of a new instructional program in water resources leading to M.S. and Ph. D. degrees in Water Resources Engineering and Water Resources Science and an M.S. degree in Water Resources Policy and Management. Although water resources are important parts of research and graduate education across campus, there is currently no major with water in the title. With the degree programs included in this proposal, students will have the option of focusing on groundwater, surface water, or watershed engineering. More than 90% of the curriculum is currently in place. The program will be coordinated by a program director, who will report to the Dean of the Graduate School. The Center for Water and Environmental Stability (CWEST) will provide space for those involved in administering the program. Of the students surveyed, 47% were more interested in pursuing this degree than their current degree. Based upon advising capacity and observation of similar programs at other universities, the number of graduate students is expected to increase within three

years from its present 75 students to 150 students. Following additional remarks in Selker's review of the proposal, Denise Lach, co-director of CWEST, and Aaron Wolf, Geosciences, added more information about the strength of the proposed program and their enthusiasm for it. Bruce Rettig (Graduate School) noted that Lach is responsible for the current graduate minor in water resources and is currently responsible for identifying graduate faculty in water resources.

Bond agreed that graduate education and research is already very strong at Oregon State University. She asked what investing in a coordinator would add to the quality of graduate education in water resources. Lach argued that many well qualified students choose not to go to OSU because it lacks degrees with visible links to their interests. Because students must choose between many programs, outstanding students are not aware of opportunities that would be particularly compelling. They need centralized advising to help them find the most appropriate academic home at OSU and they need a degree name that provides them the visibility they seek. Selker pointed out that required courses in several degree programs do not allow students the flexibility to design a curriculum specifically focused on water resources; he suggested that Geosciences, which has strong programs in geography and geology and which has highly qualified water resource scientists is an example of a unit where a student might prefer to take a broader set of water-related courses in place of current program requirements.

Lynda Ciuffetti (Science) asked what the impact would be on other undergraduate and graduate programs if this degree program becomes as successful as it is described in the proposal. Selker replied that the impact would be positive because many courses are marginally offered. This expanded program will offer many courses to be offered on a more regular basis. Graduate students will still be associated with the same academic units where they are now affiliated, but their majors will no longer be the ones in which they have no interest.

Sally Francis (Graduate School) asked Selker to clarify the admission procedure. Selker explained that the admission decision must be approved both by the water resources faculty and by the academic department that is the home department of the initially assigned major professor. That department may set additional entrance requirements. Once admitted, the water resource student will become a member of that department and have access to departmental and advisor resources such as computing and office space in the same way that other graduate students in that department do. All departments that will participate agreed to this procedure; some indicated that the double admission (to a degree program and to a department home) was a necessary feature before they would approve this proposal.

Bond said that several funding issues remain. For example, at this time, graduate students in Forest Science have access to some scholarships that will not be open for students in this degree program. Selker said that colleges and departments must make decisions about whether to maintain those restrictions. And, students will need to take this into consideration as they apply for particular degree programs.

Hal Koenig (Business) said that he was concerned about the policy and management degree because so many of the listed courses are slash (4XX/5XX) courses and students must meet the requirement to include more than 50% of their credits as graduate standalone. He suggested that students will have a difficult time finding courses. Selker agreed that this was a valid issue, but argued that the curriculum in many departments has been evolving to respond to the 50% rule and that he expected a greater availability of graduate standalone courses. Koenig said that he was supportive of the water resources science and water resources engineering degrees, but reluctant to approve the policy and management degree because so many courses in that area are slash courses. Wolf argued that many departments including his own (Geosciences) are grappling with this issue and are working to separate slash courses into separate undergraduate and graduate courses. Lach pointed out that the courses Koenig is reviewing are suggested courses. Alternatives are available, but many of them are challenging for students because of prerequisites or limited offering.

After Lach and Wolf left, the Council discussed approval of the proposal. Francis asked whether the Council wished to postpone further discussion and a vote until the next meeting. The Council decided to continue the discussion. Ciuffetti asked about the way funds are allocated and the problems that could arise with this. Francis explained alternatives and described the problems facing this particular set of degrees as symptomatic of problems in offering interdisciplinary degree programs.

Brent Steel (Liberal Arts) explained how departments participating in the new Master of Public Policy (MPP) degree program (Political Science, Sociology, and Economics) have responded to the need for more graduate standalone credits. Standalone sections of the core courses are offered as standalone.

Elective courses will rotate between 400 and 500 level from year to year. He indicates that graduate education in this and other Liberal Arts departments is still relatively new. The graduate courses have room for more students; to remain viable more students are needed. Introduction of the new degree programs with their additional students will be more feasible because of actions taken to support the MPP and the additional students in the policy and management degree program will help support the MPP. Bond noted that OSU is really a top water resources graduate educational institution. Degree programs that leverage current strengths is a great idea.

The proposal to initiate a new graduate instructional program in water resources was approved.

4. Graduate Certificate in Teaching English to Speakers of Other Languages

Don Prickel, School of Education, introduced the proposal for a graduate certificate in Teaching English to Speakers of Other Languages (TESOL). As noted in the proposal, ♦ In many parts of the United States, the demand for well-trained adult English as a second language (ESL) instructors outstrips the supply (Fitzgerald, 1995). The Oregon State University TESOL (Teaching English to Speakers of Other Languages) Certificate is a graduate-level, 24-credit hour program that aims to produce practitioners equipped with a sound theoretical foundation and sufficient practical experience to be successful in the wide range of settings that offer ESL/EFL courses and programs. Candidates for enrollment in the program include recent college graduates seeking to prepare themselves to teach English while traveling abroad; current teachers from other disciplines who wish to add to their teaching repertoire; those who may have worked or currently work in the field but do not have the depth of educational background and training necessary for optimal performance in their jobs; and English teachers from abroad. ♦

Prickel emphasized the need for TESOL instructors at the community college level and the good fit between that need and programs currently offered as part of the master's degree in Adult Education. Also supporting the program is the presence of the English Language Institute, which has much expertise in teaching English as a second language to new international students who are enrolled at OSU or who wish to gain training to attend OSU or a similar university. Sam Stern, Dean of the School of Education, explained how well this involvement in aiding community colleges fits with the Community College Leadership Program, a doctoral program that trains many community college leaders throughout Oregon and adjacent states. TESOL will prosper because of those ties and it will continue to cement the ties.

Koenig asked whether the TESOL graduate certificate will be delivered on the OSU campus. Prickel indicated that the primary delivery point will be at the Chemeketa Community College in Salem, Oregon. This facility is centrally located within Oregon and has excellent facilities for the program being delivered.

When asked about available faculty, Prickel indicated that there will be no difficulty in identifying adjunct faculty for the program. Rigorous criteria will be used for identifying such faculty: The must have certification in TESOL and several years of teaching experience.

Prickel said that Education disagrees with the level of funding identified in the program assessment by the OSU Library staff. The dollars identified in the Library assessment emphasize the cost of electronic delivery, but little of the content for this certificate will be delivered electronically. The Library did identify periodicals that should be added, but this cost is not large. In response to an observation from Francis that a portion of the funds paid by students will go to support the library, Prickel said that these funds are included in the cost assessment.

Observing that the Graduate Council spent much time last year debating reducing the minimum number of credits required of graduate certificates from 24 to 18, Selker asked whether Education would like to reduce the proposal from 24 to 18 credits? Prickel said that Education and the people they consulted about this program had considered the content for this certificate at great length. An early draft included much more than is in this proposal. Education faculty believe that 24 credits, as identified in this proposal, is the minimum needed to ensure the adequacy of the training that is being provided. However, the School of Education is pleased to learn of the 18 credit minimum. Other proposals will come forward with fewer hours.

In response to a question from Steel, Prickel assured the Council that Chemeketa has excellent resources. The School of Education is grateful that this program is seen as a good joint enterprise. Chemeketa Community College is very popular and currently has a one-year waiting list for admission.

Waldschmidt explained to the Council that the current endorsement for K12 teachers is not the same thing as the proposed TESOL certificate. Although some adult educators have enrolled in some of the courses designed for K12 teachers, this program will meet an important felt need. It may also complement the current offerings for the teacher education programs.

The proposal to offer a graduate certificate in Teaching English to Speakers of Other Languages was approved.

Graduate Council

December 11, 2003 Minutes

Present: Ciuffetti (chair), Collins, Francis, Koenig, Pedersen, Rettig, Selker, Steel, Strickroth, Waldschmidt

Absent: Bermudez, Bond, Fisk, Tadepalli

Guests: David Brauner, Larry Curtis, Erik Fritzell, Jay Cason (telephone), Jim Foster (telephone)

1. Approval of Council Minutes

The minutes from the Graduate Council meetings on November 13, 2003 and October 23, 2003 were approved.

2. Environmental and Molecular Toxicology Review Report

The Graduate Council conducted a review of graduate programs in Environmental and Molecular Toxicology on September 23, 2002, as part of a more comprehensive review conducted by the Cooperative States Research, Education and Extension Service. David Brauner, who chaired the Graduate Council review, apologized for the delay in presenting the program review to the council, commenting that the review process was enjoyable and reflected a strong, viable graduate program. The graduate program reviewed is a strong, vibrant program, with dynamic and enthusiastic graduate students. Overall, the students expressed support for the faculty and courses offered. The administrative structure is efficient and the communication links are in good working order. The review document, which appears as Appendix A to these minutes, includes the following minor recommendations:

1. During our discussion with the graduate students, they noted that some minor improvements in advising could be done. Currently, the department head advises all students who don't have a major professor. Even though the department head is available most of the time to answer their questions the students felt that some sort of orientation program for the incoming students is very useful. Some students were not sure about the policy and procedures regarding qualifying exam. One student, who is currently on her third year in the program, mentioned that only very recently she found out the amount of lab resources available in the department.
2. Some students felt that it would be nice to have some teaching experience before they graduate. Even though they get this experience through their research seminars they felt it was inadequate. The department is currently in the process of creating an undergraduate degree program in toxicology. Once this happens, the graduate students should get some opportunities to TA in some of the undergraduate classes.
3. At present the position descriptions of faculty members do not include teaching. Yet they do teach graduate classes. This was not perceived as a problem currently, but potentially this could have an impact on budgeting and funding. An update of the faculty job descriptions to reflect graduate teaching responsibilities is recommended.
4. Office space for graduate students, research assistants, and post-docs, both in ALS and in Weniger Hall, is limited. The need for more office space was mentioned during the review as important. From an occupational safety point of view, offices should not be located in research laboratories.

Larry Curtis, head of the Department of Environmental and Molecular Toxicology, thanked the Council

for the positive review. Responding to recommendations, he said that a formal one-day orientation is now provided for new students. In the orientation, students are given the opportunity to meet the office staff, administration, and representatives from all four of the areas of concentration offered by the department. The department picnic was held the following day and most of the graduate students attended. A professional meeting the same week kept the students involved. The program was very successful and will be repeated next year. Because of the department's limited role in undergraduate education, they have not been able to offer opportunities for graduate students wishing to teach. The variation in teaching responsibilities reflects the history of the department, which has changed substantially since it was named the Department of Agricultural Chemistry. Office space is limited in the Agricultural and Life Sciences building and Weniger Hall.

Lynda Ciuffetti (Science) observed that the practice of establishing office space in the laboratories reflected past practice in some academic departments. Curtis agreed that the configuration of laboratories does present an occupational safety/hazard issue, with some laboratories posing more problems than others. The space in Weniger Hall is less of a problem because there are more and larger offices. Five faculty members will have future appointments in the planned Pauling Hall. If and when that building is available, more space will become available in the Academic and Life Sciences building. Erik Fritzell, Associate Dean of the College of Agricultural Sciences said that Curtis has been very diplomatic in his comments about dealing with space constraints. Both the quantity and the quality of space has improved under Curtis's leadership. John Selker (Agricultural Sciences) expressed concern about the rewards to faculty for mentoring students enrolled in interdisciplinary degree programs and in degree programs outside the faculty member's home department. Fritzell said that Agricultural Sciences believes in the value of interdisciplinary study. If you believe in it, you have to accept your responsibility to contribute even when the reward system has not been able to capture the value of your work

The review report was unanimously approved as written.

3. Graduate Level Learning

A Task Force on Graduate Level Learning, which was charged with investigating concerns of graduate students regarding courses that are offered as 4xx/5xx submitted its final report on June 12, 2001. The Task Force recommended that the slash course system be eliminated, but that 6 to 12 credits of 4XX-level courses be permitted on a graduate program of study. On January 24, 2002, the Graduate Council decided to adopt the recommendation of the Task Force, but delayed a decision on the total number of 4XX-level credits to be allowed on the graduate program of study. On February 14, 2002, the Council set the maximum number of 4XX-level credits on a program of study at 18. Because the proposal to eliminate the slash course system was not subsequently approved by the Curriculum Council and because the Graduate Council considered the two policies to be coupled, the action to allow 4XX-level credits on programs of study was rescinded by the Council.

During the 2002-2003 academic year, the Graduate Council continued to work on the problem of graduate level learning. On November 14, 2002, the Council adopted a policy requiring that 50% of all credits in any graduate program of study be graduate standalone credits. The matter of permitting undergraduate credits on graduate programs, which had been set aside after the Task Force's recommendation had been abandoned, continued to be a matter of interest to some of the Council members. Barbara Bond (Forestry) asked the Council to take up the issue of 4XX-level credits again. She argued that the 50% rule would be more acceptable to the campus community if some 4XX-level credits could be used on a graduate program of study. The current policy, slated for implementation in 2005, is that 50% of the credits on a program of study must be stand-alone courses with the remainder of the credits consisting of either the 5XX component of a slash course offered separately or graduate standalone credits. The question before the Council is whether any undergraduate credits should be allowed as part of the remaining 50% of credits that are not graduate standalone; if so, how many credits?

Bruce Rettig (Graduate School) said that it would be helpful to know, assuming some 4XX credits are allowed on a program of study, whether 4XX courses could be accepted in transfer. He indicated that the policy on this varies widely among our peers, with some institutions allowing only 4XX credits from their institution and none in transfer and others that accept 4XX credits in transfer if the credits are allowed for graduate study at the institution where the credits were earned.

Brent Steel (Liberal Arts) said that the 50% rule has major implications for both graduate and undergraduate programs. Consequently, he argued that a survey is needed. Sally Francis (Graduate School) reminded the Council that the Task Force that she appointed did conduct a campus-wide survey of the both faculty and students. In response to a recommendation from a public forum held toward the

end of the 2002-2003 academic year, the Graduate School also conducted a survey of departments.

John Selker (Agricultural Sciences) said that graduate students in interdisciplinary programs, such as those associated with the IGERT (Integrative Graduate Education and Research Traineeship) grants funded by the National Science Foundation, need to take some undergraduate courses to broaden their knowledge in areas supporting their previous education.

Francis commented on the argument that allowing 4XX courses would dilute the quality of graduate education. This issue was raised two years ago. The counter-argument then was that major professors and other members of advisory committees will continue to have authority to decide what courses they will approve on a program of study.

Ciuffetti said that she had talked with Bond, who had to miss this meeting, about this issue. Bond is in favor of allowing some 4XX level courses because the 50% rule ensures that students will have a basic amount of standalone courses. Not all courses need to be of that nature. Bond believes in "truth in advertising." If the course is 4XX level, most students will be undergraduates, but graduate students will understand this when they register. Students are more frustrated when the 5XX component of a slash course promises a graduate experience but find themselves in courses made up mostly of undergraduate students.

Ciuffetti said that she was willing to be convinced that her concerns over diluting the quality of a graduate experience were overstated, but that she continues to be concerned about the number of 4XX courses that a student would take. Elaine Pedersen (Health and Human Sciences) said that a properly taught the 5XX component of a slash course is often taught in a classroom at the 4XX/5XX level, but that additional material is provided for the graduate students.

Francis reminded the Council that the Task Force was appointed in part because of inconsistencies in the amount of additional work required for slash course graduate credit, according to student comments made during program reviews.

Ciuffetti suggested that many slash courses would remain slash courses because of the numbers needed to continue the course. In some specialties, there may not be too few undergraduates and too few graduate students to support separate courses, but the courses can be viable when both groups of students are included in the same class. She asked how many courses would remain if slash courses were offered solely as 4XX courses. Steel said that in his program, a course is offered as a 4XX standalone course one term and a 5XX standalone course the next term.

Selker said that he would like more research on faculty views on these issues. An online survey can be set up easily. Faculty could be asked to consider different options, such as the number of 4XX classes to be allowed and the number of credits to be allowed. Surveys have been used in the past with good success. He added that the survey should involve only members of the OSU graduate faculty.

Francis noted that the Graduate Council represents all the academic colleges on campus. Council members could poll their constituents before a future meeting so that they could reflect the views of their academic units when they cast their votes. They could also choose to survey faculty in their academic college.

Hal Koenig (Business) argued that there are two places our graduate students go after graduation; some OSU graduate programs feed other degree programs (students graduating with masters degrees going to other schools for other graduate degrees), and other graduates take jobs in the public or private sectors. In either situation, there will be expectations of what an MS in mechanical engineering or an MBA is capable of, and what experiences they had as part of their degree program. Koenig believes that Oregon State University does itself a disservice if faculty allow the graduate experience to be watered down and that this lack of rigor will ultimately haunt OSU; students may not be able to get into top tier graduate programs at other schools or they may not be hired by organizations and businesses. When OSU's reputation for a particular graduate program suffers, some percent of the time halo-effects will show up. That is, when a company has a bad experience with an OSU graduate from a weak graduate program, they may assume that all OSU graduate programs are weak and, in future hiring decisions, graduates from solid OSU graduate programs are not hired by that company.

Tony Collins (Pharmacy) asked whether the Graduate School should be lenient and allow the colleges to utilize 4XX courses if they so choose? Koenig argued against variable standards from college to college. As a minor professor, he does not want to be required to carry out a battle when he is reluctant to

approve courses on a program of study from departments that choose to allow 4XX courses.

Steel suggested that flexibility in the use of slash courses is valuable when developing a new program and when numbers initially are small. The bar can be raised, with requirements for only 5XX standalone and 6XX level courses when the number of graduate students in the program increases.

Koenig said the current policy includes a 50% rule. Under this circumstance, he would not be opposed to allowing some 4XX-level courses because this allows students to know what type of experience they will get from their courses. Although he could see a small fraction of the program of study including 4XX courses, he does want to preserve quality.

Ciuffetti asked the group how they felt about gathering more information. What information is needed and how should it be collected? Should each Council member consult with their individual colleges? If so, a consensus is needed. How can the same questions be posed to all faculty? Should a survey be conducted? Ciuffetti prefers the approach of each Council member consulting their individual college.

Dale Pehrsson (Education) expressed concern that the word on campus is that faculty voices are not being heard. Ciuffetti recalled attendance at the forums conducted last spring, which were very poorly attended. Her preference would be to send an email statement to the people in her college. The statement would invite comments and set a certain amount of time for the response to be submitted. Selker suggested that the disgruntled may be hesitant to speak up in a group and supported the creation of a structured set of questions to be used in an open survey.

Ciuffetti said that she needs to send a letter as part of the response to the follow-up visit from the Accreditation agency. This letter will note that slash courses are still being discussed. Further discussion of this issue was postponed until a future meeting.

4. OSU Cascades Campus Graduate Education

Jay Casbon, Campus Executive Officer, and James Foster, Chief Academic Officer for the OSU Cascades Campus joined the meeting by telephone to discuss the following process for offering OSU graduate programs at the Cascades Campus.

OSU Cascades Campus Approval Process Graduate Degrees and Certificates

It is the intent of OSU to offer graduate level work at the Cascades Campus (see Branch Campus Proposal, December 1, 2000). This document specifies the process to be followed in order to make an existing OSU graduate degree or certificate program available at the OSU Cascades Campus.

- Conversations between the interdisciplinary program director/department chair(s) of the OSU graduate program, academic dean(s)¹, the Cascades Campus Executive Officer (CEO), and Cascades Campus Academic Officer (CAO) about the rationale, resources required, logistics, demand, and scheduling entailed in launching an existing OSU graduate program at OSU-Cascades will form the basis for a proposal to offer an existing OSU graduate degree or certificate program at the OSU Cascades Campus. These conversations may be initiated by either the OSU main or branch campus.
- Agreements reached during these conversations will be formalized in a Memorandum of Understanding (MOU) titled, "Proposal to Offer an Existing OSU Graduate Program at the Cascades Campus." The MOU will be developed among the interdisciplinary program director/department chair(s) of the OSU graduate program, academic dean(s), and the Cascades CEO and CAO.
- The MOU will include signature lines to indicate approvals of the interdisciplinary program director/department chair(s), academic dean(s), the CEO, CAO, Dean of the Graduate School, the Provost.
- The MOU containing signatures of the interdisciplinary program director/department chair(s), academic dean(s), the CEO, and the CAO will be forwarded to the Assistant Provost for Academic Programs and to the Dean of the Graduate School who will transmit it to the Graduate Council for review.
- The Graduate Council will consider the following criteria in reviewing the MOU:
 - Strength and viability of the program based on the most recent Graduate Council Program Review (if available);

- Adequacy of resources available to mount the program; and
 - Ability of the program to comply with Graduate Council and Graduate School policies and procedures.
 - Upon approval of Graduate Council, the MOU will be signed by the Dean of the Graduate School and forwarded to the Provost for approval and signature.
 - With the approval of the Provost, the CAO will take actions necessary to implement the program at the Cascades Campus.

¹ Some interdisciplinary graduate programs (e.g. Environmental Science, Interdisciplinary Studies) are located in the Graduate School. In the case of programs located in the Graduate School, the Dean of the Graduate School is the relevant officer.

Francis said that Oregon State University is now at the point of being ready and interested in launching some existing graduate programs at the Cascades Campus location. The proposed procedure outlines the approval process for doing so. Feedback from the Council was requested.

Casbon said that the Cascades Campus agrees to follow the protocol exactly. They consider themselves to be part of Oregon State University, simply operating in a different location. Central Oregon needs the ability to deliver graduate programs. The OSU Cascades Campus strategic plan will include this protocol.

Selker asked about the strategy for implementation of graduate programs. Are the logistical problems being considered? Casbon replied, saying that they will conduct a needs assessment. Focus group meetings are taking place now. The number of inquiries about graduate programs received in Bend reflects a felt need, motivating the Cascades Campus officials to initiate discussions with the departments whose graduate programs are involved.

Foster observed that, in the case of the Master of Science in Counseling, which is the first program being planned for delivery in Bend, Oregon, requirements of the accreditation process will drive the faculty decisions. The ideal arrangement for that program will be to offer an on-site program with a minimum of distance courses needed.

Francis indicated that the document under discussion is a protocol. Each degree program delivered will be individualized by special circumstances and will be reviewed by the Graduate Council. Casbon agreed; the central concern is that all the appropriate players, including the Graduate Council, be kept in the loop to make informed decisions. Ciuffetti asked whether Casbon and Foster will come to Council meetings when programs are reviewed or whether they will be connected by telephone. Casbon indicated that he and Foster would attend Council meetings unless weather conditions prohibit this.

Selker, noting that existing programs will be available in Corvallis, year in, year out, asked whether the programs in Corvallis and Bend will be linked. And, will the graduate program reviews be closely linked? Casbon said that this will vary by program. He and others welcome the opportunity for sharing teaching responsibilities between campuses. The programs would be available on site in Bend to generate a critical mass of faculty, but they would be linked to the Corvallis campus. Francis said that graduate program reviews will include both locations that are associated with the program into one review. Casbon said that accreditation is extended to Oregon State University as a whole, but it recognizes two locations. Francis added that video conferencing or a visit to the Cascades Campus location could be incorporated into the reviews.

Casbon asked about the next steps. How do they get on the Graduate Council calendar? Rettig said that he will contact people involved with the Counseling degree program and Cascades Campus officials to determine the earliest possible date. Selker said that, to be successful, synergy and cooperation will be needed between Cascades and Corvallis. Koenig added that the demand on available resources will be a critical question. Francis agreed that a review is needed to determine whether the resources will be adequate.

The protocol was approved as presented. Dean Francis will share it with Provost White.

5. Other Business

Rettig, observing that the Council has sometimes needed a full hour for presentation and discussion of agenda items, asked how to handle a backlog of issues needing attention. How comfortable is the Council with working on more than two major items in one meeting? Francis said that two follow-up review reports are currently available for Council attention. Could the Council delegate responsibility to

specific Council members to research and present to the other members? Pedersen thought this would be possible for follow-up reviews, but not for consideration of Category I proposals. Ciuffetti observed that she sometimes senses that she sometimes cuts discussions short, but if others disagree, discussions can be speeded up. Selker said that the Council does not want to be a bottleneck when several groups must wait to take their role in proposals. It is only one of several steps; delays slow down the whole process.

Ciuffetti said that the Council could limit the amount of time for guests to make presentation. Francis supported Ciuffetti's recommendation and added that, if there are specific questions for visitors, someone could collect the questions and present them to the guests. Pederson noted that sometimes she and others are not able to review materials until shortly before a meeting; this limits the ability to plan questions in advance. Ciuffetti accepted that observation and agreed to the process of setting time limits and sticking to them.

Pehrsson said that she reviewed reports in advance and does not think it necessary for the reports to be read verbatim during the meeting.

Appendix 1
Graduate Council Program Review
Department of Environmental and Molecular Toxicology
College of Agricultural Sciences
Oregon State University
Fall 2002

Introduction

The graduate program review of the Department of Environmental and Molecular Toxicology took place September 23, 2002. The Graduate Council review team conducted the day-long review in concert with a CSREES review team, which met with the department from September 23rd to September 25th. The Graduate Council review team members were:

Internal Reviewers:

- David Brauner, College of Liberal Arts (Anthropology)
- Bella Bose, College of Engineering (Computer Science)
- Carol Caughey, College of Home Economics and Education (Apparels, Interiors, and Merchandising)
- Donald Prickel, College of Home Economics and Education (School of Education)

External Reviewer:

Marion Miller, Department of Environmental Toxicology, UC/Davis

Sally Francis, Dean of the Graduate School and Bruce Rettig, Associate Dean of the Graduate School also participated in the review. During our site visit the Graduate Council team met with Thayne Dutson, Dean, College of Agricultural Sciences, Larry Curtis, Department Head, most of the Environmental and Molecular Toxicology faculty, and about 10 graduate students. A very thorough self-study report was supplied to the review team prior to our site visit by Dr. Curtis. The following report was generated from data supplied in the self-study document and information gleaned during the site visit.

Although we were unable to get feedback from our external reviewer, comments from members of the CSREES team were extremely favorable concerning the quality of the graduate program from a national perspective. The Graduate Council review team also found the graduate program in the Environmental and Molecular Toxicology Department to be strong and vibrant. The quality of the graduate students, faculty, and administrators is exemplary. The level of funded research and graduate student involvement in the department's research program is excellent. The department's facilities are good and getting better. The few areas where improvements are recommended by the review team are enumerated at the conclusion of this document.

Graduate Curriculum

Curriculum and Course Offerings

Graduate students in the Environmental and Molecular Toxicology Department receive intensive coursework

in one of four concentrations. These concentrations are: Cellular and Molecular Toxicology, Environmental Chemistry and Ecotoxicology, Mechanistic Toxicology, or Neurotoxicology. Sample programs illustrated a minimum of 45 hour MS and 108 hour PhD. course work commitments within each concentration. Each concentration includes a sequence on Ethical Issues in Research. Each concentration draws graduate course work from other departments surrounding a toxicology core tailoring the individual students needs and the program's objectives. The self-study document (and 02-03 catalog) lists nineteen graduate courses offered by the Environmental and Molecular Toxicology Department. Five of the 500 level courses are split 400/500 courses. Seven courses are stand-alone 500 level courses. Seven 600 level course offerings are also offered. Based on the sample programs provided to us and the number of stand-alone graduate courses offered by the department (and closely allied departments), the new 50% rules adopted by the Graduate Council will not be a problem for this department.

Students and Advising:

Overall, the quality of the students currently enrolled in the program seems to be very good. There are thirty-three students currently enrolled. Most of them are in the Ph.D. program. Recruitment of new students is mainly done through the description of the program on the department web site. The admission to the program is very competitive. During the academic year 01-02, forty-nine students applied to the program and initially only six were given admission, of which only one declined the offer; then one more student was admitted. All these students are currently in the program. Thus, the acceptance rate of the applicants to the program is very high. All admitted students in the program are financially supported by the training grant or the research grant of individual faculty.

During the review, the graduate students expressed their views very frankly and exhibited a fine level of professionalism. Overall, the graduate students are very happy about their studies and the strong support and guidance they receive from the faculty. However, they felt some minor improvements in advising could be done. Currently, the department head advises all students who don't have a major professor. Even though the department head is available most of the time to answer their questions, the students felt that some sort of orientation program for the incoming students is very useful. Some students were not sure about the policy and procedures regarding qualifying exam. One student, who is currently on her third year in the program, mentioned that only very recently she found out the amount of lab resources available in the department.

Some students felt that it would be nice to have some teaching experience before they graduate. Even though they get this experience through their research seminars they felt it was inadequate. The department is currently in the process of creating an undergraduate degree program in toxicology and once it is formed the students may get some opportunities to TA in some of the undergraduate classes.

Faculty

Staffing

There are seventeen professorial faculty representing the Environmental and Molecular Toxicology Department within the College of Agricultural Sciences at Oregon State University. Four faculty members hold the rank of Assistant Professor. There is only one Associate Professor. Eleven faculty members hold the rank of Professor and one member of the faculty is a Distinguished Professor.

A review of faculty vitas demonstrates a department of nationally recognized scholars, with an above average number of research grants. The Department of Toxicology is to be commended for its contemporary research and scientific study in toxicology and its continued publication record in peer reviewed journals as well as presentations before national conventions and conferences.

Collaborative Efforts

In addition to the eleven faculty affiliates, staff from a variety of university programs (such as Chemistry, Biophysics, etc.) provide additional research support, instruction, and consultation to the professorial staff. They bring a unique set of expertise from outside the university community, representation being from such reputable organizations as the OSU Extension Program, Oregon Health and Sciences University, the Linus Pauling Institute, The Center for Gene Research and Biotechnology, Marine/Freshwater Biomedical Sciences Center! and the Environmental Health Sciences Center.

Administration:

Leadership

The Department of Environmental and Molecular Toxicology is located within the College of Agricultural Sciences, under the direction of Dr. Thayne Dutson, Dean and Dr. Roy Arnold, Executive Associate Dean, and

Dr. Lawrence Curtis, Department Head. It is evident that the clearly articulated mission of this department, and the working relationships between these managers have resulted in a quality program.

Funding Operations

While there is a seriously small number of funds generated by the approximate 1.3 FTE dedicated to instruction, operations for research and scientific study are largely supported from research grants.

Collaborative Programs

The research and scientific investigation of faculty and staff are enhanced by their affiliation and collaborative efforts with three major research centers: The Linus Pauling Institute, Marine/Freshwater Biomedical Sciences Center, and the Environmental Health Sciences Center.

Management

Each faculty member appears to have great autonomy at managing his or her own areas of research. They are hired on the basis of the expertise needed by the Department, and for this reason, contribute to the needs and mission of the department across the college and university. There is evidenced and high sense of morale and camaraderie among staff. Most possess their own individual laboratories for conducting their respective research. They are able to hire and manage their own research assistants, most of whom are graduates in study (masters and doctoral level). The Department Head appears to supervise from a collaborative distance, fully relying on the expertise of the faculty to create a quality program.

Support Staff

Three staff members are employed to coordinate and manage the daily office activities. All three expressed their praise for the supportive management style of their department head, Dr. Curtis. There also appeared a very relaxed and supportive working relationship among all three. Students also voiced their praise of these three staff members, in terms of their ability to meet the needs of the students.

Instructional Curriculum Design

Because of the designed focus on research, some staff may have fewer demands on teaching and instruction of graduate students. Other faculty may have a greater demand on their time in instructing and teaching of classes as compared to time spent in conducting research. It is suggested that a review of teaching load be conducted to provide feedback as to any levels of inequity of faculty time.

Facilities, Budget, and Library

Facilities

Most of the laboratory and office space for the Department, including the main office, is housed in the Agriculture and Life Sciences (ALS) Building. In addition, laboratories and offices for several faculty members are located in Weniger Hall. The National Pesticide Information Center occupies about 2,600 square feet in Weniger Hall and was recently remodeled to include 24 workstations to facilitate efficient Internet and telephone communication.

Faculty members housed in ALS are provided with laboratory and office space; but office space for graduate students, research assistants, and post-doctorals, both in ALS and in Weniger Hall, is limited. The need for more office space was mentioned during the review as important. From an occupational safety point of view, offices should not be located in research laboratories. Dr. Anderson's lab, however, is certified as a Good Laboratory Practices (GLP) lab, so no offices are included within it.

Members of the faculty mentioned that more of Weniger Hall would be renovated for their use, so the review teams were not told of extreme deficiencies in space for research within the portions of the buildings used by the Department.

In the future the University plans to build Pauling Hall, which will house the Linus Pauling Institute, as well as several of the Centers such as the EHSC.

In addition, Dr. Curtis has the funds to build a "barrier facility" for research with mice, which will be viral-free and bacteria-free. This facility would be ALAC accredited, and would be the only one on the OSU campus. For now, the Department has a Thorne apparatus, a metal box which functions similarly to an isolation facility.

Budget

During the past six years, the Department's recurring budget shows the following: the Agricultural Experiment Station budget has increased by approximately \$928,000, from \$1,069,269 in the 1996-97 academic year, to \$1,997,368 during 2001-02. The Department's Academic Programs budget has increased

during the same period by almost 8 times, from \$72,848 to \$556,283. The Extension budget has increased from \$207,376 to \$383,598. Total recurring expenditures for the Department have increased in the same six-year time period from \$1,352,762 to \$2,673,279. Extramural funding in the Department during this time has increased from \$3,099,831 to \$3,899,321.

At present the position descriptions of faculty members do not include teaching. Yet they do teach graduate classes. This was not perceived as a problem currently, but potentially this could have an impact on budgeting and funding.

Library

Dr. Curtis has assessed the holdings of the Valley Library in the field of toxicology and the supporting basic sciences as good. His concern for the future is that the number of online subscriptions should be increased. He feels that the staff of the Library makes a very good effort to stay in touch with the changing needs of the Department. This assessment represents a considerable improvement from the report of the Toxicology faculty members to the review team in 1993.

Concerns and Recommendations

1. During our discussion with the graduate students, they noted that some minor improvements in advising could be done. Currently, the department head advises all students who don't have a major professor. Even though the department head is available most of the time to answer their questions the students felt that some sort of orientation program for the incoming students is very useful. Some students were not sure about the policy and procedures regarding qualifying exam. One student, who is currently on her third year in the program, mentioned that only very recently she found out the amount of lab resources available in the department.
2. Some students felt that it would be nice to have some teaching experience before they graduate. Even though they get this experience through their research seminars they felt it was inadequate. The department is currently in the process of creating an undergraduate degree program in toxicology. Once this happens, the graduate students should get some opportunities to TA in some of the undergraduate classes.
3. Because of the designed focus on research in the department, some faculty may have fewer demands on teaching and instruction of graduate students. Other faculty may have a greater demand on their time in instructing and teaching of classes as compared to time spent in conducting research. It is suggested that a review of teaching loads be conducted to provide feedback as to any levels of inequity of faculty time.
4. At present the position descriptions of faculty members do not include teaching. Yet they do teach graduate classes. This was not perceived as a problem currently, but potentially this could have an impact on budgeting and funding. An update of the faculty job descriptions to reflect graduate teaching responsibilities is recommended.
5. Office space for graduate students, research assistants, and post-docs, both in ALS and in Weniger Hall, is limited. The need for more office space was mentioned during the review as important. From an occupational safety point of view, offices should not be located in research laboratories.

Graduate Council

November 13, 2003 Minutes

Present: Ciuffetti (chair), Bond, Collins, Fisk, Francis, Koenig, Pedersen, Pehrsson, Selker, Steel, Tadepalli, Waldschmidt

Absent: Bermudez, Rettig

Guests: Tammy Bray, Cheryl Jordan, Hal Salwasser, Steve Tesch, Barbara Watrous

1. Approval of Council Minutes

The minutes from the Graduate Council meetings on October 9, 2003 and October 23, 2003 were approved as distributed.

2. Forest Engineering Review Report

Barbara Watrous (Veterinary Medicine), who chaired the Graduate Council review of the graduate degree programs in the Department of Forest Engineering on April 14, 2003, introduced the review report. The summary of the findings and recommendations follow. The remainder of the report is attached to these minutes as Appendix 1.

Summary of Findings and Recommendations

Findings:

The College of Forestry at OSU is recognized as the top forestry institution in the world. The Department of Forest Engineering is also premier in its discipline. Despite the presence of approximately 47 SAF (Society of American Foresters) accredited programs currently in the United States, with a decline in the number of FE programs at other universities in the past 12 years, this department is among a limited number of existent programs in the US. The faculty and research program are internationally recognized as leaders and the forestry extension service is one of the best in the country.

There are three degree programs: Master of Forestry, Master of Science and Ph.D. degrees in either Forest Operations, Forest Engineering, Forest Hydrology or Forest Soil Science. In practice, the MF and MS degrees take a similar time to completion and there may be little differentiation between professional paper and thesis requirements. While identification of a major professor occurs prior to admission of a graduate student, the make-up of the student's Graduate Advisory Committee may take more than two terms, resulting in a delayed plan of studies and potentially needless course work. If a mismatch of student and major professor occurs, some students have difficulty changing the major professor, despite the paperwork that indicates the ease of the process, assuming another professor is willing to undertake the student's program.

Graduate level learning may be less than optimal in some of the fields of study. There may be a large number of 4xx/5xx courses used to meet the core requirements in an advanced FE degree that may have also met the undergraduate curriculum needs.

Students express disagreement on their satisfaction of orientation and advising. Some MF graduate students also feel there exists little difference between the expectations by major professors of MF and MS degree courses of study and rigor of the paper requirements.

Four new graduate faculty have been hired in the past three years. Three replaced positions were vacated by retirement. The Richardson Chair is a new position. There is a proposal to add forest soil science to the graduate degree options. However, the graduate degree program has shrunk slightly in the last decade. The numbers of hydrology majors are increasing with a commensurate decline in majors in forest operations. Faculty demographics lack diversity. They are predominantly trained at this university, are all white and male. Among the graduate students there is an increasing female population concurrent with worldwide interest among the applicant pool; however, there is no racial, despite the increasing diversity in the youth of Oregon and the Pacific Northwest. In addition, the lack of female faculty to mentor the female graduate students results from the gender discrepancy in faculty ranks.

Funding for graduate students is exceptional and, in addition to the departmental prestige and high quality of the faculty, is one of the primary reasons that attract graduate students to the FE program,. Stipends are limited to Graduate Research Assistant positions. There are no Graduate Teaching Assistantships even though several students express an interest in teaching, whereas other graduate students have little to no interest in teaching. If the lack of Education and General Funds prevents establishment of Graduate Teaching Assistantships, the use of graduate students on an individual basis by expressed desire might be pursued.

Data on retention and dropout rates are not clearly maintained. While employment opportunities are exceptional and students may drop out to pursue job offers, tracking those students with intentions of completing their degrees is not thorough.

Recommendations:

- Continue to maintain Departmental and College strengths, including premier faculty and research activities, facilities, great working relationships between the COF departments and with other OSU colleges and departments.
- Work toward a more timely process of Graduate Advisory Committee member identification to expedite development of course of study. In addition, graduate advisors should help monitor course offerings so as to minimize delay in curricular completion.
- If a mismatch exists between the graduate student and major professor, work toward resolving the differences or facilitate identification of an alternative director of the graduate student.
- Address the student concerns of lack of rigor in course work by reviewing the offering of 4xx/5xx courses and assure a graduate level of learning.
- Requirements and expectations for the MF degree as described in the Graduate Student Handbook need to be followed or if changed, they need to be better communicated to the applicants and incoming students. Alternatively, convert the MF option to a course work-only program to allow completion by self-funded students within as little as one year.
- Provide a college-level orientation for incoming students to gain understanding of forestry and activities within the College.
- The Department needs to focus on increasing its diversity. The "grow your own" philosophy to expand faculty diversity is not perceived as the best approach. The department should develop a strategy to determine how to attract outside faculty hires and inquire of other Forestry departments to determine how they were able to achieve "new blood." Commitment to diversity may require hiring of an individual who doesn't match the current departmental mold and could lead to the bonus of expansion of research interests.
- Maximize the utility of the Department web site for recruitment to build diversity in the

student population. Enhance visibility of the programs by participating in outreach programs and professional organizations to encourage women and minorities in science.

- Establish a mentoring program for the female graduate students.
- Continue to maintain levels of funding for graduate students including nominating students for competitive college and university-wide fellowships. Pursue options for GTA positions for those students interested in teaching.
- Expedite the admissions process.
- Be more proactive in identifying long-term research needs that integrate a wider range of resource issues and values and expand the hydrology and watershed research to involve all land-use regions, embracing the "ridges-to-reef" perspective identified in the OSU 2007 discussions.
- Recognizing that the research activities conducted by graduate students serve as the foundation of the Department's research program, it needs to attract additional M.S. and Ph.D. students to maintain and strengthen its program. Comments proffered by members of the CSREES team suggested that current resource levels in the FE Department could support an additional five to six graduate students per year.
- Greater emphasis on multi-collaborator competitive grant funding is needed in the future. Development programs and rewards are suggested to encourage faculty to compete for larger research projects that integrate many natural resource issues and require long-term, major funding. Collaborations with investigators either at OSU or elsewhere that have had past grant success might improve competitive grant acquisition.

Steve Tesch, head of the Department of Forest Engineering, thanked the review team for their efforts. He was pleased to receive praise and to have the department's successes recognized. He noted that funding has been received that will allow another endowed professorship. The department is currently working on a strategic plan. Many of the issues raised in the review report are focused on in the strategic plan. The department recognizes the challenges it faces in attracting MS students wishing to emphasize the areas of harvesting and operations. Doctoral students are in high demand. There are challenges in enrollment due to limited funding for research assistantships, but the department is working to secure additional funding including support for externally supported fellowships. The department has delayed acting on the large number of slash courses while waiting for clarity on the university policy on the slash course issue. To add more graduate-only courses, the department needs to increase the number of graduate students. The department believes that both the Master of Forestry and the Master of Science should reflect similar times for degree completion. A coursework-only master's degree program in Forestry is being considered.

Tesch reviewed the problems of limited diversity, which present a major challenge to Forest Engineering. The faculty is currently all white males and the student population is only slightly more diverse. The minority pool consists primarily of international students. With seven or eight fellowships available, the department can focus on targeted recruiting. Seven faculty hires have taken place since Tesch has been department head, but the department has been unsuccessful in increasing diversity, largely because the applicant pool has not been very diverse. Tesch posed the question of how the department can develop a more diverse pool. Perhaps the answer is by growing our own (i.e., recruiting graduate students from the OSU undergraduate student body and recruiting OSU faculty from OSU graduate student populations). The Department has been successful in recruiting faculty with research and teaching skills by attracting OSU graduates who return to teach at OSU after gaining valuable work experience elsewhere. Several new faculty members have been hired in the last few years; they are in the process of learning about the University and which classes across campus are available for their students. This is a challenging learning curve for them. All faculty are challenged in selecting courses from outside the department because many courses are cancelled quite late. How can one faculty member stay abreast of these changes as they assist students in choosing courses? Departmental graduates with master's degrees have been targeted for staff positions in government.

The department has been in the midst of curriculum review and accreditation for the past five years. There was a strong focus on undergraduate programs and the need to bring them up to date. Faculty energy is now being focused on the graduate level. In response to questions about teaching opportunities for graduate students, Tesch indicated that department resources do not provide for teaching assistantships, only for research appointments.

Hal Salwasser, Dean of the College of Forestry, said that he and others were aware of the diversity issue and were continuing to explore ways to address it. Among the options being considered were to allow searches that would be open to more local applicants instead of focusing so strongly on external applicants and to redefine job descriptions with an intent of making the positions more attractive to female and minority faculty applicants. The Department does have an exceptional track record for productive research by hydrologists and other engineers. The recently hired faculty members are impressive; they will bring much excitement and energy to the department.

Half of the graduate students in the department are on fellowships. Research throughout the College of Forestry, particularly in the Department of Forest Science, is funded by formula funds. This has both good and bad aspects. The greatest problem is that the Department is not focused enough on other funding sources. Salwasser described positive developments across the University in research and education related to water, including forthcoming degree proposals in water resource science and water resource engineering. Forest Engineering, as a separate discipline, is in the decline across the United States. Nobody on the Pacific Coast matches our caliber in forest management. Hydrologists and engineers will be increasingly needed as the available forest resources continue to diminish. Oregon State University has and will continue to have the best of the programs in the United States. The program in Forest Engineering is heading in the right direction as faculty and student quality continue to rise.

In response to Graduate Council questions about initiatives for recruiting for greater diversity, mention was made of a new partnership with Weyerhaeuser and Chemeketa Community College designed to recruit Hispanic students into the forestry program. Related efforts include the tracking of people who have attended OSU but have not completed their degrees. They hope to bring these students back into their programs. The Department has been frustrated with attempts to keep track of such students in the past and hope that continuous enrollment may make student intentions clearer.

Responding to more questions about slash courses, Tesch noted that most of the hydrology classes (all but two) are at the graduate level. Forestry operations is the area where addressing limits on slash courses will post the greatest challenges.

Tesch was asked about distance education activities. He indicated that this is a huge opportunity for Forest Engineering, but sees problems with assigning scarce resources to developing those new initiatives. Many students would be likely to participate in courses offered by E-campus, but investments would be needed before this effort would become self-supporting. Nonetheless, this is a great opportunity to provide leadership in education across the country. Currently, the new faculty are establishing their own campus classes. At some future time, they will be better able to spend time planning for E-campus courses. Although there is a global demand for knowledge, much basic support is needed. The change in the international climate requires more E-campus participation to keep programs viable.

In response to concerns about the ♦home grown♦ faculty, Tesch argued that OSU has the best-qualified applicants in an area in which applicants are scarce. However, outside experience is invaluable.

The review report was unanimously approved as written.

3. Category I Proposal to Rename the Department of Apparel, Interiors, Housing and Merchandising (AIHM) the Department of Design and Human Environment (DHE)

Cheryl Jordan, chair of the Department of Apparel, Interiors, Housing and Merchandising (AIHM), presented a proposed to change the department's name and to rename its MA, MS, and PhD degrees. The new department name and the name of the degrees will become ♦Design and Human Environment.♦ As background, she noted that all the degree programs in the department are focused on enhancing the human environment. The new name will relate better to the mission of College of Health and Human Sciences and better describe the department's mission within the college, which was recently renamed. The college has decided that all programs should reflect the increased emphasis on integrating work across departmental lines. The department's new name reflects what it does, with

all work integrated around the human environment. These are interdisciplinary programs at work, with emphasis on seeking ways to address issues such as the needs of an aging population within the content of its programs.

In response to questions about the impact on graduate students, especially how this affects the students' job placement, Jordan explained that graduate programs are built around specific areas of interest. The title of the department is not as significant as the emphasis that is placed on the combination of courses taken. Three professional associations are most closely related to the department's primary interests: International Textile and Apparel Association, Interior Design Education Council, and Housing Education. None of these will have concerns about the name change. Michigan State University has a similar name (i.e., Human Ecology College, Department of Human Environment and Design). Students were not consulted regarding name change decision. Current graduate students, who were not consulted about the name change, can graduate with DHE degrees or they can continue to study and graduate with AIHM degrees.

Due to an oversight, the proposal had bypassed the Graduate Council and had gone to the Faculty Senate without gaining Graduate Council approval. After this mistake was discovered, the proposal was sent to the Graduate Council because the graduate degree name would also be changed. The new name is a better reflection of the integrated programs of study.

The proposal to change the name of the department and the name of the graduate degrees was approved unanimously.

4. AIHM Follow-up Report

Paul Cull (Engineering) shared a follow-up review of the graduate programs in the Department of Apparel, Interiors, Housing, and Merchandising. That report appears here. A draft of department accomplishments that had been submitted to Cull and Ciuffetti prior to their conversations appears as Appendix 2 to these minutes.

AIHM GRADUATE REVIEW FOLLOW-UP

Following Graduate Council procedures, we held a meeting to see what progress had been made in following the recommendations of and addressing the areas of concern in the review of the graduate programs in the Department of Apparel, Interiors, Housing, and Merchandising.

Paul Cull and Lynda Ciuffetti represented the Council and Cheryl Jordan and Elaine Pedersen represented the Department.

The discussion was structured around the review report's recommendations and the department's responses. A copy of the responses is attached.

Overall, the department has made positive responses to the recommendations in spite of budgetary constraints and administrative uncertainties, and the faculty should be praised for their efforts.

Here we will briefly review some of the issues and actions:

1. Slash Courses (4xx/5xx)

This is still a university issue and we hope for a resolution through the appropriate committees and councils. The AIHM department has a sufficient number of stand-alone graduate courses to support its graduate degree programs. The slash courses will be changed to 400-level if 400-level courses are permitted on graduate programs.

2. Fellowships

The department is working with the OSU Foundation offices for the new College of Health and Human Services to establish funding for graduate fellowships. Given the university's priorities, it is unlikely that much progress will be made toward funding fellowships.

3. Diversity

The department has been successful in recruiting some minority students and in increasing international contacts. No male students have completed a graduate program. More effort is needed to address this gender imbalance.

4. Grant Participation

In many departments, graduate students are expected to be participants in grant supported

research. With their large and increasing demand for undergraduate work, AIHM has little time for producing grant proposals. Students are now writing proposals in 600 level courses. The department is also participating in the college's Gerontology program. Grants and grant participation is likely to continue at a fairly low level.

5. Web Site

The department and college web sites have been improved. The department graduate student handbook should now be on-line.

6. Travel Funds

Some college funds have been available for student travel to meetings. The present budget does not permit department funds for student travel.

7. Faculty Retreat

Retreats both for the new college and for the department were held. These retreats resulted in the Department becoming more focused. They have also been given permission to search for two candidates for faculty positions left open by retirements.

8. Professional Master's

A professional project is now being offered as an option for the master's degree. An internship or professional experience is also required.

9. Student Space

Additional space for graduate students has been found. In addition, the building has been rewired and computers with web access are available in all offices.

10. Laboratories

The specific air conditioning problem has been fixed. A Behavioral Science Lab has been set up. By using donations and student fees, the hardware and software have been updated.

11. Teaching Loads

There have been no real reductions in teaching loads. Every graduate faculty member has a chance to teach a graduate course. There are a large number of fixed-term faculty to deal with the increase in the size of the undergraduate program.

12. Advisory Committee

The department has one advisory committee for both graduate and undergraduate programs. The college is also developing an Advisory Board.

13. Increased FTE

A minor increase in fixed term FTE was given to the department to help with the increase in undergraduates. No FTE was given for graduate work or for the significant amount of committee work done by the faculty.

14. Interdisciplinary Work

The new college is supporting cross-department research work and will be offering college-wide graduate courses, which can be used by several departments.

Conclusions:

The AIHM graduate program is a small program. For many reasons, including the department's commitments to its undergraduate programs, this is unlikely to change. The faculty is devoted and hard-working. They prepared an exemplary review document and they have responded to all of the issues raised in the review team's report. The faculty should be applauded for their efforts. No further recommendations are needed at this time.

Council members asked whether the graduate program is truly viable with only 16 graduate students. The program was approved as a small program. With only eight faculty members, it is expected to remain a small program. The department does hope to hire a new faculty member with a PhD to increase the department's ability to offer more graduate classes. The money received from industry will help to offset the small number of grants. However, lack of funding to support the program does contribute to the small number of graduate applicants.

The follow-up report was accepted unanimously.

5. TOEFL Alternatives (continued)

In response to a question from Council members, Deborah Healey, the director of the English Language Institute provided additional written information on alternatives to the Test of English as a Foreign Language (TOEFL) of all foreign applicants (Appendix 3). Because several alternatives are available for foreign undergraduate applicants, the Council was interested in reviewing these alternatives. At a previous meeting, the Graduate Council had approved adding the International English Language Testing System (IELTS) as an alternative to the TOEFL. That decision was confirmed, but based on the new information prepared by Healey, the Council chose not to add any new alternatives. Although high

scores on the verbal of the GRE probably suggest a good grasp of some language skills, the Council has no idea what minimum score would be appropriate. Also the GRE does not currently include testing of important oral communication skills at this time. The Council decided not to take any further action at this time.

6. Other Business/Announcements

The Council discussed the issue of slash courses and whether any additional actions should be taken at this time, specifically permitting the use of upper division undergraduate credits on programs of study. This issue will be addressed at the next meeting of the Graduate Council (December 11, 2003). Tony Collins (Pharmacy) asked about the relationships between 700-level courses required in the Pharm D program and the PhD programs in Pharmacy. This issue was referred to a later meeting.

John Selker (Agricultural Sciences) raised the matter of the manner in which information is communicated to Council members. He said that the Curriculum Council uses the Blackboard software instead of sending information via e-mail and asked whether the Graduate Council should do the same. Selker was asked to explore the use of the software further and make a recommendation to the Council after working with it more. Lynda Ciuffetti agreed to share this suggestion with Bruce Rettig, Associate Dean of the Graduate School. Further discussion will be needed.

Appendix 1 Graduate Council's Program Review of the Graduate Program Department of Forest Engineering College of Forestry

Program Review

Committee Process

The Department of Forest Engineering underwent a Graduate Council Program Review April 14, 2003. Members of the Graduate Council Review Committee were:

Barbara Watrous, Committee Chair (Professor, Dept. of Large Animal Clinical Sciences)
Janet Lee, PhD (Professor, Women's Studies Program)
Robert J. McGorin, PhD (Dept. Head and Jacobs-Root Professor, Department of Food Science and Technology)
Kenneth J. Williamson, PhD (Dept. Head, Civil, Construction and Environmental Engineering, Department Head, Chemical Engineering)
Bruce Hartsough, PhD, external reviewer from the CSREES team (Professor and Chair, Dept. of Biological and Agricultural Engineering, UC-Davis)

As part of the review process, a self-study report was prepared for the Program Review Committee. The report was delivered to the committee members two weeks prior to the review. The internal members of the committee met with Dr. Sally Francis, Dean and Dr. Bruce Rettig, Associate Dean of the Graduate School. The self-study report, relevant to graduate education, was a compilation of data covering faculty participation in college and departmental committees, graduate student enrollment and degrees conferred by year, faculty FTE allocations including teaching assignments, current graduate student entrance credentials and funding, department course reaction survey results, funding sources, theses and professional papers by recent graduate students, inventory of classrooms, offices and laboratories, Graduate School student surveys, Forest Engineering graduate placement, Graduate GPA and GRE data, and the recently revised Graduate Student Handbook. Formal presentations were part of the review format, during which the Graduate Advisory chair discussed their committee duties and presented data regarding recruitment, applications, selection process, accessions, funding, advising, course work, annual student performance reviews and graduate participation in teaching.

This review was concurrent with a departmental review by the Cooperative States Research, Education, and Extension Service (CSREES). Members of the CSREES team were:

Daniel L. Schmoldt, PhD, Team Leader (National Program Leader, USDA/CSREES/PAS)
Richard W. Brinker, PhD (Professor and Dean, School of Forestry and Wildlife Sciences, Auburn University)
David R. DeWalle, PhD (Professor, Forest Hydrology, Assistant Director for Graduate Studies and Research, The Pennsylvania State University)
Bruce Hartsough, PhD, external reviewer (Professor and Chair, Dept. of Biological and Agricultural

Engineering, UC-Davis)

Kenneth J. Williamson, PhD, joint committee appointee (Dept. Head, Civil, Construction and Environmental Engineering, Intrim Department Head, Chemical Engineering)

The Graduate Council committee, the CSREES team members, and the Department Head met the night before the start of the review and got organized. During the review, our team met with the Dean of the College of Forestry, the graduate and extension faculties, staff and graduate students of the Department of Forest Engineering. A tour of the facilities in Peavy and Richardson Halls was conducted by Dean Emeritus George Brown and Department Head Steve Tesch.

Both review teams had a joint executive session following the review. On April 16, the CSREES team presented their exit report to the Dean Hal Salwasser and the College of Forestry administrators, the departmental faculty, staff and graduate students and to the University administrators. Dr. Bruce Hartsough then provided his analysis and recommendations which are incorporated in this review report.

Background of the Department of Forest Engineering

An historic overview of the College of Forestry and the Department of Forest Engineering is provided in the self-study report. A focus on graduate education evolved when a research program was added in 1968. Hydrology was added to the department in 1971 when the Forest Practices Act was passed in Oregon. Extension specialists were included in the faculty in 1972. The last graduate review was conducted in 1989.

GRADUATE TEACHING AND ADVISING

There are three graduate majors in forest engineering: a Master of Forestry (MF), Master of Science (MS), and Doctor of Philosophy (PhD) degrees. The Master of Forestry Degree program has emphasis in Forest Operations, Forest Engineering, Forest Hydrology and a proposed option in Forest Soil Science. It is designed for students who want a year or more of formal graduate work. Post graduate vocations include management, administration or staff positions with private or public forestry organizations. A professional paper rather than thesis is required. The Program Committee is comprised of the major professor and at least two other faculty members.

The Master of Science Degree program has emphasis in the same four areas of concentration, but is designed for students who wish to develop a research specialization with the intent of pursuing a research and/or teaching career. A major or a major and minor fields of study may be pursued. There is a requirement of an independent research project to be reported in a formal thesis and at least 2/3 of the credits must be in a major field of study. The Program Committee is comprised of the major professor, at least two other Graduate Faculty members, one of which is from outside of COF, and the Graduate School representative.

The Doctor of Philosophy Degree program is designed for persons wanting careers in teaching, research or technical leadership with land management enterprises. Doctoral concentrations are Harvesting, Harvesting and Silviculture, Forest Hydrology, and Forest Soil Science (proposed).

The faculty and students clearly differentiate between the Forest Operations (harvesting) and Forest Hydrology areas. Although there are also areas of concentration in forest engineering and forest soils (proposed), the former two are the primary areas of pursuit. Few graduate students view themselves strictly as forest engineers; in fact, many hydrology students are unfamiliar with forest engineering when they enter the program. **To continue to attract a broad scope of applicants, at some time in the near future, expansion of the departmental title to include hydrology, watershed and/or natural resources engineering might be appropriate.**

All professorial and instructor level faculty serve on the Graduate Faculty as major professors and/or committee members for graduate students both within and outside the Department of FE. Currently, seven of the sixteen departmental faculty serve as major professors, and fifteen of the twenty graduate students are assigned to only four major professors. One (Glen Murphy) has one MS student, one (Stephen Schoenholtz) has two MS students, one (John Sessions) has two PhD students, one (Jeffrey McDonnell) has three PhD students, one (John Garland) has two MF and two MS students, and one (Loren Kellogg) has one MF and two PhD students. Graduate students are accepted into the program only if a major professor is identified to ensure the student arrives to campus with commitment of a major professor to guide their program. Flexibility reportedly exists for students to switch to a different major professor, but another major professor must agree to serve. The process of changing major professors, according to a few students, may not be an easy task. In addition, more than two terms may pass before the Graduate Advisory Committee members are identified. By this time, sufficient course work may have been completed which might not be considered

appropriate by the Graduate Advisory Committee for the final course of study, resulting in lost time and energies and increased financial commitment by the student. **It is recommended that a more timely process of Graduate Advisory Committee member identification be made to expedite the development of a course of curriculum.** And because a match between a major professor and graduate student may not prove to be workable, **policies and procedures for addressing change of a major professor should be made known and facilitated.**

An annual performance review is conducted each spring by the major professor, appraising work performance if the student is a GRA and to discuss future plans. Completion of the review is required before financial aid or payroll is processed for the next fiscal year. Also according to the self-study document, the Department Head conducts an exit interview with the student in order to obtain feedback on her/his experience and help identify ways to further improve the graduate programs.

Allocation of FTE to teaching varies considerably among the faculty from 0.025 to 0.73 (Brian Kramer, retiring this year with a 1.00 teaching FTE, is being replaced by Dr. Kevin Boston with an assigned 0.20 FTE in teaching). FTE allocation also varies with regard to credit hours (i.e., extreme examples are one individual with eleven credit hours plus one two-member team taught two-credit course is 0.50 FTE teaching and one individual with eight credit hours is 0.15 FTE teaching. Roughly 30 total graduate and undergraduate courses are taught per year. Two faculty teach four and one teaches seven or eight courses per year. Given the low graduate enrollments in most courses, the graduate teaching loads appear to be low. With regard to students who completed their undergraduate degrees in FE at OSU, the 4xx/5xx courses are problematic; essentially, these students repeat the same courses with some additional material. **It would be advisable to have graduate students include some upper division, stand-alone courses in their programs of study. The alternative would be to eliminate some of the 4xx/5xx options.**

All areas of concentration offer a high degree of flexibility on paper, although students indicate that the actual interpretation of the requirements versus recommendations varies among major professors. Hydrology students have good information on the courses available across campus, while operations students noted that some department faculty are less familiar with offerings in other departments. In many cases, the courses listed in the catalogue are cancelled or not offered a given term, forcing the students to revise their programs of study, multiple times in some cases. **It is recommended that some effort be made by the department to monitor course offerings to assist graduate students in course planning so that a minimum of program revision is required.**

In general, graduate course evaluations are favorable. Many of the faculty have been recognized in the past for their excellence in teaching and advising (Dr. John Sessions with the OSU Distinguished Professor and the OSU Top Prof awards and the College Aufderheide Award for Excellence in Teaching; Dr. Kevin Boston with the Lecturer of the Year award from University of Canterbury, School of Forestry; Dr. John Garland with the E.R. Jackman Excellence in Extension Education award; Dr. James Kiser with the Aufderheide Award for Excellence in Teaching and the Xi Sigma Pi Excellence in Mentoring Award; Dr. Steve Tesch with the Aufderheide Award for Excellence in Teaching; Dr. Brian Kramer (retiring) with the Julie Cleaver Student Mentor Award; and Dr. Marvin Pyles received the College of Forestry Dean Award for Outstanding Service in Advising..)

Responses from 14 current Forest Engineering Graduate Students to an OSU Graduate School survey in preparation for this review revealed strong agreement in departmental support on respect to equipment, access to other OSU facilities, notification of upcoming examinations, appropriate transfer of information whether by individual mailbox or other means of communication, involvement in thesis-based research, providing for specific and potentially unique needs of international students, and assignment of graduate research assistantships. However, dissatisfaction in several areas were identified. Two graduate students disagreed that the department offers adequate diversity of graduate courses sufficient for timely completion of a full graduate program. Two students felt that departmental seminars are not adequate to keep them informed of developments in their field. Two responded they did not have adequate access to their major professor. Three students disagreed that they were receiving the research and professional development guidance they need. Three were unhappy with the interpersonal interaction with their major professor. Four students disagreed that the graduate courses in the department are taught at an appropriate graduate level and are of sufficient rigor. And, seven did not feel the initial advising they received when they entered the graduate program was an adequate orientation.

Given the other opportunities to take related courses in other departments at OSU, the range of graduate-level course offerings in forest hydrology (five regular courses plus special topics) is satisfactory. Determining the number of stand-alone graduate-level course offerings in forest operations is more difficult because listings differ between the self-study report and the Departmental web site listing but appears to about three. Over the last three years, enrollments in the hydrology courses have ranged from 5 - 12 students, so most

courses are offered as graduate-only. In contrast, there are at least twelve 4xx/5xx slash courses offered in the department of FE and most of these are for forest operations. With only seven of the 20 graduate students following this emphasis, frequently one, two or three graduate students are enrolled in a slash course dominated by undergraduate students. The problem with sufficient rigor in their programs may stem from the number of slash courses their programs contain.

A formal Graduate Committee was invigorated last year with the appointment of Stephen Schoenholtz. The process of admissions, assignment to major professors and orientation appears excellent. An issue that needs addressing either by this committee or by the major professor and the student's committee is **improved initial advising early in the program to assist students in preparing their programs of study. This would include a standard for course requirements for each area of pursuit.** There was expressed concern by some of the MF students that the written description of the Master of Forestry program in the Graduate Student Handbook is not being followed by the faculty. Several graduate students showed dissatisfaction with communication concerning degree requirements, although most appreciated the flexibility of being able to create their own programs. In practice, the level of rigor required for the MF degree is similar to that for the MS program. Some students are apparently urged to pursue MF degrees as the most appropriate for their work, but held to MS standards. On paper, the MF is less rigorous program than the MS, but the average time to degree is longer for the MF (more than three years) than for the MS (slightly less than three years). The MF students would like the MF criteria as written to be followed. **It is recommended that requirements and expectations as described in the Graduate Student Handbook be followed or if requirements have changed that they be formalized and better communicated to applicants and incoming students. Alternatively, eliminate the MF option or convert it to a course work-only option, allowing self-funded students to complete their programs in as little as one year.**

Initial advising and orientation need to be formalized and extended. Many students come into the program with little or no background in forestry or forest engineering. There was a general interest expressed in **a college-level orientation that would allow all incoming students to gain some understanding of forestry and the various activities within the college.**

FACULTY AND RESEARCH PROGRAMS

The Forest Engineering Department currently has about 30 professional staff. There are 16 salaried faculty members; 14 are located on the Corvallis campus, and two are stationed at county Extension offices. FTE allocations are 2.6 (teaching), 6.75 (research) and 3.8 (extension). Additional FTEs involve advising, continuing education, department support and administration, and the logging program management. Other affiliate faculty include three adjunct and three courtesy faculty and one part-time instructor.

Despite the long term difficult state financial situation and educational budget cuts in the 1990's and early 21st century, the number of faculty positions has remained static since 1989 with the exception of the addition of the Richardson endowed chair. The Stewart Endowed Professor was created for an existing position. There are presently no unfilled tenure-track vacancies. This suggests that the Department successfully obtains support from the College in filling open faculty positions as retirements and openings occur.

Faculty diversity encompasses numerous factors. The review teams specifically considered intellectual and academic breadth and gender and ethnic makeup. Expansion of the Forest Engineering programs beyond forest operations into water resources and hydrology and the proposed forest soil science disciplines significantly expand the breadth. Although the College of Forestry has several female faculty, the faculty composition of Forest Engineering is presently entirely Caucasian and male. Faculty diversity in broad forestry programs is problematic, as the number of minority doctoral graduates from all natural resource programs is small. Minority graduate students from international locations usually return to their country of origin. If female and minority faculty members were currently on the faculty, they could enhance recruitment and mentoring. The department has proposed to educate minority graduates to expand gender/ethnic diversity. This unfortunately would in turn limit intellectual and academic breadth.

Eleven of 16 Forest Engineering faculty have earned their degree from Oregon State University. Faculty who have received a PhD at OSU have had educational exposure at other institutions, as well as work experience in industry, agencies or other academic institutions. The broad exposure would enhance ability to lead graduate study, however, there is the possibility of a narrow intellectual scope when the formative training is similar among the majority of the faculty.

Success and Vigor of Research Programs

The Forest Operations and Forest Hydrology research programs are widely recognized for their quality in their research and curricular output. There are a number of indicators that the Department is achieving well, despite the serious budget challenges of the past decade.

- The Department has been able to attract research grants totaling nearly \$4.1 million over the past six years. Annual funds from extramural grants and contracts (including returned overhead) have ranged from \$500,000 to more than \$1 million, and have averaged about \$700,000 per year over the last five years.
- Several faculty have been presented awards which recognize their outstanding research contributions. One has received numerous international honors in hydrology, another received a national leadership award, and one is a university distinguished professor. Several others were recognized at the state and regional levels.
- Interviews with graduate students during the review confirmed that the Department has an excellent reputation, is externally perceived highly, and is recommended by faculty from other universities.
- The frequent faculty involvement in both domestic and international forest issues adds enrichment to student learning.

At the same time, several areas and opportunities were recognized to increase research funding:

- A goal of OSU 2007 is to increase research funding by 50%. This may be accomplished by competing for large-scale research grants from federal agencies. Expanding hydrology and agricultural research endeavors beyond the forests and into agricultural and urban land use arenas would enhance the research program.
- Based on assessment by the CSREES team, the predominantly industry support research may limit the breadth of research projects and does not teach graduate students the rigors sometimes required to be successful in competition grant acquisition. A much greater emphasis on competitive grant funding is needed. Collaborations should be encouraged within and outside of OSU.
- Some faculty with high research FTE should strive to increase acquisition of research dollars.

The Department has graduated an average of 1 Ph.D. student per year over the past five years, . The numbers of Ph.D. students entering the program have increased steadily from three per year to the present nine per year over the same 5-year period. This figure includes students not enrolled at review time. The job market has been excellent for PhDs in FE, FO and FH. Demand particularly in academia has exceeded the availability of new PhDs. The bulk of the Department's graduate students obtain M.S. or M.F. degrees, averaging four per year combined. Recognizing that the research activities conducted by graduate students serve as the foundation of the Department's research program, it needs to attract additional M.S. and Ph.D. students to maintain and strengthen its program. Current resource levels in the Forest Engineering Department could support an additional five to six graduate students per year. The Department does not appear to be limited by the number of suitable domestic and international graduate students that it can attract. The FE program in water resources and hydrology is highly successful in attracting a larger pool of graduate students.

Productivity

Over the period from 1997 to present, the scholarly output has increased from 1.1 annual refereed publications per research faculty to 1.8 in 2002. If viewed solely on a research FTE basis, the currently number is 3.7 per FTE. The numbers of peer-reviewed publications per faculty member are very unevenly distributed among faculty. The recent influx of junior faculty should contribute to an increase in scholarly output in coming years.

GRADUATE STUDENTS

The graduate mission of the Department of Forest Engineering is to offer a challenging, contemporary education program that serves as a foundation for a dynamic research agenda. The department offers Masters of Forestry (MF) and Masters of Science (MS) degrees with concentrations in forest engineering, forest hydrology, forest operations, and forest soil science (latter proposed) and a Ph.D. with concentration in harvesting, forest hydrology and forest soils, in addition to a Ph.D. in harvesting and silviculture offered jointly with the Forest Science Department. There is concurrently a proposal for a new interdisciplinary degree program in Water Resources Engineering. The Category I proposal is in progress with leadership from the Center of Water and Environmental Sustainability.

The data provided for review were spotty, inconsistent and generally did not provide a clear picture. Information on applicants for only one year was provided with no information on numbers of admissions. The

data suggested the numbers of students receiving degrees over 14 years exceeded the number of new enrollees over the same period. Residence times based on annual enrollments and numbers of degrees granted did not match reported times to degrees. The lack of data and discrepancies may in part be related to problems with the Banner information system, changes in office staff, and lack of record keeping that may well be due to limited resources. The new Continuous Enrollment Policy may also improve record keeping.

Students are recruited for the graduate programs in Forest Engineering through professional networking and the role of students as "ambassadors" for the program. Faculty research publications, conferences and other professional meetings are important sites for recruitment, as also is the print and electronic publicity generated by the department. With low numbers of Forest Operations applicants (seven to eight compared with twenty-four to twenty-five Forest Hydrology applicants for a similar number of positions) to fill about four enrollments, selectivity is low. Some faculty members actively recruit specific individuals which is an excellent approach with a small pool of candidates. **It is suggested that the department web site be a strong focus for attention concerning future recruitment with attention to maintaining current departmental information.** The forest operations group needs to increase their visibility to increase numbers of applicants and the quality of enrollees. The decline in other forest engineering programs throughout the US should offer a bigger geographic region for recruiting. But, decline in available programs likely has occurred because demand for forest engineers in the US has dropped and forestry relative to resource extraction has gained a negative perception in the mind of the general public, especially the urban sector.

Currently, 20 students are enrolled for the various graduate degrees with differing levels of completion of their programs. Approximately one third (six students) are female and there are not students of color representative of domestic U.S. racial and ethnic groups. The department has been able to attract a small number of male overseas students of color. **Given the department's diversity mission as discussed in the self-study report, it is suggested that attention and resources be given to increasing the diversity of the student body through the hiring of more diverse faculty, personal recruiting of diverse graduate students, and participation in specific organizations and professional bodies to encourage women and minorities in science (for example, AWIS). Recommendations also include suggestions that the department participates in electronic conferences on minorities in science and engineering [Princeton's web site list these], carefully reviews the NSF recommendations in their recent report, *Women, Minorities and Persons with Disabilities*, communicate with the University of Maryland's A. James Clark School of Engineering's Center for Minorities in Science and Engineering, and subscribe to the *Journal of Women and Minorities in Science and Engineering*.** Diverse students will only attend an institution that welcomes and supports them personally and socially. Although women students said that they are for the most part happy with their program, several explained the difficulties associated with being a woman in a male-dominated department and the associated problems of climate and lack of female mentors. This information was revealed to one reviewer in a non-public setting in response to the following question: "What's it like being a woman in this all-male department? **It is suggested that greater attention be paid to gender issues (faculty might look to the Affirmative Action office or other resources on campus for help with this) and that formal mentoring for women students with women faculty in other associated departments be explored. Given that these faculty are often overburdened with their own students and university service, perhaps opportunities for remuneration for such a mentoring program can be explored. Finally, the department might encourage electronic mentoring networks for women students. One e-mentoring network for women in science and engineering is www.MentorNet.net.**

While enrollment in the Department of Forest Engineering is relatively stable, it has declined by about 25% since the last departmental review in 1989. For the most part, graduate students' interest is split between forest operations and hydrology, with the latter becoming an increasingly more popular choice. This year the department received 32 applications with about one third selecting forest operations and approximately 20 in hydrology. Generally, women are more likely to choose hydrology over the traditional logging and harvesting focus of forest operations. This trend has important implications for the future of the department. Equally important is the issue of sustainability in the face of declining enrollment. The new interdisciplinary degree in Water Resources Engineering might attract new and more diverse students, although it might also siphon off interest from existing programs. **Some suggestions for addressing the issue of graduate program sustainability include improving recruiting techniques for faculty and students (especially focusing on personal recruiting through proactive identification of prospective students and perhaps targeting overseas students) and developing increased and more varied research and funding opportunities. Since departmental faculty are all male and all-white, conscious effort must be made to initiate contacts with diverse faculty in other programs. While relying on existing faculty networks might increase enrollment, it will most likely only replicate the department and not diversify it. It is also suggested that the department keep statistics on the number of women and students of color who apply and are not accepted or funded and the reasons for these decisions.**

Students reported that they were attracted to the department for several reasons: its prestige and the high quality of faculty as well as the generous levels of funding students received. **Clearly funding is important for the recruitment and retention of students and these levels of funding must be maintained.** While there is mixed opinion among faculty concerning whether students would be accepted without funding, all currently active students are funded through scholarships or grants. **The department is commended and encouraged to continue forwarding students for the competitive college fellowships.** Since all students need a faculty member willing to work with them, **the Graduate Council committee encourages departmental faculty to be willing to work with students with perhaps more diverse interests in order to increase enrollment and diversify the department.** There are currently no funding sources for students who are interested in teaching. While it is expected that Ph.D. students receive some teaching experience and many Masters level students do occasional teaching as part of their GRA responsibilities, there is no formal (and thus no representation from the Graduate Student Union) opportunity for teaching. A considerable number of students said they would like this experience. **It is suggested that the department consider formalizing their doctoral requirements concerning teaching and provide opportunities through GTA positions.** While it is understood that part of the problem here is the lack of **appropriate undergraduate courses appropriate for graduate student teachers, perhaps the department could encourage graduate student facilitation of discussion groups and labs and consider creating graduate student-taught lower division courses that would attract students from other colleges and fulfill baccalaureate core categories in the area of physical sciences.**

The quality of students is good with average GPA scores of 3.45 and very good GRE scores in qualitative and analytical, although lower scores on verbal items. Students come from diverse education backgrounds and regions. Graduation statistics are stable although somewhat low, exacerbated by the fact that Masters level students in particular receive attractive offers from business before finishing their degrees. **Continued attractive funding discourages students seeking employment as might the new graduate school policy of continual enrollment. In addition, the department should be encouraged to formalize time limitations associated with student funding support to encourage student completion of the program in a timely manner.** Students are readily employable and seem to have good success in the job market or in advanced degree programs. The department does not seem to have clear data on retention and dropout rates. **It is suggested that these data be kept and that statistics on time to completion of program, retention and dropout by gender and race also be kept to help meet the department's diversity goals.**

Dialogue with graduate students similar items that received lower scores on the Graduate Student Survey indicate that students do not seem to be aware of departmental grievance procedures and the Survey reported a "neutral" response to the item concerning graduate program policies, petition and appeals, as well as the item about changing major professor. There was some discussion about lack of formal mechanisms for advising and support of students who were having conflicts with a major professor. **Recommendations include clarifying these policies and better communicating them to students.** Graduate students explained that the quality of the program really depended upon their relationship with their major professor. The Graduate Council committee notes the inevitability of such a situation in research-oriented graduate departments yet **encourages the department to pursue ways to provide support and opportunities for students outside this relationship.**

Data for graduates over the past ten years clearly indicate that most students gain employment in relevant areas. Two-thirds of the doctoral graduates have gone into academia and a fifth into government agencies. Despite apparent differences in Masters tracts, there is little differentiation in employment between MF and MS students. Only 10 percent (4 MS and 1 MF) have gone directly into industry firms. No doctoral graduates have gone to industry. The audience for OSU graduate students is not in the forest industry.

FACILITIES

The facilities available to the Department of Forest Engineering are, in general, excellent and fully support the program. The classrooms, laboratories, and offices are relatively new, fully maintained, and conducive to teaching and scholarship. The IT support was identified as excellent for faculty, staff, and students. The computers were of high quality and adequate quantity to provide the IT services for the high use by the Department's graduate program. Various equipment needs in the Department appear to be within the possibility of funding by the College or alumni donations.

One area of need is a water quality laboratory to support the hydrology program. This appeared to be more related to instrumentation than space. The hydrology program is rapidly growing and the investment for the facility could come from directed COF investments, an NSF equipment grant, or a targeted alumni donation, all highly probable sources.

The 14,500 acres in the McDonald-Dunn forests provide an invaluable resource to aid the educational and research needs of the Department's graduate program. These lands provide both hands-on experiences for both the forest operations and hydrology programs, and give ready access to research plots for a variety of experiments. The Department seems to be using these facilities fully in support of their graduate programs.

The support staff that maintains the facilities are numerous and highly professional. The graduate students noted the excellent services that they receive from the staff for both their educational and research needs.

ADMINISTRATION

The administration of Forest Engineering appears to be excellent, and includes active participation by Departmental and College administrators, departmental staff, and faculty. The FE Department administration is lead by the department head, an office manager and one support staff person. The college administrative support is extensive relative to other college at OSU and includes Student Services, Business Office, Forestry Media Center, Outreach Education Office, Computing Support Group, Forestry Communications Group, and editing staff. Faculty are involved through a committee structure that includes Undergraduate Curriculum and Advising, Graduate, and the Promotion and Tenure Committees.

The faculty and graduate students feel supported by the administration and have high regard for Steve Tesch's leadership as Department Head.

Appendix 2

4/17/03

FOLLOW-UP REVIEW OF GRADUATE PROGRAM IN APPAREL, INTERIORS, HOUSING & MERCHANDISING

REVIEW RECOMMENDATIONS and *DEPARTMENT RESPONSES*

SPRING 2003

- The Committee endorses the Department=s interest in working closely with representatives from the OSU Foundation to leverage industry to contribute to AIHM graduate fellowships, perhaps even in the form of endowed fellowships.

Development effort for funding of graduate fellowships is a top priority within the new College of Health and Human Sciences. The Department will continue to work with the new Foundation officer for the College to seek further opportunities for graduate fellowship funding.

- The Committee recommends that the Department continue their efforts to recruit minority students into the program and expand its currently informal international exchange program, as that is likely to contribute cultural richness to the program beneficial to both students and faculty.

The Department was successful in attracting one Hispanic student and one McNair Scholar both of whom will begin their graduate programs Fall 2003. Although the Department has continued efforts to recruit U.S. minority students, it has not yet launched additional efforts to do so. Currently, 20% of the Department=s graduate students are international. The total number of applications for program entry during the 2003-04 academic increased over 108% compared to last year, 68% of these applicants were international students and 8% were U.S. minority students. The Department has continued but has not expanded the number of visiting scholars due to the soaring undergraduate enrollment and increased demands upon the Department faculty. For the 2002-03 academic year, the Department hosted one international visiting scholar and one international courtesy faculty member, both from Korea. One AIHM faculty member has accepted the invitation to conduct a program review and research seminar in Seoul, Korea in June 2003.

- The faculty may want to consider the request that graduate students had regarding meeting separately with the professor to review research articles, discuss current issues related to the topic, or to have the opportunity to assist the professors in grant writing, as a way of meeting the graduate requirement in slash courses.

The AIHM Graduate Committee has very recently begun meeting to discuss this issue to prepare a

proposal for the full faculty. Because of the uncertainty of decisions that were to be taken by the Graduate Council concerning the issue of the 400/500 level courses this discussion was postponed until very recently.

- The Committee recommends that the College provide the resources and staffing necessary to update AIHM=s web siteBperhaps even offering a GA position to a graduate student who has these skills. The program=s website needs to be updated in order to sustain outreach to prospective graduate students.

The new College has allocated resources for a part-time webmistress and a Director of Marketing and External Relations. A new web site for the College and each Department unit was launched Spring 2002. The graduate portion of the AIHM website was updated and expanded Summer 2002 with plans to make the entire Department Graduate Handbook available online by Summer 2003. Additional updating of the College and Department web site is set for September 2003.

- The Committee also recommends that, if at all possible, the Department set aside a travel budget for students whose work has been accepted for presentation at national conferences. This is a valuable part of their professional development, and student=s attendance at national meetings will increase the visibility of the program.

College development funds were used to support two AIHM graduate students' attendance and research presentations in 2001-02. Although the Department concurs with the recommendation, the current budget situation has not made it possible to support graduate student travel this academic year.

- The faculty should be encouraged to conduct a retreat away from the campus environment to think about future developments and programmatic connections, internally and externally. Some resources could be offered from the administration to make this possible, and the pay-off is sure to be extensive, given the people involved. Representative members of other departments who are likely to become part of the new college could participate in some or all of the retreat, to facilitate the exploration of new possibilities. A department retreat was held Fall 2002 to discuss the new Dean=s vision for the College and the Department=s potential contributions to that vision. The Department Chair is in conversation with the Dean concerning plans for a department retreat to be scheduled for either Spring or early Fall 2003. Objectives for this future retreat are to develop future programmatic focus or foci for scholarship and external funding, the graduate program and criteria for new faculty hires.
- AIHM should explore the idea of a professional Master=s degree. The faculty has this interest and initiative, and with some administrative support and encouragement, there are outstanding possibilities to build on the already excellent relationship with the various professional worlds AIHM addresses. A professional Master=s programBincorporating coursework and a capstone experienceBwould also allow the critical mass of graduate students in existing courses to grow, would enhance development and outreach opportunities and world address critical professional needs of Oregon residents, as well as, potentially, distance learners.

The professional project option will take the place of the current creative accomplishment. Students will still share a core of course work. However, unlike the current creative accomplishment, in the professional project option there will be specific delineated curriculum for each area: apparel design, interior design, housing studies, and merchandising management. Unless the professional program student comes with an extensive professional background, the curriculum requirements will include an internship as a capstone experience.

- The graduate students need more physical and cultural spaces to interact with one another. Having one larger location (i.e. an office or a study lounge) for GTAs and non-GTAs alike to become an integrated cohort group would be a helpful start. Since the number of students is small, we would suggest that all graduate students share the same space. Access to the Web and email are essential for graduate students. Programmatic orientations and practices could also be design to foster more interaction. An updating of the building=s wiring for electronic access would also enhance cohort collegiality.

Rewiring of Milam Hall was completed Summer 2002. This included complete rewiring of the building and the addition of internet access drops in all offices and classroom spaces. The graduate student office for non-GAs now has internet assess, a computer and a printer. One additional office space (MLM 23) was obtained for GRAs. Discussion of space usage within the College resulted in a compromise solution. Beginning Winter 2003, AIHM now shares a multi-use space (MLM 27A) with Family and Community Development Extension. This space is now used as a Behavioral Science Lab and seminar room for small graduate courses. Graduate students can schedule meetings and/or discussion groups in this space.

- Research labs are necessary for a viable graduate program. The textile lab needs to be a constant temperature and humidity room, but on inspection and in discussion it came out that this equipment was not working. One professor is using this lab for externally funded research. For this research to continue, the temperature-humidity equipment must be repaired or replaced.

Repairs were made Fall 2001.

- The teaching loads of the faculty should be addressed. The large size of the undergraduate program reveals the success of the faculty=s educational mission, but the quality may be better sustained by reducing the quantity of the course loads somewhat. For example, consolidating the faculty commitments into five, rather than six, courses per year would allow more time for working directly with graduate students (and would still be a greater teaching load than what exists at comparative institutions). Other possibilities are to restructure and combine some of the lower division classes, deliver some of the courses over the Web, develop some of the lower division courses at the local community college, consolidate teaching loads to two terms for some faculty (three classes per term) to free up one term for research and development.

The Department has made some effort in addressing this problem. Since Fall 2000, the undergraduate program has grown 44% and the graduate program size has remained stable (10-12 students). However, the tremendous increase in graduate applicants for program entry 2003-04, may increase the number of graduate students by 60% (16-18) next year. Total AIHM enrollment Fall 2002 was 462 students (452 undergraduate and 10 graduate students); tenured and tenure-track faculty 7.92 FTE; fixed-term faculty 1.59 FTE. Additional, part-time fixed term faculty (0.89 FTE) were hired for the 2002-03 academic year to help with the increased teaching responsibilities. GTA FTE also has been increased for the past two years. Other efforts to reduce teaching loads include: curriculum revisions to reduce the number of required studio courses in Housing Studies and implementing higher standards for professional program entry in Apparel Design, Housing Studies and Interior Design. However, handling the demand for pre-professional courses remains a problem. The Department requested removal of the Apparel Design major from the Western Undergraduate Exchange (WUE) program Fall 2001 this was granted in Fall 2002. We are currently exploring with the University ways to limit the number of undergraduates admitted to the pre-professional programs.

To reduce teaching loads, the Department also needs to engage in difficult decision-making regarding the number, types (studio vs. lecture) of courses and/or areas of concentration in the curriculum. A College committee of representatives from each department is currently evaluating department graduate research methods and statistics courses to determine potential instructional efficiencies that might be developed to support graduate education across programs within the College.

- Recruitment efforts could become more active and could be enhanced through interactions with the existing advisory committee. This committee might be re-vamped somewhat, in order to address graduate, research and development needs, as well as undergraduate education. Alternatively, a sub-committee could be created to focus on these themes, which are so critical to a professional Master=s program.

With the assistance of the new Communications and Marketing Director hired by the College, the Department developed a new graduate brochure for recruiting purposes. The Department web site has been updated, particularly the graduate education section, with further revisions slated for summer 2003. The Department has not engaged its Advisory Board in discussion of research and graduate education needs. Plans are underway to more actively involve the Board in development efforts.

- It is apparent that AIHM faculty has played, and continues to play, an important role at the campus level in various academic senate and administrative positions. AIHM should be compensated with permanent FTE as well as temporary resources in order to sustain and enhance the program=s excellence. Clearly, the student credit hours merit additional FTE.

Limited additional resources have enabled the Department to hire fixed term faculty for the 2002-03 academic year, however the searches for filling permanent positions (there are two vacant positions, one due to a retirement and one due to a move to a central administration position) have been placed on hold due to budget constraints.

- The program can benefit by leveraging its interdisciplinary nature. For example, the program may encourage faculty collaborations in research and developmental activities with other schools in the campus, such as the business school, the exercise and sport science department and the public health

department, among others.

The Department has begun to engage in conversations with Public Health (PH), particularly the faculty in the Health Care Administration program about potential collaboration in regard to health care design. Conversations are also underway with other units within the new College regarding a new research focus on Healthy Children. AIHM faculty and students are involved in sustainable design initiatives with counterparts in PH and Engineering; others are working with University Housing and Dining services on post-occupancy satisfaction with university housing.

Additionally, the AIHM faculty is in conversation with the Graphic Arts faculty to explore potential collaboration in strengthening design education and research programs on campus. Beginning Spring 2003, the Dean initiated a faculty grantsmanship workshop to provide opportunities for faculty to enhance their skills in obtaining external grants and to develop research ideas that have funding potential. An AIHM faculty member is participating in the workshop this year and others plan to participate in 2003-04. A College-wide research seminar was initiated Fall 2003 to share collaborative research and spawn additional collaborative efforts.

Appendix 3

English Language Testing Information

compiled by Deborah Healey; updated October, 2003

Currently Accepted for Undergraduate Admission at OSU

TOEFL	550 (213 on computer-based test)
Advanced Placement-International English Language	Minimum score of 3
Cambridge GCE "O" levels	Grade of C (pass); no more than 2 years old upon enrollment
Cambridge CAE	Minimum score of C (pass)
English Language Institute, OSU	Completion of level 6 with ELI recommendation
IELTS	Minimum score of 7.0
SAT verbal	500 or above
SAT-II ELP	Minimum score of 965

Skills assessed by each test

	Listening	Speaking	Writing	Reading	Grammar	Vocabulary
TOEFL	x		CBT	x	x	x (in writing)
AP-International English Language	x	x	x	x	x (in writing)	x
Cambridge GCE "O" levels or "A" levels			x	x		
Cambridge CAE	x	x	x	x	x	x
Cambridge CPE	x	x	x	x	x	x
English Language Institute, OSU	x	x	x	x	x	x
GRE verbal			x	x	x	x
IELTS	x	x	x	x	x (in writing)	x (in writing)
MELAB	x	some sites	x	x	x	x
SAT verbal			x	x	x	x

SAT-II ELP	x			x		x (reading/ listening)
Test of Spoken English (TSE) and SPEAK		x				

Explanation of Tests

The **Test of English as a Foreign Language (TOEFL)** is currently offered in two modes: a computer-based test with scores that can be used at any institution, and a paper-based institutional form of the test for use at the institution associated with the testing site only. The ELI administers an institutional TOEFL for its students and others admitted to OSU. The computer-based TOEFL (CBT) includes listening, grammar, and reading components like those on the institutional test, but adds a writing test. The writing assessment is used as part of the grammar subscore on the CBT and is also reported separately. Plans are underway by ETS for a new version of the TOEFL that will include a speaking component. This may be available in 2005.

College Board Advanced Placement International English Language (APIEL) exam. This is a relatively new test and used primarily in Europe, in American schools and international high schools. OSU accepts a 3 on this test. It is a rigorous test, with reading, writing (2 40-minute essays on challenging topics), listening, and speaking components. Speaking is not a component of the current TOEFL. A 4 on this test would show very good mastery of English, and would be more appropriate than a 3 for graduate work. OSU accepts a 3; UO accepts a 3; WOU, a 4. There has been no substantial research at this point comparing TOEFL and APIEL scores, probably because of the very limited use of APIEL. The web page is www.collegeboard.org/ap/students/apiel/.

Cambridge tests: Cambridge University offers the **Certificate in Advanced English (CAE)** as Level 4 of a five-level placement system. A passing score on the CAE fulfills the English language proficiency entrance requirement for most British universities, so could be considered the equivalent of a 550 TOEFL. It is offered through the British Council and in some Canadian schools, but not as widely or as often as the TOEFL. Students who achieve a passing score on the CAE should be able to use that in lieu of a TOEFL to demonstrate English proficiency. Components include reading, writing, English in use (grammar/cloze/vocabulary/reading), listening, and speaking. The website is at http://www.cambridge-efl.org/exam/general/bg_cae.htm

Cambridge University also offers the **Certificate of Proficiency in English (CPE)** as Level 5 of its five-level system. The CPE is used as a criterion for prospective English language teachers, and a passing score on the CPE should be taken as evidence of excellent proficiency in English. Components include reading, writing, English in use (grammar/cloze/vocabulary/reading), listening, and speaking. The website is at http://www.cambridge-efl.org/exam/general/bg_cpe.cfm

The **General Certificate of Education (GCE)** is offered in British school systems around the world as an achievement test and a university placement exam. Achievement of a passing score on **O** or **A** levels means that the person is eligible for university admission in the United Kingdom, much the same way that SAT scores are used in the US. This is a test designed for native speakers and is thus more difficult for international students than the other tests. It is a written exam and may not be appropriate for the full range of skills required in graduate study.

The **GRE verbal** section is designed for native speakers. As such, it is much more difficult for international students than for Americans. The GRE tests the receptive skills of reading, vocabulary, and grammar. Current versions of the test also require writing. It does not test speaking or listening comprehension. This will make it problematic for graduate admissions in departments where there is an emphasis on instruction through lectures.

The **International English Language Testing System (IELTS)** was developed by the University of Cambridge in conjunction with the British Council and IDP Education Australia. It has two tracks: one for academic English and another for **general training**. Both tracks include a composition, reading test, listening test, and oral interview. Inclusion of both the composition and oral interview make it a more powerful tool than the current versions of the TOEFL. For university admission purposes, the academic English test battery would be appropriate. A score of 7 would indicate very good proficiency and readiness for graduate study. More information is at www.ielts.org.

The **Michigan English Language Assessment Battery (MELAB)** is the new version of the Michigan Test of English Language Proficiency (MTELP). It is administered in various sites around the US and Canada only.

Chemeketa in Salem is the only Oregon test site. It includes writing, listening, and a grammar/cloze/vocabulary/reading component in all administrations, with a speaking component at some test sites. An 80 on the MELAB is equivalent to a 560 on the TOEFL, according to University of Michigan research. The MELAB should offer a good assessment of readiness for graduate work, especially with the speaking component. More information is at www.lsa.umich.edu/eli/melab.htm.

The **SAT** is designed for native speakers, and thus more difficult for international students. A score of 500 or better on the verbal portion of the SAT should indicate acceptable English language skills in reading and writing. It does not include listening or speaking, so will be problematic as a measure of readiness for graduate study.

The SAT II ♦s **English Language Placement Test (ELPT)** is now offered by the College Board in conjunction with other SAT II tests. The correlation with TOEFL is quite high, according to research done by the College Board. A score of 950 on the ELPT corresponds to 503 on the TOEFL; 963, to 547; 968, to 558. A score of 965 on the ELPT should correspond to a score of 550 on the TOEFL.

The ELPT is only offered twice per year with the SAT II and only at test centers that are able to offer the listening portion of the test. It measures reading and listening proficiency, both of which are passive skills. Some measure of writing, such as the SAT-II Writing exam, should also be required to balance out this test for students at the graduate level. More information about the ELPT is at www.collegeboard.com.

The **Test of Spoken English (TSE)** and its institutional equivalent, the **SPEAK**, are used to measure oral communication skill. They are designed primarily for prospective graduate teaching assistants. OSU requires all prospective international GTAs to have an oral communication assessment. The ELI administers the SPEAK at the beginning of each term.

Unacceptable Standardized Tests

A few other standardized tests are available, and students may wish to submit their results on these tests in lieu of TOEFL. We feel the following are unacceptable in lieu of an international TOEFL:

The American Language Institute of Georgetown University (ALIGU) test was designed as a placement test for students entering the intensive English program at Georgetown. It has not been substantially updated in over 20 years, so test security is a large issue.

The Michigan Test of English Language Proficiency (MTELP): this test is approximately 30 years old and has not been substantially updated. It should not be a substitute for an international TOEFL due to security concerns.

The First Cambridge Exam (FCE) places students in the third level of the five-level Cambridge exam system. As such, it demonstrates the person's ability to function in a training setting. A passing score would not be adequate to demonstrate adequate English proficiency for university study.

The Test of English for International Communication (TOEIC): this test is designed for business people and others going to English-speaking countries for training sessions. It is not designed to test proficiency in academic English, and thus would not be appropriate for use in lieu of the TOEFL.

The General Training version of the IELTS is, like the TOEIC and FCE, designed for those who do not need an academic level of English. This version of the IELTS would not be appropriate.

Graduate Council

October 23, 2003 Minutes

Present: Ciuffetti (chair), Bond, Collins, Fisk, Francis, Pedersen, Rettig, Selker, Steel, Waldschmidt

Absent: Bermudez

Guests: Brad Cardinal, Deborah Healey

1. Approval of Council Minutes

Because of staffing changes in the Graduate School, the minutes from October 9, 2003 were not available. They will be presented for approval at the November 13, 2003 meeting.

2. Additional Actions on the Mathematics Review Report

At its meeting on May 22, 2003, the Graduate Council accepted the report of a Graduate Council review of the graduate degree programs in Mathematics. During its May discussion, ♦Council members concluded that the language expressing concern about departmental leadership was too subtle. Two issues were singled out as particularly problematic. First, the computer service support person is standing in the way of departmental progress in upgrading computer systems and software; he should be replaced. Second, the department chair needs to present a more positive image about the accomplishments and abilities of the current faculty. Alex Sanchez (Education) and John Selker (Engineering) will draft a letter summarizing the concerns of the Council. This letter will accompany the report as it is transmitted to the Provost. ♦ (Graduate Council minutes, May 22, 2003)

A letter drafted by Selker and Sanchez was distributed to the Graduate Council for review. The Council decided to ask Sally Francis (Graduate School) to share its views with participants at the meeting with the Provost rather than sending the letter. Observations by Francis will supplement the review report and discussions by parties involved in the review during the Provost meeting.

3. Category II Proposal for a Minor in Sport and Exercise Psychology

Brad Cardinal (Exercise and Sport Science) introduced a proposal for a new graduate minor in sport and exercise psychology. The purpose of the proposal is ♦to develop a recognized (i.e., transcript visible) graduate minor in Sport and Exercise Psychology. Students selecting this minor will develop a deeper understanding of the motivational, psychosocial, and lifespan factors affecting human behavior within the context of sport and physical activity settings. A theory-to-research-to-practice approach will be followed in the core coursework, with supplemental coursework focusing on the individual needs and interests of the students. ♦ (Category II Proposal)

Currently, students may select a minor in Exercise and Sport Science with an area of concentration in sport and exercise psychology. The students' ♦ transcripts make no reference to the area of concentration, which causes two problems. First, their work is not recognized for the skills acquired in sport and exercise psychology. Second, it overstates their skills in other areas such as biomechanics and exercise physiology.

Selker observed that very few courses (the three core courses for the minor) were available to support the minor directly. Cardinal explained that several elective courses outside the department were identified to complete the 15 credits required for a master's ♦ degree or the 18 credits required for a doctoral minor.

Barbara Bond (Forestry) asked how the minor would benefit or make a difference to students going into the workplace. Cardinal replied that the proposal was motivated by student requests to create a more

visible label for their graduate work. The visibility of the minor makes the courses easier to identify on their transcripts.

Francis asked why the Department of Exercise and Sport Science chose to request a minor rather than a graduate certificate, which would be just as visible on the transcript and could attract students who are not completing a graduate degree. Cardinal said that this would create ethical concerns because there is a nationally recognized certificate for practicing sport and exercise psychologists. Awarding a graduate certificate might imply that the graduate is licensed to do something that she or he is not prepared to do.

Dale Pehrsson (Education) agreed with Cardinal that many students from Counseling have chosen to take the sport and exercise psychology courses in the past in order to expand their career options. These students are looking for marketability, anything that gives them an edge. She asked how many students are most likely to select this minor. Cardinal said that there are currently about 10 students who he believes are likely to change their current minor to this minor. The availability of the minor may lead to a larger number of students selecting this option.

Selker asked whether students with this minor would qualify for the national certification with the proposed curriculum. Cardinal indicated that this would not be the case. Oregon State University lacks a clinical psychologist who could provide that necessary skill to round out the students' training. Also, students cannot even sit for certification without a PhD. Selker asked whether students might misrepresent their credentials. Although Cardinal thought this unlikely without the ability to document a clinical experience, he agreed that there was no guarantee that any student might not misrepresent his or her graduate education.

The proposal to create a graduate minor in sport and exercise psychology was approved unanimously.

4. Admission Task Force Recommendations on Alternatives to TOEFL

Two years ago Dean Francis established a task force on graduate admission standards. In its report dated May 22, 2002, several recommendations were made including:

The Graduate School, with the help of the English Language Institute, should monitor developments in English language testing with the ultimate goal of identifying and adopting a standard more useful than the TOEFL scores currently required. In the meantime, recognizing that it may be some time before a more useful language test than the TOEFL is uniformly available at international locations, international applicants should be encouraged, wherever possible, to submit alternative test scores that include evaluations of written and verbal communication skills.

The Graduate Council accepted that report on November 14, 2002 and agreed to review this and other recommendations at a later time. Bruce Rettig (Graduate School), who had served as liaison to the Task Force, explained that he had asked Deborah Healey, the Director of the English Language Institute to describe some of the limitations of the TOEFL and to provide an overview of some of the alternatives to the TOEFL that are accepted for admission of undergraduate international students.

Healey explained that the Test of English as a Foreign Language (TOEFL) is the most widely used tool to assess the ability of foreign applicants to pursue studies in the United States, but the examination has major limitations. It gives a snapshot of quick responses to questions and may not reflect the ability of the prospective student to use English effectively in the graduate student environment. It may be of greater value for undergraduate students who must study many subjects and therefore require a wider understanding of the English language. Pinpointing an acceptable score that would indicate an adequate understanding for graduate students is more difficult. TOEFL is only an indicator, and may not be of fundamental importance to judge the ability of graduate students to study at OSU. If graduate students are academically gifted and well trained in the subject matter they will study, they should be able to adjust to the Oregon State University environment. Although satisfactory performance at OSU requires an ability to speak and listen effectively, the TOEFL does not include a speaking component.

Alternative tests all have their good points, but in every case, an absolute minimum score may not be an effective screening method. The Michigan English Language Assessment Battery (MELAB) is not a good choice. It has had a reputation that some students could memorize and recite answers by rote; security of this examination has been a problem. As pointed out in a handout provided by Healey, the SAT is designed for native speakers, and thus more difficult for international students. A score of 500 or better on the verbal portion of the SAT should indicate acceptable English language skills in reading and

writing. It does not include listening or speaking, so will be problematic as a measure of readiness for graduate study. ♦ This contrasts with the TOEFL, which does not depend on being raised in American culture to answer the questions correctly. Nonetheless, high verbal scores on tests not designed for foreign students, such as the SAT or the GRE, probably reflect someone who is very well trained in English.

Selker expressed dissatisfaction with the TOEFL because it does not provide information about conversational skills, which is needed if the major professor is to be an effective mentor. Healey noted that the IELTS (International English Language Testing System) has an oral component that would provide a better predictor of the student's ability to understand verbal statements.

In response to a question about the correlation between understanding verbal communications and scores on TOEFL, Healey said that this is variable. Some students have no access to an instructor who speaks in English in the form that will be used in the United States, although they may have sound training in reading skills. Students with very high reading skills can understand information in their area fairly quickly. Does this make a promising student? Healey recommends that such students either be granted enough time to come up to speed with their English language skills or that they be denied admission. Admitting them and letting them fail is not a good option. She argued that OSU should bring in students who can contribute after bridging the language barrier. The diversity associated with many international cultures, which is gained by attracting these students, is well worth the effort if the student can be taught sufficient language skills in a reasonable amount of time.

Rettig observed that some of our peer institutions admit every international graduate student conditionally. If they do not develop sufficient language skills within some time period, usually one calendar year, they are dismissed. Healey added that these institutions sometimes require those students to move to a full time load of studying English at that time and do not allow them to resume their other studies until their language skill level meets the university standard. She suggested that this creates a high stress level, especially toward the end of the mandated trial period. She argued against this approach.

Brent Steel (Liberal Arts) observed that some nations do not have access to TOEFL. He also asked whether studies have been conducted to test how various scores relate to success in graduate studies in different disciplines. In response to the first question, Rettig observed that the IELTS is available in Iran, where some of our departments recruit graduate students. Healey indicated that the IELTS is offered in British embassies, which may address some of Steel's concerns about availability.

Healey repeated her earlier point that OSU does not want to set up artificial barriers to good students, but that we do not want to attract students who cannot succeed. The next version of TOEFL, which is due in two years, will have a verbal component and may show results similar to the IELTS.

The Council was very interested in expanding the alternatives to the TOEFL, especially if any of those options provide an indication of oral language skills. This is particularly true for graduate teaching assistants. Healey noted that students sometimes submit scores on the Test of Spoken English (TSE). When they do not, a variation on the TSE, called the SPEAK test, must be taken before a student begins work as a teaching assistant. The Council members requested recommendations for alternatives and specific scores for each. They requested a table similar to the one Healey shared for undergraduate TOEFL alternatives. She agreed to give the Council the information they requested.

The Council approved a motion to add the IELTS, with a minimum score of 7.0 as an approved alternative to the TOEFL.

5. Comments on the OSU Strategic Plan

On October 21, 2003, President Ray reminded the university community that a draft strategic plan was available for comment and set Friday, October 24, 2003, as a deadline to submit comments. That same day, Dean Francis sent comments to President Ray and asked Graduate Council chair Ciuffetti whether the Council might wish to comment, either on her response or on the strategic plan in general. One of the issues Francis identified was that it may be difficult to use GRE scores of entering students as a metric for measuring the quality of entering students because there is no university-wide requirement for GRE as an admission item, although many departments do require it for their individual programs. Selker argued that GRE scores should not be required campus-wide for admission, although this information is valuable in his department and in many other programs.

Council members supported Francis in her recommendation that the Dean of the Graduate School

should report directly to the Provost. Bond argued that the Dean of the Graduate School should report at the same level and have the same involvement in university governance as the Vice-Provost for Research. The Council unanimously approved a motion to this effect. Ciufetti agreed to send an email to President Ray, supporting the earlier message from Francis and emphasizing the concerns of the Council on this issue.

Graduate Council

October 9, 2003 Minutes

Present: Ciuffetti (chair), Bermudez, Bond, Collins, Fisk, Francis, Pedersen, Pehrsson, Rettig, Selker, Steel, Strickroth, Waldschmidt

Guests: Tammy Bray, Anna Harding, Douglas Markle

1. Introduction of New Council Members

Council members were introduced. It was noted that three positions on the Council have not yet been filled.

2. Committee Assignments

Council committee assignments for the year were distributed. Lynda Ciuffetti (Science) indicated that members should inform Bruce Rettig (Graduate School) of concerns or time conflicts by October 23, 2003. Ciuffetti distributed the Graduate Council standing rules and gave a brief overview of Council activities. Council members were reminded that the Graduate Council has enormous impact on all policies and procedures related to graduate education. Although other groups are engaged in specific issues and provide recommendations for improving graduate education, this is the group with responsibility for formulation and approval of policies. Martin Fisk (Oceanic and Atmospheric Sciences) asked about the status of the slash course policy. Rettig summarized steps taken on this issue last year and indicated that the 50% policy is now in effect for Fall 2005. The revised standards for graduate level learning requirements for new course proposals are also effective now.

3. Environmental Health and Occupational Safety Management Review Report

The Graduate Council conducted a review of the Environmental Health and Occupational Safety Management (EHOSM) program on January 30, 2003. Douglas Markle (Agricultural Sciences), chair of the review team, highlighted the review report's summary and recommendations, which follow. The detailed findings are included as an appendix to these minutes.

Commendation:

The Masters of Science in Environmental Health and Occupational Safety Management (EHOSM) is an effective and successful program with an estimated 100% placement of graduates in the field. The Department of Public Health and the EHOSM program are currently undergoing major changes including elimination of the undergraduate degree in Environmental Health and Safety, planned increases in EHOSM graduate students, and planned increases in faculty scholarship and grantsmanship. The Review Committee applauds the courage of the faculty, Department Chair and Dean for the very difficult decision to focus on graduate education quality rather than dissipate limited resources.

Procedural Recommendations:

We reviewed one degree program in a Department offering six graduate degrees. The Review Committee does not believe that piece-meal reviews of individual graduate degrees is best for departments, nor are they a realistic request of the Graduate Council. For example, some recommendations in this review, such as one on Graduate Teaching Assistants, are, of necessity, directed at the Department as a whole and not just this program. When the two-year follow-up for this review should happen, the Department will have an interim chair and will be in the midst of major changes. We recommend a follow-up review as scheduled. We also recommend that the Masters in Public Health (MPH) program review, scheduled for 2008, be changed to a review of all graduate programs in the Department of Public Health, including EHOSM. This review and follow-

up should be supplied to the 2008 Review team.

Recommendations:

1. Consider moving EHOSM to the MPH degree. Currently the M.S. in EHOSM is a non-accredited degree program with minimal enrollment, approximately 10 students. In contrast, the MPH program is accredited, ranked second nationally, and enrolls approximately 82 students in three distinct tracks (Public Health Promotion and Education, Health Policy and Management, and International Health). Five other tracks, including Occupational Health and Safety, are approved under the MPH program, but are dormant. The review committee feels the M.S. in EHOSM would be better located under the MPH program in an EHOSM track. This recommendation would offer several important advantages detailed in our report.
2. Consider eliminating the M.S. in Public Health. While this recommendation is admittedly beyond the charge of this committee, we feel the Department's new direction makes this an opportune time to re-evaluate a traditionally low-enrollment (currently only two majors) program.
3. Re-evaluate some core courses. We encourage expanding the required core to include an environmental health course, such as H 540 (Environmental Health). The purpose of H 542 (Environmental and Occupational Health), required only for the Occupational Safety (OS) concentration, is not clear. This course would seem to duplicate the core required for H 545 (Occupational Health).
4. Evaluate effectiveness of internships as a substitute for courses requiring instrumentation (H543 and H546).
5. Consider ways to promote more cohesion among all departmental graduate students especially during this time of change. This should include continuation of program strengths (orientation for new students, list serve & student handbook) but might include modifications such as a single graduate student handbook with recommended course sequences, a student-organized seminar series, a larger role on Departmental committees, or creation of a student lounge area.
6. Make Promotion and Tenure expectations clear to junior faculty and any new hires and mentor all faculty through the transition.
7. Continue the excellent external support of students and pursue more outside research funding, but recognize the difference between scholarship and grantsmanship, the fundamental priority of the former, and the importance of maintaining faculty morale, especially if dollar targets for outside grants do not materialize in a timely fashion.
8. Re-evaluate admissions requirements and expectations for students entering with non-science backgrounds.
9. Move cautiously as the GTA budget is reduced and regularly evaluate the impact.
10. Move forward on a certificate program in EHOSM as a way to address the needs of working professionals and increase total enrollment.
11. Conduct exit interviews of all graduates for on-going internal assessment of the effectiveness of the program and extent to which high placement rates are due to graduate quality or market demand.
12. Mentor entering students on the process of research, including research funding possibilities.
13. Consider giving graduate students a larger role in Departmental committees.
14. Develop a long-term strategy to improve or replace student office, laboratory and computing facilities.
15. Maintain the positive, mutually supportive relationship between faculty and administration during the term of the two-year interim chair.

Anna Harding (Chair of Public Health at the time of the review) agreed with the first recommendation-to switch the degree in environmental health and occupational safety management from an MS to an MPH. The faculty had discussed that option in the past and the review reenergized their conversations on this topic; they now wish to make that change. Before implementing it, they will need to carefully examine their faculty FTE to insure that they will meet accreditation standards. The change should be in place by next year. The MS in public health needs to remain unchanged until the faculty is better able to assess the future for that degree. They will discuss that recommendation, but cannot make promises at this time. They will provide a core class in environmental health as described in the third recommendation. Before acting on the fourth recommendation, the department must decide whether to continue to offer the instrumentation courses in question. Discussions are under way to seek a corporate sponsorship or perhaps a laboratory shared with other departments in the College of Health and Human Sciences. The

department agrees to the conclusion in the fifth recommendation describing how some master's degree students feel left out. They plan to work on this. Harding suggested that all graduate students work together to create a departmental seminar series; this was enthusiastically received. She may be the advisor for that series. The department would be pleased to be able to provide a student lounge, but space allocated to the department is not currently available to do this.

Tammy Bray (Dean, College of Health and Human Sciences) discussed recommendations 6 and 7. She thanked the Graduate Council for inviting her to join the discussion of the review report. Any change is difficult. She has listened to the questions faculty members have expressed about the expectations she has for them to secure grants. The changes reflect an evolution in expectations shared by the entire university. Land Grant universities can no longer consider research funding to be entitlements. As faculty members identify research ideas, they must make sure a great research idea is fundable. Bray recognizes that it will take much effort by the department chairs and by her to mentor the younger faculty. She described initiatives conducted by the College of Health and Human Sciences to support grant development. She believes that the Department of Public Health and other departments in the College would benefit greatly from hiring more new faculty and regrets the lack of money to do so.

Some faculty have asked whether it is appropriate to conduct scholarly work and publish research without securing external funding. Bray believes that the Public Health faculty have the greatest potential in her college for securing external funding because the faculty are young and energetic and conduct research in areas of wide public concern. External funding is available for addressing problems of bioterrorism, many health issues, community problems with chronic diseases, homeland security, and so forth. Funding in several of these areas is almost begging for applications. The directive to faculty is not to do this or else, but requests for proposals are available. If the problem is that no one has shown faculty how to apply for research funding, Bray is ready to assist.

Bray believes that holding a position as a graduate assistant involves more than simply providing financial support. A teaching experience is a valuable component of graduate education. If Public Health is going to become a research focused department, then graduate research assistantships should be emphasized. Teaching should become a central part of the educational experience. She is not planning to reduce support for graduate students, but she does want the faculty to think of teaching as an educational experience just as is the case for the research component. She definitely will move cautiously in taking budget support away from graduate teaching assistantships, but hopes that faculty will use grants to support graduate students and to provide students a research focus at the time the student is admitted.

Harding said that the concern about admission of students with limited science backgrounds requires careful evaluation of applicants. The Department recognizes the need to improve the communication of prerequisites in its marketing information. Students usually have a scientific background; the admission of students with limited scientific training has been a recent development. Admission information must be carefully assessed, with GRE scores as only one piece of information. For example, one student with low scores did very well in the MS program and has been admitted into another university's strong PhD program. The department continues to evaluate all pieces of information submitted by applicants. As the degree shifts from the MS to the MPH, the applicants are likely to be more highly qualified.

The Department is moving forward with developing a graduate certificate program and hopes to finalize the proposal by the end of this term. Harding described it as very innovative. It is directed toward working professionals, people in the state.

Harding disagrees with the priority on exit interviews. Public Health conducts surveys of students after graduation because alumni are less vulnerable at that point and are not as likely to tell faculty what they want to hear. She is concerned that students might be less forthcoming because they do not wish to jeopardize receiving favorable letters of reference.

Responding to recommendation 12, Harding explained that they have started a research group for graduate students. This involves having continuing students meeting with new students to provide peer support for the early stages of research.

Responding to the recommendation to involve students more in departmental committees, Harding explained that they are trying to streamline many departmental committees due to the heavy faculty workload. They do include graduate students on hiring committees. She doubts that the department will expand the involvement of students in the other, remaining committees.

The difficulty in expanding computing facilities is mostly a financial issue. The problem is not just in purchasing equipment but also in maintaining equipment used in a common environment. The current concerns are in meeting faculty computing needs. The department had a computer laboratory but, because of the problems just identified, it was eliminated several years ago. They will continue to consider this recommendation.

Bray added that she does have high expectations, but that this department has great potential for moving to the next higher level of quality and recognition. To do this, the department needs to emphasize graduate education and research. She is pushing hard but does not expect every faculty member to do the same thing. For example, some are excellent in teaching. Recognizing that the faculty is working very hard, she tries to be sensitive regarding how hard to push. She closed her remarks by thanking the review committee for its work. The review made the Department of Public Health and the College of Health and Human Sciences focus their thinking and it stimulated action in a positive direction.

John Selker (Agricultural Sciences) asked whether decreasing the role of graduate teaching assistants would increase the demands on the faculty to teach PH 312 (their large undergraduate course). Bray said that there should be a teaching practicum for new students instead of asking students to take over course entirely. As the number of graduate research assistantships increases, first-year graduate students will work with faculty while incorporating teaching as part of the teaching experience. With the teaching duties spread among a larger number of graduate assistants, each one should spend less time teaching. Selker questioned the need for increased faculty time in mentoring. Bray said this will be offset by the use of more fixed term faculty. Fixed term faculty can, and love to, teach large classes; this is their passion. She has mapped her plans out on a spreadsheet that reflects a principal involvement of graduate assistants in teaching during the first year. Such students would not be paid on grants until they are prepared to focus on research duties.

Selker asked again why students are not involved on existing committees. Harding replied that they no longer have a curriculum committee. Curricular proposals are now presented to the whole faculty. Markle asked whether a graduate student representative is invited to departmental faculty meetings. Harding responded negatively although this has happened in the past. Marie Harvey, the recently appointed interim department chair, is considering having an open portion of department meetings so that students can participate.

Markle was commended for the excellent work throughout the review process including a fine report. The report was approved as presented.

Appendix: Detailed Findings from the Graduate Council Program Review of Environmental Health and Occupational Safety Management

Introduction

On May 7, 2003, the Graduate Council review team visited the Department of Public Health to review the Masters of Science program in Environmental Health and Occupational Safety Management (EHOSM). Team members were:

Douglas Markle, College of Agricultural Science, Chair
Barbara Bond, College of Forestry
Michael Kassner, College of Engineering
Lynda Ciuffetti, College of Science
Stephen Arnold, New Mexico State University, External Reviewer

The Department's self-study report of the EHOSM Program was provided to the review committee. The detailed self-study was appreciated by the committee and allowed us to become thoroughly acquainted with the EHOSM program. A pre-review meeting was held on April 28, 2003, at which time a request was made for additional supporting information on faculty (curriculum vitae and appointment FTE breakdown). This information as well as the 2002-2003 Graduate Student Handbook and recruitment literature were made available during the site visit. The site visit provided the review committee an opportunity to meet with Tammy Bray, Dean, College of Health and Human Sciences; Anna Harding, Chair, Department of Public Health; the EHOSM and Department Graduate Faculty, Pamela Hanson, Administrative Assistant for Graduate Student Applications, and graduate students. The review committee was also taken on a tour of Waldo Hall facilities. A report from the external reviewer, Stephen Arnold, served as a first draft for this report. All committee members have contributed to and read the final version of the report.

The review includes an initial overview, followed by sections on Graduate Teaching and Advising, Faculty and Research Programs, Graduate Students, Facilities, and Administration. Table or page references in this review refer to the Department's self study.

Overview

The Masters of Science in Environmental Health and Occupational Safety Management is an effective and successful program with an estimated 100% placement of graduates in the field. EHOSM is one of six graduate programs in the Department of Public Health. There are two other MS programs (Public Health and Health Education), three Masters of Public Health programs (Public Health Promotion and Education, Health Policy and Management, and International Health), and two PhD concentrations (Health Education and Community Health). Of approximately 150 full or part time graduate students in the Department, ten (6.7%) are in EHOSM (listed as current in Table 5; if restricted to the approximately 105 active students, EHOSM students represent 9%).

The EHOSM degree was authorized in 1983 and the current review is the first Graduate Council review in the program's history. In 1993 the Faculty Senate approved Phase 1 of the Department's Category 1 Proposal to begin the inter-institutional Masters of Public Health (MPH) program. According to phase 1 of the proposal, the Department intended to put Occupational Safety in MPH and, during Phase 2, Oregon Health Sciences University intended to bring occupational/ environmental health into MPH. The Graduate Council Review of the MPH program is scheduled for winter, 2008, and could be concurrent with a scheduled CEPH review.

Although this review was to be of one degree program, the Review Committee does not believe that piece-meal reviews of individual graduate degrees serve departments, nor are they a realistic request of the Graduate Council. During the review, it was clear that the Department of Public Health and the EHOSM program are undergoing major changes: 1) elimination of the undergraduate degree in Environmental Health and Safety, 2) planned increases in EHOSM graduate students, 3) planned increases in faculty scholarship and grantsmanship, and 4) a new, two-year interim Department Chair from University of Oregon. These changes are occurring in a department that: 1) is described as invisible by some of its faculty, yet 2) has an MPH program ranked in a four-way-tie as the second best in the US among programs outside Schools of Public Health, according to US News and World Report, and 3) has a new dean who is asking for focus, interdisciplinary work and high quality.

The Review Committee applauds the direction the faculty has chosen and understands the substantial dislocation that those changes will cause. However, we also think that this review provides an opportunity to reevaluate EHOSM as well as other graduate programs. We therefore recommend serious consideration be given to two broad recommendations:

Move EHOSM to the MPH degree

Currently the M.S. in EHOSM is a stand-alone degree program with minimal enrollment, approximately 10 active students. In contrast, the MPH program enrolls approximately 82 students in three distinct tracks (Public Health Promotion and Education, Health Policy and Management, and International Health). Five other tracks, including Occupational Health and Safety, are approved under the MPH program, but are dormant. The review committee feels the M.S. in EHOSM would be better located under the MPH program in an EHOSM track and this is the number one recommendation of the external reviewer. This recommendation was reached as a result of our review but was, unfortunately, not a major part of our discussion with faculty. We understand that this is not a new subject for faculty, but think this is an opportune time for the faculty to reconsider the subject. This recommendation would offer several important advantages and is based on the following:

1. The MPH program is nationally recognized by the Council for Education on Public Health (CEPH), the premier accrediting body for public health programs.
2. The M.S. in EHOSM is not accredited.
3. By relocating the EHOSM track to MPH, the program would be fully eligible for CEPH accreditation, along with the existing tracks, which are already CEPH accredited. If the suggestion to relocate the EHOSM program is not pursued, the program is strongly encouraged to pursue ABET (American Board of Engineering Technology) or EHAC (National Environmental Health Science and Protection Council) accreditation for all of the benefits that accreditation provides.
4. Accreditation of the EHOSM program by CEPH would offer national recognition, increased enrollment, a larger and more diverse applicant pool, and on-going external review of the program. Most CEPH accredited programs have significant enrollment increases after being approved.
5. Location of the EHOSM program under MPH would better reflect the program's focus on human health, and distinguish it from other environmental programs that focus more on the ecological aspects of

environmental science.

6. Environmental Health (EH) and OS tracks are commonly located within MPH programs in Schools of Public Health nationwide. A complete list of CEPH accredited public health Schools and Programs is available on-line at www.ceph.org.
7. If the EHOSM program faculty so chooses, a thesis could be required for the EHOSM track under the MPH degree.
8. It is Dr. Arnold's belief that employers nationwide recognize the MPH degree as being at least equivalent to if not more appropriate than an M.S. for those professionals working in EH and OS.
9. The MPH degree is not viewed as a less scientific or watered down degree compared to an M.S., particularly if the MPH graduate completed a thesis.
10. Relocating the EHOSM program to a track under the MPH degree would, in the opinion of the Review Committee, be viewed favorably by current students, alumni, prospective students, and employers.
11. The Review Committee detected a sense of neglect of the EHOSM program in comparison with the existing MPH degree programs. This is not uncommon for a program that is not accredited, and which is not subject to the rigorous accreditation requirements and standards that CEPH demands.

Eliminate the M.S. in Public Health

The second broad recommendation of the Review Committee is to eliminate the M.S. in Public Health. While this is admittedly beyond the charge of this committee, we feel that:

1. Enrollment in the M.S. in Public Health is extremely low (currently only two majors) and enrollments historically have been low.
2. There is no indication that enrollments will increase in the foreseeable future.
3. Offering this degree only confuses prospective students; too many choices.
4. Faculty advising loads are already too heavy; the M.S. in Public Health only adds on unnecessary advising load.
5. Eliminating the M.S. in Public Health will assist the department in the dean's charge of narrowing the department's focus, presumably to do less but to do it better.

Overview Recommendations

- (for Department and Graduate Council) The College and Department are beginning major re-structuring of educational and research programs. At the scheduled time of the two-year follow-up for this review, the Department will have an interim, 0.5 FTE chair. We recommend that the scheduled MPH program review in 2008 be changed to a review of all graduate programs in the Department of Public Health, including EHOSM.
- Consider moving EHOSM to the MPH degree.
- Consider eliminating the M.S. in Public Health.

Graduate Teaching and Advising

The EHOSM curriculum is solid and faculty are experienced. Students receive exposure to all core subject areas commonly offered by graduate degree programs at other universities offering combined EHOSM programs. In general, the concept of a combined EHOSM degree program is sound, and reflects employment trends with greater emphasis on a well-rounded individual with knowledge in both EH and OS. For a combined degree program, such as the EHOSM, Dr Arnold recommends that the common core be as large as possible, and that each concentration be as small as possible. This allows for and promotes the maximum cohesiveness among majors, and ensures that each graduate is adequately exposed to both disciplines. The required (15) credit hour minor is a particular strength of the program, allowing students to focus their studies in a narrow area of their choice and based upon their professional interests. This is a unique feature of the OSU EHOSM program, which places our graduates at a distinct advantage in comparison to other universities.

Students in the EHOSM receive an appropriate balance of OS and EH course work, with one exception. The EHOSM (25) credit hour core is lacking a course in general environmental health. This places OS students at a distinct disadvantage. Despite the name of the degree, EHOSM, students pursuing the OS option may not complete a single course in environmental health unless they take H 542. The EHOSM program is strongly encouraged to expand the required core to include an environmental health course, such as H 540 (Environmental Health). The purpose of H 542 (Environmental and Occupational Health), required only for the OS concentration, is not clear. This course would seem to duplicate the core required for H 545 Occupational Health). If H 540 were moved to the core as suggested above, this would further support the suggestion to reconsider the purpose and function of H 542.

Courses requiring instrumentation (H543 and H546) are in serious trouble because of insufficient funding for modern equipment. The Department hopes that internships can provide students with some of the experience and skills that otherwise might have been provided by these courses.

The Department is involved in cross-disciplinary programs and in the development of additional interdisciplinary curricula. Cross-discipline sharing of courses within the department is admirable, and should be encouraged to continue. Having multiple faculty teaching various required and elective courses for students majoring in different areas only serves to strengthen and enhance the educational experience of EHOSM students. Enrollment of other majors in EHOSM courses demonstrates the importance and applicability of this area, and enhances the educational quality for all enrolled.

Required core courses are offered on a regular basis, once/year. Teaching loads are heavy, up to six classes per year. This can compromise scholarly productivity and professional service. The Dean has worked with department faculty to develop a plan to reduce teaching loads to four classes/year. Advising loads are disproportionately heavy for some faculty, so the relative weighting of advising, teaching and research needs to be clear to all faculty.

The departmental orientation for new students is an admirable strength. The Department has a Graduate Student Handbook for MS students that provides important information. With limited course offerings (once/year) the sequencing of courses is critical. Most students need a recommended sequence for their program of study and this might be more clearly described in the handbook. In addition, for prospective students considering which degree program to pursue, the handbook would be more effective if it included all graduate degree programs (MPH and PhD). This might also help promote more cohesion among all graduate degree programs. Because the program is going through changes, it is important to remember the various sources that students will examine and keep them current. We note that the Graduate Student Handbook has been revised and was submitted to the college webmaster in mid-June 2003. The graduate program e-mail list serve is a wonderful avenue for dissemination of job opportunities and other important news. This list serve should certainly be continued.

The thesis proposal and development timeline is a useful tool for students, and illustrates the program's commitment and student-oriented philosophy. The program currently requires a thesis or a project and expectations for both are clear. Although many graduate programs have replaced the project requirement with a prepare and submit a publication to the scientific literature requirement, we are not certain that a project-based MS should have a publication requirement since it could be a yet more time-consuming requirement than a simple thesis option. Perhaps the need for a project-oriented MS would disappear if a certificate program was initiated (see below).

Graduate Teaching and Advising Recommendations

- Expand the required core to include an environmental health course and reconsider the purpose and function of H 542.
- Evaluate effectiveness of internships as a substitute for courses requiring instrumentation (H543 and H546).
- Continue cross-discipline sharing of courses.
- Consider ways to promote more cohesion among all departmental graduate students.

Faculty and Research Programs

Faculty

Program faculty are dedicated teachers, active in the profession, and fairly active in scholarly activities despite heavy teaching loads. There was a deep sense of faculty loyalty and commitment to the students. Faculty are clearly student-oriented, and quality teaching appears to be the highest priority. Faculty scholarship appears appropriately balanced with their heavy teaching activities and students are engaged in these scholarly activities whenever possible.

The dean's five-year goal of at least half of the faculty securing at least half of their salaries plus GRA support for graduate students could be a difficult transition from the status quo. The Review Committee's view of this difficulty is not reflected by the current Department Head or faculty who are supportive of the dean, excited about the direction of the program and Department, and up-beat. The department's new goals and objectives, that emerged from the recent department retreat, reflect their enthusiasm, organization, and leadership.

We support the faculty's positive attitude and the dean's impressive support of increasing faculty scholarship, but also think the dean must understand the difficulty of the cultural change she is asking. This

will be most important for Promotion and Tenure expectations of junior faculty and for any new hires. The new expectations may be clear, but particularly in the changing environment that the dean is creating, it will be important to frequently review and mentor all faculty, but especially new ones.

During the on-site review, one faculty member seemed to misunderstand OSU's mission, stating for example, that OSU was no longer a land-grant institution. Faculty need to be clear on OSU's mission and land-grant status.

Faculty Recommendations

- Make Promotion and Tenure expectations clear to junior faculty and any new hires and mentor all faculty through the transition.

Faculty Research Productivity

The faculty actively publish research but are mostly doing this in collaboration with other researchers and students, and without large research grants. The list of external agencies and companies that have assisted in student research is truly impressive and the list of external program supporters is positive testimony to the collegiality and productivity of the faculty. The Dean's request for more outside research funding does not mesh with the recent research funding track record of the Program's faculty. A relatively modest estimate of the dean's target for faculty salary and GRA support (\$75,000 per year per faculty member) would seem a monumental change from the present situation. The dean's expressed confidence in the faculty and the faculty's enthusiasm for this change notwithstanding, we are concerned about faculty morale should the ambitious targets not materialize or not materialize in a timely fashion.

Research Program Recommendation

- Continue the excellent external support of students and pursue more outside research funding.

Graduate Students

Recruitment

Based on GRE scores and undergraduate GPA's, most students appeared to be adequately prepared for graduate level education in EHOSM. Faculty consider their students excellent, but there is no mold that entering students must fit. Rather, faculty say they are seeking and producing good problem solvers. However, the acceptance rate suggests most applicants are accepted to the program. From 1998 - 2003, only 5 applications were rejected out of 31, an 84% acceptance rate. One student told us she came into the program because she couldn't get into other programs and faculty reported a growing trend of entering students coming with non-science backgrounds. Such students are reportedly told they need to take additional science coursework, but actual requirements or pre-requisites are vague. Students are confused about requirements for chemistry courses, for example, including whether they need to take courses for credit or audit. There are no math or physics requirements. Also there seems to be no consistent expectation of basic science competencies for graduation. Clear and concise admissions criteria are needed. Much of the student advising is based on individual background and interests. Although this approach has merits, at least some students, if not the Program, would be better served with a more uniform set of admission requirements and expectations.

The number of students in the program is low, but total faculty advising loads are large. If the EHOSM program is to increase to the proposed goal of 25 students, the Review Committee sees problems. One approach would be to increase the number of GRA and/or GTA assistantships and possibly increase stipends to attract the best students. The Occupational Safety and Health training program, funded in 2002 and advertised on the Department web page, is an example of right direction and the type of support that is needed. However, the Dean plans to cut the graduate teaching assistant budget in half. In the Department of Public Health, GTAs generate 40% of the courses and about 95% are effectively course instructors rather than teaching assistants for a faculty instructor. Presumably, GTA-taught courses would be dropped or picked up by current faculty, who are expecting lower, not higher, teaching loads, and who are also expected to have higher scholarship and grantmanship output. If the GTA savings are invested in new tenure track faculty with the expectation that they will secure (on average) 25% of their salaries plus graduate student support (modestly, \$75,000/yr), the risks to the teaching program could be large. The dean appears to be aggressively pursuing improved quality by asking that faculty bring in research support for graduate students and free up other money to help grow the tenure track faculty. The Review Committee is not trying to second guess the Dean or the Department, but we do not clearly see how these changes will mesh together to produce the desired results. Communication in the Department and College seems good and we think it will be necessary to keep administrative feed-back loops open during this process and move cautiously.

A second strategy to increase the number of EHOSM students and to address the needs of working professionals is the certificate program being considered by the Department. The graduate certificate program could be an ideal opportunity to increase the number of students in the EHOSM program. Administrative and mentoring costs per student should be much lower than typical graduate students and the Department is considering the possibility of rolling the certificate courses into the masters program. The creative ways the Department schedules classes to accommodate current working professionals is also being further explored. The Department might be able to work with the Graduate School to design a summer term certificate or produce some courses in a distance education format to take advantage of the teaching strengths in the Department. Although we encourage the Department to pursue these possibilities, we do so with the caveat that a certificate program should not compromise or impact the quality of the EHOSM Masters program.

Financial support

When students enter the program, few receive support. In part, this is the nature of the students, some are working professionals with full time jobs and are part time graduate students. Of the 10 current EHOSM students, only 3 are on a graduate assistantship of any type and only one of the 10 is on a GTA. Faculty report that if graduate students are supported, the GTA is usually at the 0.25 to 0.30 level. GTAs receive a one day orientation/mentoring session. Compared to comparable programs, though, graduate assistant stipends and tuition waiver are better than comparable institutions and are potentially a good recruiting tool.

Post-graduate placement

It appears that the placement of graduates within the field is 100% with graduates obtaining salaries that surpass program faculty salaries. For the period 1998 to 2002, the program graduated 18 students. The high placement rate of graduates might be market-driven or might indicate that the application process described above is working to produce the right type of student. In support, one student whose three GRE scores were all below 460, has been accepted into a PhD program at the University of Massachusetts.

The Department maintains an excellent list of student statistics, however formal exit interviews are not conducted. For some programs, such as MPH and the undergraduate program, surveys are associated with accreditation. We believe the Department should have some mechanism at or near graduation to evaluate student satisfaction and obtain feedback for program improvement.

General Graduate Student Recommendations

- Re-evaluate admissions requirements and expectations for students entering with non-science backgrounds.
- Move forward on the Graduate Certificate program in EHOSM
- Move cautiously as the GTA budget is reduced and regularly evaluate the impact.
- Conduct exit interviews of all graduates.

Student concerns

Class scheduling is an important concern for EHOSM students. Classes offered only in afternoon or more than once a week are difficult to schedule for some students. Evenings are better for those working full time or even those with full time at-home responsibilities. One class/week for a larger time block is a much preferred format while weekend classes had a mixed review from the students who spoke with us. Students are also interested in the possibilities of distance education, teleconferencing, and WebCT.

In general students seem very satisfied with their education and expressed the opinion that the faculty want to see them succeed. Faculty do a good job helping students make professional connections. Outside resources/guest speakers are all very much appreciated. However, some students were totally unclear on requirements in background science courses. Faculty also shared concerns about incoming science requirements. As is true across campus, students feel that the quality of instruction would be improved if there were fewer slash courses and more stand-alone graduate courses. Some expressed interest in a second biostatistics course and the Department indicated they would be developing a statistics sequence in the college to serve the needs of all of the graduate students. Students appreciate the flexibility and availability of the Minor.

The primary shortcoming is exposure to, and use of, modern equipment and instrumentation used in the profession. ♦Labs are completely under-funded♦, to quote one student. As is true of many good graduate programs, students said that a lot of learning takes place outside of class. Ideally, this would happen in a lab group or some other cohesive group including a faculty mentor. Students would love to assist faculty on research projects as GRA♦s and for mentorship. Although faculty report that students are involved

whenever possible in faculty research projects, students perceive limited opportunities for such involvement. Students indicate that they must be proactive and look for laboratory opportunities in Toxicology or Chemistry, but that inter-departmental communication is not good and they are not always welcomed in other labs. Some students do make successful contacts in labs in other departments, so disgruntled students may not be completely representative of this situation. However, incoming students seldom understand the research process and the number of ways that research can be accomplished. Some wished that they had known early in the process to look for small grants to fund their project. As the number of students grows, the Department should keep in mind that membership in a research group is often an important part of graduate education. The number of those research slots, rather than an arbitrary target, might be the best indicator of future enrollment goals.

Faculty report excellent faculty-student interaction, saying ♦this is a real strength in what we do.♦ Some students, on the other hand, report feeling isolated. The level of extra-curricular interaction among students and between students and faculty appears to be much lower in EHOSM than in MPH. Students are not routinely part of department committees and do not have a computer lab/reading room/community space. EHOSM does not have a seminar series and there are no departmental-level social events, though some programs (MPH) do have social events. For some students, these ♦student community♦ issues, both at the Departmental and Program level, create a feeling of being adrift. They expressed the opinion that regular meetings of students and faculty would help alleviate the feeling of isolation and working in a vacuum. The Review Committee♦s perception may have been accentuated by students who lack a lab group. As noted previously, students appreciate outside speakers and contacts. One way to have a seminar series is to let students organize it. A student committee with experienced and new students could be responsible for bringing in one speaker per term or weekly speakers during one term per year. A small budget to help with travel and entertainment of speakers also gives students good professional experience.

Student Concerns Recommendations

- Mentor students on research funding.
- Consider giving students a larger role on Departmental Committees.
- Consider a student-organized seminar series.

Facilities

The facilities available to the EHOSM are humble, at best, but faculty office space and computing resources appeared to be adequate. It is unfortunate that the department office is located apart from faculty offices and that there is no conveniently located conference room. Space for graduate students is inadequate. The program would be significantly enhanced with the addition of a student study area and a student computer lab. Student computing facilities are inadequate.

Laboratory resources for students and faculty are admittedly insufficient. Contaminant sampling and analysis of chemical, physical and biological hazards is a critical component of EHOSM. In particular, industrial hygiene and water sampling equipment and instrumentation is a key component of the EH and OS fields. While the lack of facilities is not fatal, it does force the program to pursue an educational and research focus that is very different from programs with better laboratory instrumentation and space. An immediate solution is not obvious, though the Department♦s plans to be active participants in the OSU community and to increase research funding should begin to help. Prospective students, current students, alumni, potential donors and employers should continue to be reminded that the program does not have a laboratory/instrumentation focus. The Dean♦s on-going efforts to gather information from stakeholders might include this reminder. In the interim, program efforts to expose students to laboratory/instrumentation through other means are admirable and should be continued (internships, class field trips, guest speakers who bring portable instrumentation, research assistantships).

Perhaps the biggest problem with facilities is the potential negative image of older facilities coupled to a modern technical discipline. The review committee felt that there might be circumstances when EHOSM facilities would not contribute to an otherwise favorable image with prospective students, new faculty recruits or prospective donors.

Facilities Recommendations

- Develop a long-term strategy to improve or replace student office, laboratory and computing facilities and laboratory equipment.

Administration

Overall responsibility for leadership and administration in the Department of Public Health rests with the

Department Chair. The current Chair has held the position since 1998 and will resign in September 2003 to pursue more scholarly activities in the Department. An interim chair (0.5 FTE) will be shared with the University of Oregon and will serve two years. Support staff, internal governance and committee structure appeared to be adequate, but students were not involved in departmental and program governance. Greater involvement of students in programmatic governance would likely have many benefits. Faculty and administrators, including the dean, appear to have a positive, mutually supportive relationship.

Administration Recommendation

- Maintain the positive, mutually supportive relationship between faculty and administration during the term of the two-year interim chair.

GRADUATE COUNCIL MEETING

June 12, 2003

3:00pm, Kidder Hall 128

Present: Brauner (chair), Bird, Ciuffetti, Collins, Feller, Francis, Gobeli, Markle, Rettig, Sanchez, Selker, Strickroth, Watrous

Absent: Bond, Fisk, Pedersen

Guests: Joseph Krause, Kay Schaffer, Juan Trujillo

I. Approval of Council Minutes

Lynda Ciuffetti (Science) commented on the usefulness of having names associated with comments within the minutes and asked why they had been suppressed in the most recent minutes. Bruce Rettig (Graduate School) said that one Council member had asked whether the minutes needed to be so lengthy and that he had reduced the most recent minutes while keeping all names that were required to understand the points being made. David Brauner (Liberal Arts) noted that minutes have been more closely scrutinized this year, but that the Council had decided at one point earlier in the year to continue having very detailed minutes. The minutes of the meeting of May 22, 2004, were approved as distributed.

The Council also agreed that the minutes from this meeting (June 12, 2003) would be approved by Council members by email during the summer.

II. Category I Proposal for a Master of Arts in Contemporary Hispanic Studies

Following its meeting on April 10, 2003, at which a proposal to establish a Master of Arts in Contemporary Hispanic Studies had been presented, the Graduate Council forwarded the following requests to Joseph Krause, chair of the Department of Foreign Languages and Literatures (FLL).

- Revise the budget to address the question of adequate FTE and clarify the budget line item concerning GTAs.
- Examine the list of courses in the integrated minor and consider adding courses that provide a large-scale perspective such as might come from courses in economics or additional courses in political science.
- Clarify the language defining the capstone experience. Specifically, is the capstone a thesis option, which would require 6-12 credits, or a non-thesis option, which would include 3-6 credits of research-in-lieu-of-thesis (commonly research or project credits)?

Krause, accompanied by Kay Schaffer, Dean of the College of Liberal Arts, and Juan Trujillo, from FLL, returned to the Council to present a revised proposal that addresses those questions.

Krause circulated a listing of core courses for the proposed Master of Arts in Contemporary Hispanic Studies. The degree would require a total of 48 credits including 27 credits in core Spanish and Linguistics courses, 6 credits for field work and a non-thesis project, and a 15-credit intercultural communication minor drawn from courses in other departments. Krause explained that he expects to generate savings from hiring more graduate teaching assistants and fewer instructors; he believes the department will follow that staffing strategy. The revised document distributed to the council indicates that 2 graduate teaching assistants would be hired with funding from the College of Liberal Arts. This personnel strategy should allow a regular faculty member to teach one additional graduate course in the first year of the program. In response to a question from John Selker (Engineering) whether that is a savings of one course per term or per year, Krause said that the savings is one course per term. In the year that the program begins, a national search for a new tenure track faculty member would be undertaken, with that new hire to teach two new graduate level courses in the second year of the program, resulting in a total of three new courses by the end of the second year. A key feature of the program is the use of learning communities. Each would last for approximately three terms and involve two or three faculty members from FLL, one or two faculty members from other departments, and the cohort of students.

Krause said that, after examining the courses in the Department of Economics, he and others in FLL did not find any courses that directly related to the minor theme (intercultural communication). He also doubted that the students enrolling in the program would have the necessary prerequisites to take graduate courses in economics. He added that the proposal had been edited to remove reference to a thesis and to provide clarity about the project requirement. These changes were made specifically to answer the concerns of the Graduate Council members; he expressed hope that those changes enabled passage of the proposal.

Selker asked whether any of the listed courses were slash courses. Krause said that the new courses would be standalone graduate courses and that some of the other courses, now listed as slash courses, would be converted to standalone by Fall 2005. However, several courses would remain as slash courses.

David Gobeli (Business) questioned the value of the program, given that it is intended to graduate only six students per year, which seemed small for the major efforts at shifting work and funding. Brauner noted that graduate students with other majors, including Anthropology, serve as graduate teaching assistants and suggested that the undergraduates are served well by foreign language instructors whose first language is the subject of the course. Selker asked whether the excitement in CLA is related to the fact that FLL has no other master's degrees. Brauner and others pointed out that FLL participates in the MAIS and provides the specialty courses for a teaching credential as part of the Master of Arts in Teaching. Brauner argued that the other incentive for creation of the program is a growing number of Hispanic students at OSU, who are very interested in this program. The need for the program is also related to the growing Hispanic population in Oregon.

Selker observed that, during the discussions of new degree proposals in the Faculty Senate, the question is often raised where the money is coming from. With limited OSU funding, any new

programs must imply a reallocation from somewhere else within a college. On the other hand, Selker asked whether the role of the Graduate Council is to question the source of funding or whether the sole focus should be on the academic rigor of the graduate program proposed. Rettig said that the focus should be on the quality of the graduate experience from proposed graduate programs, but he added that finances become an issue if the lack of funding affects the ability of the unit to offer an appropriate graduate learning experience. Sally Francis (Graduate School) pointed out that the issue regarding finances at the first meeting considering this proposal was an issue of adequacy of funds, rather than the source of the funds.

The proposal to create a Master of Arts in Contemporary Hispanic Studies was approved unanimously.

Following the approval, the Council discussed whether the budgeted graduate assistant appointment (0.25 FTE to offer one class session) met university standards. Rettig noted that there is a wide variability of expectations across campus, but that there is precedent for using that level of appointment.

III. Zoology Follow-Up Report

Susan Tornquist (Veterinary Medicine) reported on a conversation with John Ruben, chair of the Department of Zoology, and Bob Mason, chair of the Biology program and a faculty member in Zoology (see Appendix A for the full follow-up review report). A combined graduate and undergraduate program review had been conducted two years earlier including a site visit on May 14, 2001.

Since the program review, important changes have occurred in both faculty and administration. Departmental leadership shifted from Stevan Arnold to John Ruben; four faculty members retired; and the department is currently interviewing to fill two faculty positions. Tornquist said that the Zoology graduate programs are doing very well in spite of inadequate faculty and funding. Their strategic plan for new hiring is designed to build on their strengths. Ruben said that the Dean of the College of Science has been very supportive, especially in providing funding that permitted the hiring new faculty members. Responding to a recommendation to recruit Research Associates rather than fixed-term instructors, three new post-docs were hired to fill in for retired professors. The department increased stipends for graduate assistants, making the department more competitive in attracting graduate students. A newly appointed Graduate Program Director, Barbara Taylor, now advises students regarding policy and procedures. Four or five faculty members from the Entomology Department, which ceases to exist at the end of June, 2003, will join the Zoology Department. Following the follow-up review, Tornquist felt that the department has done well with the primary recommendations.

Secondary recommendations have also been addressed and progress is being made on them. In response to concerns of the graduate students about summer registration, the new program coordinator has made clear that the department does not require summer term registration if the students are not using university resources to pursue their degrees. Work by the department webmaster has improved the department's website. Ruben expressed dismay that the admissions

procedure is slowing down response of the department to good students and is causing the department to lose some of the strongest prospective students. Course offerings are experiencing less flux because of the oversight and planning by the graduate program coordinator. The department chose to not change 500 level courses to 600 level courses as recommended. Some teaching laboratories are slated for renovation. Staff problems have been resolved by turnover of personnel. The department continues to maintain a good reputation nationally and internationally. The department carries out an annual review of each graduate student, and most of the students go directly into tenure track positions rather than into postdoctoral positions after graduation. The rotation of the department chair position works well in this department.

Barbara Watrous (Veterinary Medicine) asked whether Tornquist was concerned about the department's choice to not change 500-level courses to the 600 level. Tornquist said that this recommendation had originated with the external reviewer, but that she was satisfied with the department's decision on this matter. Their rationale was that if they changed from 500 to 600, master's students in other departments would overestimate the difficulty of the courses and would not choose to take them. Responding to Ciuffetti's question about the difference between hiring fixed-term instructors and post docs, Tornquist said that the origin of the strategy for hiring fixed-term instructors was the period of a large debt burden in the College of Science. The department has concluded that postdocs would benefit from gaining the teaching experience that could improve their abilities to be hired into tenure-track positions after working with the department. Francis recalled that department was responding to requests from postdocs in the department for teaching experience. Wende Feller (Graduate Student) asked who opposed the change, students or teachers. Tornquist said that the majority of faculty members were happy with the change, as are the postdocs. Francis asked that the report be corrected by changing "Graduate School" to "Office of Admissions" on page 3, paragraph 4. Alex Sanchez (Education) asked why they use the title "Coordinator/Director". Tornquist said that both terms were used interchangeably. Sanchez asked that the official title be used in the document.

The follow-up report was accepted with the minor corrections identified by Francis and Sanchez.

IV. Graduate Certificates (Minimum Number of Credits)

During the previous Graduate Council meeting, Council members discussed a possible reduction in the minimum number of credits required for a graduate certificate.

Selker asked whether the Faculty Senate would also be voting on this proposal, as was done with the original proposal in 2000. Francis said that the earlier proposal created a brand new credential not previously awarded at Oregon State University. Creation of a new type of credential required full consultation and approval from Oregon State University and acceptance by the Oregon University System. In contrast, because this is a change in an approved graduate policy, she does not believe that the full approval process is needed. Because Portland State University's guidelines allow as few as 15 credits for a graduate certificate, 18 credits at OSU should not create concerns at the OUS level. Rettig noted that the Sustainable Natural Resources (SNR) Certificate proposal, if approved in its 18-credit version, would allow all bodies to consider this change. If the SNR 18-credit proposal passes the Graduate Council, the Curriculum

Council, and the Faculty Senate and is approved by OUS, all these bodies would implicitly be endorsing the new 18 credit allowance. At any step, they could explicitly debate the change. If they disagreed with the new guidelines, they could return the SNR proposal to the Graduate Council with a request to consider the 24-credit version offered as an alternative.

Selker observed that 24 credits exceeds the maximum credits permitted for graduate students (16) for a single academic term. Normally, an 18 credit graduate certificate would have to be associated with two or more quarters. Rettig said that the decision to change to 18 credits, if approved by the Graduate Council, would be communicated to the Curriculum Council and Faculty Senate so that they could decide if they want to decide the questions (approval of the SNR certificate and approval of the new 18 credit minimum requirement) as two separate issues. Although he was concerned about the lack of justification for the change, Selker indicated that he would favor an 18-credit certificate. Francis said that the original number (24) was decided by a sub-committee of the Council. She believed that this group chose this number because it was toward the high end of the number of credits in graduate certificate programs across the country. That number was also chosen by the committee as an indication of the rigor of the program. Feller noted that 18 is an appropriate number of credits because it is more than what is required for a minor, but less than what is required for a full major. Francis noted that this is a credential that can be earned, can be hung on a wall and can serve as a proof of achievement at the graduate level, even if one never earns a graduate degree. Gobeli suggested that market demand would be even greater if the number were 15. The Graduate Council may face pressure to lower it to 15 in the future and may wish to consider that lower number at this time. Selker suggested that students who are earning the certificate would be allowed to register for 18 credits per term without having to fill out the Course Overload forms. Rettig said that course overload forms for 18 credits are currently approved whenever students are informed that additional costs will be levied on the student (the current registration plateau allows one bill for anywhere from 9 to 16 credits) as long as the student has a strong academic record and is not likely to face academic difficulties by carrying this higher load.

The Council approved a motion to reduce the minimum number of credits from 24 to 18. The revised policy on graduate certificates now reads:

The Graduate Certificate Program at Oregon State University is a structured progression of graduate level courses that constitute a coherent body of study with a defined focus within a single discipline or a logical combination of disciplines. It is designed for a student who has completed a baccalaureate degree and is in pursuit of advanced-level learning. Graduate certificates reflect the educational mission of the University. All certificate programs require a minimum of eighteen (18) graduate credits with a cumulative grade point average of 3.00 or greater. Students desiring a graduate certificate must be admitted to the University as a credential-seeking graduate student, but are not required to be on track for a specific degree. There is no formal committee requirement for graduate certificates. Certificate students are subject to all general policies governing the courses for the Master's Degree.

In addition to approving a change in minimum credits for a graduate certificate, the Council also adopted a proportionally lower number of credits that would be allowed as transfer credits.

Instead of the previous allowance of 8 transfer credits (one-third of 24), the number of allowable transfer credits toward a graduate certificate is now 6 (one-third of 18). The section of the guidelines for implementing the graduate certificate policy that refers to these numbers now reads:

The certificate curriculum is a structured progression or collection of courses approved and offered for graduate degree credit at OSU. The curriculum consists of a minimum of eighteen (18) quarter credit hours, and may include a final project, portfolio, or report for integration of the sequence of course materials. Up to 6 quarter credit hours may be transferred toward an 18 credit hour graduate certificate.

V. Category I Proposal for a Graduate Certificate in Sustainable Natural Resources

A proposed new graduate certificate in sustainable natural resources was presented to the Graduate Council at its meeting on May 22, 2003 by Steve Radosevich and Denise Lach. At that meeting, members of the Council expressed concern about the intensive nature of a 24-credit, 14-week summer institute and recommended that Radosevich and Lach revise the proposal to one that would require 18 credits. The revised proposal addressed those concerns by reducing the credits required in three of the courses, but with the major adjustment in the capstone project course. Gobeli asked if this was not a 24-credit hour program disguised as an 18-credit hour program. Rettig said he believed there had been a substantive change in Projects to make this a true 18 credit hour program. Selker remarked on the high regard fellow faculty members have for Steve Radosevich. The program is to be taught by faculty with strong research and teaching credentials. Those faculty members are showing such a high level of excitement and creativity that Council members thought the certificate program should be attempted. The 18-credit version of the Category I proposal for the certificate in Sustainable Natural Resources was approved.

VI. Other Business/Announcements

Rettig said that he had never before seen a workload for a Graduate Council like that shouldered by this Council. Problems with lack of quorum, encountered often with past Councils, have not happened at all this year. He thanked the Council for all their hard work and commitment during the year. Francis seconded that thank you and expressed the appreciation of the entire campus for the work and preparation of the Council. Sanchez expressed his appreciation to the staff of the Graduate School and especially to Renee Windsor as secretary of the group.

Feller noted that she might not be able to serve on the Graduate Council next year due to changes in her assistantship and the fact that she will not be serving as president of the Graduate and Professional Students Association (GPSA) next year. Rettig encouraged Feller to work with the Associated Students of OSU and apply to serve as the designated graduate student member, even if she is no longer in the GPSA position.

Appendix A:
Follow-up Review of Zoology Graduate Program Review
March 5, 2003
Susan Tornquist and John Selker

The follow-up review of the Zoology Department's graduate program review was conducted March 5, 2003. The original report and recommendations were written following a site visit on May 14, 2001 and included a review of both the undergraduate and graduate programs. The follow-up addressed only the graduate program and consisted of a review of the 2001 report and a meeting with John Ruben, current Department of Zoology chair and Bob Mason, Chair of the Biology Program and Zoology Department faculty member. At this meeting, each of the primary and secondary recommendations made in the original report were discussed as they pertain to graduate education.

Since the 2001 report, there have been some significant changes in the Zoology Department. John Ruben, the new department chair, assumed his duties in June, 2002. There have been 4 faculty retirements since 2001, and at the time of the follow-up review, there were candidates interviewing for an open faculty position. The department appears to have retained its excellence in research, teaching and reputation in the face of continued budget reductions at the University. Several specific improvements have been made in the graduate program and these will be addressed under discussion of the specific recommendations that follows.

Primary Recommendations

1. Prioritize new faculty hires across the department. Work with the Dean to implement a strategic plan that will increase the number of tenure-track positions in the department and replace retiring faculty in a timely fashion.

The department, in its strategic plan, focused on retaining and building on its existing strengths. Plans for new faculty hires are based on filling deficits in certain areas left by retirements. The current greatest need is in conservation biology or ecology. Thus the candidates currently interviewing were in the general area of Ecology/Evolution/Behavior. The next hire is projected to be in the area of Cell Biology/Physiology, an area that has a very high teaching component within the department. Dr. Ruben expressed the opinion that the Dean has shown his intentions to maintain Zoology as a strong unit and has been supportive of the department.

2. Develop a teaching internship program for research associates that would allow them to gain experience and develop expertise in teaching. These research associates would teach part of the year and conduct research part of the year. This might help alleviate the faculty shortage for undergraduate teaching and avoid many of the problems associated with adjunct faculty who only teach.

This recommendation has been adopted by the department and appears to be successful. There are currently 3 post-doctoral research associates who have been hired to help teach undergraduate courses in conjunction with their research appointments. Each of these research associates is in charge of a major undergraduate course with a large enrollment. All are pleased to be gaining teaching experience along with further research experience. The teaching load of other faculty members has not decreased by having the research associates assigned to lead

courses, but the impact of retirements on the teaching assignments of remaining faculty members has been lessened.

3. Increase stipends for graduate assistants in the department.

Much effort was put into increasing graduate student stipends and this has been accomplished as a two-step process. The first stipend increase came entirely out of department funds with the second being funded 50% by the department and 50% from funds provided by the Dean. The current stipend is \$16,500, which is just below Biochemistry/Biophysics at Oregon State University, and still about \$1000/year less than what the department would like to offer. The feeling is that these increases have made the department much more competitive for attracting top graduate students.

4. Conduct regular curriculum committee meetings with a liaison from each research cluster and a graduate student representative. Include the identification of relevant graduate courses offered by other campus units and inform Zoology students.

A major change was made in administration of the graduate program that has impacted this recommendation. A Graduate Program Coordinator was appointed to replace the Graduate Program Committee and Graduate Admissions Committee in the department. The Coordinator is a member of the graduate faculty, has been appointed for a 3 year term, and has part of her salary paid specifically to serve in this capacity. She advises students about policies and courses, including relevant graduate courses in other units, acts as an advocate for students and maintains confidentiality of her interactions with them. The presence of a Coordinator for the graduate program has facilitated enforcing the letter and the spirit of the rules for graduate programs and exams.

The graduate curriculum committee has not been meeting regularly since the appointment of the Coordinator. There will be 5-6 new faculty coming into the department from Entomology in the fall of 2003, and it is anticipated that more regular meetings will be held following this addition. There are graduate students on the committee and it currently meets as needed.

5. Continue to press for adequate funding, both internally and externally in support of facilities as well as staffing and faculty hiring.

The Department has had the support of the Dean in securing resources to maintain its quality and reputation. Drs. Ruben and Mason felt that the department was successfully recruiting candidates of excellent quality. This is in spite of continued budget restrictions and cutbacks.

Secondary Recommendations

1. Offer a departmental welcoming orientation for research assistants and associates and prepare and distribute a handbook with useful information to newcomers. Encourage research assistants and associates to initiate and organize informal gatherings to enhance socialization and the exchange of ideas among themselves.

The department chair has encouraged the research assistants/associates to form an association to promote interactions and exchange of ideas. While this has not occurred, there have been several steps taken to make research assistants/associates feel more a part of the

department including giving teaching assignments to RAs, and having the RAs meet as a group with individuals interviewing for faculty and other positions. The RAs appear to be more involved with the department and to appreciate this increased involvement.

2. Investigate the need for all graduate students to register for credits over summer, making sure to communicate to students the rationale for any policy implemented.

Graduate students must continue to register for the summer as this is a University, not a departmental policy. The reason for this policy (e.g. use of library and other University facilities even though students may be doing field work), has been communicated to the students.

3. Ensure that students and faculty are aware of existing departmental policies and that the policies are consistently enforced.

The Graduate Program Coordinator has taken on the responsibility of making sure that policies, such as those that determine conduct of oral preliminary exams, are followed uniformly.

4. Continue to invest in the development of the department web site, including features that target graduate student recruitment.

Maintenance and development of the departmental web site has been assigned to Traci-Durrel-Khalife. A review of the web site at the current time shows it to be well-designed, informative, and easy to use, with multiple links to information that prospective students would need.

A change in the Office of Admissions policy for admissions has created some problems for the department. Instead of potential graduate students contacting the Zoology Department directly, they apply for admissions through the Office of Admissions first. The Department has experienced problems in that applications from potential graduate students have not been forwarded to the department in a timely manner and some materials have gotten lost. There is a concern that some good applicants may be missed because of this.

5. Seek external funding to supplement student stipends and engage the Zoology Board of Advisors (ZboA) in the process.

Faculty in the department are continuing to achieve success in gaining external funding for research, but there have been no significant new sources of external funding for graduate student stipends. The U.S. Department of Education Graduate Assistance in Areas of National Need (GAANN) five-year training grant will continue to provide some funding for two more years.

The ZboA has not been highly active in the last few years, even though it continues to exist. Many of the members are from the Portland area, and it can be difficult to bring together the members for meetings.

6. Improve coordination of course offerings.

The course offerings still experience flux as there has been turnover in departmental faculty. The appointment of the Graduate Program Coordinator has addressed the problem to certain extent in that students are better informed of courses that are being offered.

7. Review department 4xx/5xx offerings and bring them into alignment with university criteria for distinguishing the two levels.

For the most part, the 4xx/5xx courses are in compliance with the University policy and students taking 5xx courses are required to complete extra work, have a different grading scale, etc.

8. Consider altering some course numbers from 5xx to 6xx to better reflect the departmental focus on its doctoral program.

The department decided not to make this change in order to maintain the most flexibility and to allow more universal access to courses.

9. Train faculty and staff to deliver better information to all students regarding departmental course offerings and relevant offerings in other campus units.

Once again, the presence of a Graduate Program Coordinator has directly addressed this issue in that she is able to advise students on courses both within and outside of the department.

10. Upgrade department facilities, addressing the worst first.

Renovations of three research labs and the Anatomy/Physiology teaching laboratory are underway. These facilities were chosen for renovation because they represented the most urgent needs in well-funded research labs and a heavily-used teaching laboratory. Funds for renovations came from departmental funds, returned overhead, and some from the Dean.

11. Clarify and strengthen both the internal and external potential of the ZboA and integrate its members more fully into the academic and social aspects of the department.

As mentioned earlier, the advisory board is still in existence, but has not been very active for a variety of reasons, including the numerous staffing changes that have been taking place in the department and the busy schedules of advisory board members. The department, along with the ZboA, has a goal of raising 4 million dollars for an endowed chair, and has accumulated approximately half that amount. The ZboA will continue to be utilized in this fund-raising effort.

12. Address concerns of departmental administrative staff relative to the working relationship with the PISCO administration.

The communication issues and problems with the working relationship between PISCO and Zoology department personnel have improved, in the words of the department chair, 1000%, due primarily to turnover in personnel. There are currently no apparent problems between the two entities and relations are cordial.

13. Remain informed regarding standards of other high quality programs and advocate on behalf of the department's needs on campus and with the ZboA, in recognition of the absence of external review agencies in the field.

The faculty of the Zoology department have continued to be very visible in the field with faculty members frequently speaking at other institutions and meetings and an active departmental seminar program that invites speakers from other institutions. These interactions have kept faculty members well informed and connected with those from other programs. The

fact that 14 of 16 faculty members are funded by NSF or NIH indicates the quality of the research and the competitiveness of the faculty with those from other institutions.

14. Develop effective assessment protocol with follow-through capability.

The department conducts an annual review of each of its graduate students. This includes a careful review of graduate student teaching. Departmental graduate students have achieved great success in obtaining post-doctoral positions and faculty positions on completion of their programs. In addition, they have been quite successful at getting pre-doctoral fellowships from NSF and the EPA.

Summary

The graduate program in the department of Zoology continues to be a very strong and thriving program in difficult financial times. The faculty and administration should be commended on their obvious efforts to maintain their high quality and excellent reputation and to make improvements in important areas suggested by the program review of 2001. In particular, the appointment of a Graduate Program Coordinator and the increase in graduate student stipends have addressed some of the most pressing concerns of the 2001 report. The Department has a policy of voting a new departmental chair every 3 years. Based on the 2001 graduate program review and this follow-up review, that appears to be a good model to follow to create a vigorous department that continues to change and improve.

GRADUATE COUNCIL MEETING

May 22, 2003

3:00pm, Kidder Hall 128

Present: Selker (acting chair), Bond, Ciuffetti, Fisk, Markle, Pedersen, Rettig, Sanchez, Strickroth, Watrous

Absent: Bird, Brauner, Collins, Feller, Francis, Gobeli

Guests: Sherman Bloomer, Denise Lach, Harold Parks, Michael Quinn, Steven Radosevich, John Westall

I. Approval of Council Minutes

The minutes of the May 8, 2003, meeting of the Graduate Council were approved as distributed.

II. Chemistry Graduate Program Review Report

The Graduate Council conducted a graduate program review of Chemistry on January 30, 2003. Elaine Pedersen (Health and Human Sciences), chair of the review team, highlighted the summary and recommendations in the review, giving high marks to John Westall and the Chemistry department for the valuable contributions this department makes to the university in spite of the difficult budget climate at Oregon State University. Recommendations for departmental consideration and action are listed below:

Graduate Teaching and Advising

A re-examination of required graduate coursework is suggested. Given size of the faculty related to the various traditional divisions of chemistry, the Department should consider reducing the total number of graduate courses that are offered. Although the courses needed for graduate students will vary according to sub-discipline, an effort should be made to have a common set of degree requirements, for example, the number of courses, research proposals, seminar presentations, cumulative examinations, and so forth.

Continue involvement in multidisciplinary and interdisciplinary programs. This offers graduate students the opportunity for additional coursework and an enhanced graduate and research experience.

As faculty members retire, discipline-specific graduate coursework should be re-examined to insure compatibility with research areas identified as important to the Department and the research specialties of the faculty.

To insure adequate graduate faculty for various divisions and research interest group areas it is critical that new hires be tenure track faculty to insure no further loss of graduate faculty and research capabilities.

Faculty and Research Programs

While two of the three hires made in the last five years are women, one is an individual of color; the total number of faculty that are women and individuals of color is low. The Department is encouraged to continue to search for qualified women faculty and people of color as new hires by identifying capable women and individuals of color as recruiting targets as part of their hiring process for the replacement of retiring faculty.

It is critical that start-up funding be available for recruiting new tenure track faculty as senior level faculty retire. Substantially higher start-up funding will probably be necessary to attract women and people of color.

Although current faculty are productive and successful in acquiring grant funds, the changing needs of industry, the failure to refill faculty positions, and the need to replace faculty who are soon to retire, place the research programs in potential jeopardy. If research programs are in jeopardy, so is the graduate program. It is critical the Department be allowed to continue to hire faculty and be provided adequate start-up funds to recruit strong faculty.

Graduate Students

To rectify the situation described above, the Department is considering a variety of initiatives. Some of the initiatives can be pursued with few new resources (Chemistry Self Study Report, 2002). The review committee supports these initiatives and recommends their implementation:

- Re-examination of required graduate coursework and restructuring of TA workloads.
- Continue to recruit international students.

Other initiatives would require additional resources, but it is clear if the Chemistry Graduate Program is to remain strong and keep its current status these actions will be necessary. The following are recommended:

- Hire more graduate faculty.
- Rehabilitate existing facilities and pursue construction of a new facility.
- Increase graduate stipends to stay competitive.
- Increase access to advising and faculty interaction during the graduate student's first year.
- Identify potential needs of incoming students and match applicant interests with faculty research.
- Provide opportunities for first-year students to learn more about each professor's research activities.

Facilities

While a thorough cleaning would help and an immediate major renovation will provide some relief, the Department badly needs a new facility. Postponement could result in

compromising a program of otherwise excellent quality. Therefore, the problems with the laboratory facilities must receive high priority.

As indicated in the 1989 report, the Department must address the safety/health issues of graduate student desk space located in laboratories.

Resolving the issue of funding for the three major shared instrument facilities (currently supported via internal and external funding sources) would be beneficial to the Department.

Administration

Given that most graduate students hold GTA and GRA appointments in the Department and the importance of these positions to the research and teaching missions, the Department might consider ways to increase graduate student involvement. For example, the Department might consider graduate student participation on the Long-range Planning Committee or other committees as appropriate. Graduate students offer perspectives and insights that can represent valuable contributions to the Department.

Other—Electrical and Machine Shops

The Department needs to locate sustainable funding to support shop needs particularly in the machine shop area.

John Westall, Chemistry Department chair, said that hoods meet exhaust standards but might not pass a federal inspection. Sherman Bloomer (Dean, College of Science) said that the building would probably not pass an inspection by the Occupational Safety and Health Administration (OSHA). Barbara Bond (Forestry) said that OSHA inspected Cordley Hall in the 1980's and required many changes. Barbara Watrous (Veterinary Medicine) reported that OSHA had inspected Vet Med recently. Westall reported that Chemistry departments across the country are reporting surprise spot-checks of their facilities by OSHA. Doug Markle (Agricultural Sciences), noting that the external reviewer detected odors in the Chemistry building that he had not smelled in many years, asked whether students or faculty were complaining of sickness or headaches. Westall responded in the affirmative. He reported that the third floor must be shut down on hot days because ether can boil in the laboratories. Bloomer said that Gilbert Hall is unfixable as a laboratory structure. The College of Science is looking into the possibility of moving the Chemistry Department into Linus Pauling Hall when it is built.

Bloomer told the Council that he is encouraging departments to rotate department chairs because he is "burning out some of my best people." Burnout is such a major problem that it overrides the cost of lost continuity when leadership changes within a department.

The situation with declining faculty numbers has become worse since the program review took place due to additional retirements declared in the last two months. Because money is not available to rebuild faculty numbers from state funds, funds must be found from other sources. Bloomer did not believe that the Departments of Chemistry and Physics could support faculty salaries with grant monies. According to Westall, faculty who obtain grants from the National Institute of Health have a greater ability to generate salary funds than those whose work is

supported by National Science Foundation funds. The major challenge in hiring new faculty is finding money to remodel and equip a laboratory (startup funds) for those faculty members. Westall reported that they lost two candidates to other institutions earlier this year; startup costs may have been part of the problem.

Chemistry has been very successful at modifying workloads as the composition of faculty FTE changed. Many of the 100-level course instructors are getting higher evaluations from their students than tenure-track professors. Although tenure-track faculty recognize the fixed-term faculty as valuable, fixed term faculty do not serve on the graduate faculty, with the exception of one or two who serve on specific graduate student advisory committees. Given that one-quarter of the faculty has retired since Thanksgiving, the department is being forced to make difficult staffing choices. The research level can be sustained, but traditional teaching areas might suffer from declining breadth. Five of the six people who have retired this year will continue to work in the department in some way. Asked whether collaboration with another department could fill some of the gaps in faculty resources, Westall said that several graduate students are working in collaboration with other departments and in other labs now. Asked whether the OSU 2007 planning would affect Chemistry, Bloomer said that the planning efforts such as those undertaken in Chemistry have been the source of the best thinking in OSU 2007. Chemistry serves as the foundation for a number of departments in the university.

The report was approved as presented.

III. Mathematics Graduate Program Review Report

On February 28, 2003, the Graduate Council and the Curriculum Council conducted a joint undergraduate and graduate program review. Michael Quinn (Computer Science), the Curriculum Council representative on the review team and co-chair of the review presented the report to the Graduate Council. The executive summary of the report is included in these minutes as follows:

Mathematics is central to any college or university, especially to one with strong science and engineering programs. Oregon State University must protect its interest in the Department of Mathematics. While the quality of the undergraduate program is good, the graduate program is clearly in decline. Further reductions in the number of graduate faculty members would accelerate that decline, with a significant ripple effect on the rest of the campus. Thousands of OSU students take service courses from the Department of Mathematics each year. These courses rely upon an adequate supply of high quality graduate students. With this concern in mind, we make the following recommendations to the Dean of Science and the Provost:

1. Establish 25 as the minimum number of graduate faculty in the Department of Mathematics. (This number would include Professor Robert Burton, who holds a full-time administrative position outside the Department.) Provide the Department with a budget enabling it to hire new graduate faculty members to reach this size.

2. Modernize the networking infrastructure within Kidder Hall.
3. Ensure the Department has a budget large enough to hire an adequate number of graduate teaching assistants to support its service-teaching mission.

Since 1990, the Department of Mathematics has suffered from flat or shrinking budgets. The general feeling among tenured faculty members is that the Department has absorbed more than its share of the pain as the College of Science has struggled to put its financial house in order. About one-third of the faculty members currently employed by the Department hold fixed-term appointments, but some faculty still have not accepted this new reality. Instead there is evidence the tenured faculty members are waiting for the situation to improve. While many of the Department's woes can be traced to inadequate budgets, other problems stem from inadequate internal processes. We encourage all of the faculty members in the Department to look for opportunities to solve problems under their control. We make the following recommendations to the Department of Mathematics:

1. Continue to simplify academic programs while maintaining core competencies.
2. Pursue innovative pedagogical strategies to maintain student opportunities while reducing the cost of providing them.
3. Eliminate from the catalog courses that have not been taught in the past three years.
4. Improve the computing infrastructure of the Department, probably by moving to commodity, Windows-based computers and providing remote access to a high-performance Unix system. Ensure instructors have PCs in their offices.
5. Improve the faculty governance process to ensure progress can be made solving problems under the control of the Department.
6. Create a handbook for instructors and provide regular opportunities for instructors to meet with the leadership of the Department.
7. Find new sources of funding. In particular, if there is to be a large capital campaign associated with OSU 2007, ensure that the centrality of the Department to the mission of the University and the Department's particular financial needs are well articulated.

Asked whether last-minute cancellation of classes is preventing students from completing their degrees in a timely manner, Harold Parks, chair of the Mathematics Department, said that core courses have not been cancelled. However, delay in scheduling electives has required some students to amend their graduate programs of study. According to Bloomer, the requirement that a minimum of eight students be enrolled in graduate courses was a university rule made years ago by Roy Arnold (Provost at that time). Mathematics has many problems meeting this threshold, but Bloomer said that, if the department can justify a small enrollment course, he would permit it.

The Council discussed concerns in the review report about the declining number of tenure-track faculty. Suggesting that Mathematics will never again have 30 tenure-track faculty members, Bloomer said that 25 faculty members is a reasonable number to use as a target.

Bloomer reported that he has secured funding for rewiring Kidder Hall, where the Mathematics is located. Negotiations are now taking place to reduce the variety of independent computer

systems in departments within the College of Science and to rely instead on a central server. Earlier efforts to improve computer systems by voluntary efforts at the department level have been replaced by a mandate for change. In response to an observation that graduate student access to computing could be enhanced through the purchase of inexpensive personal computers, Parks reported that their computer support person dislikes PCs and especially dislikes Microsoft products. Some faculty members consider the alternatives to their UNIX system unacceptable. Bloomer stated that the move to a central server will require shifting computer support decisions from departments to a central point.

Quinn reported that the number of required courses in the PhD curriculum was higher than at other schools. Lowering that number might address some problems associated with low course enrollment. Other suggestions from the review team include innovative teaching, using Web technology in courses, eliminating courses from the catalog that have not been taught in the last three years because “false advertising” was frustrating students, and more use of task forces to work on departmental issues.

The departmental faculty should have information ready that could support a capital campaign. Bloomer reported that he charged the department chairs this week to get their faculty on board to work on this.

A recent hiring search is bringing in a dual career couple with strong academic credentials and expectations for work in exciting new directions for Oregon State University. The department is very hopeful that this couple will be a strong draw for talented graduate students. The Council explored the difficulties in attracting top graduate students, noting that several faculty members have internationally distinguished reputations and welcoming personalities that should generate student loyalty and excitement. Parks said that several prominent professors left a few years ago and that national awareness of this had an impact on student perception of their program. Parks said that top students attracted to the West Coast would tend to choose the University of Washington (UW) over OSU. In response to questions from council members about why he thought that, he responded that UW is perceived to be a better school and Seattle to be a more interesting community than Corvallis.

Asked about the minimal discussion of diversity issues in the report, Quinn responded that diversity has not been an issue because of the difficulties of attracting any students and faculty. However, the most recent hire in the Mathematics Department was a woman.

In response to a suggestion that funding might be available if the department were to emphasize scholarly issues of mathematics pedagogy, a popular topic within the National Science Foundation, Parks said that this would take faculty away from their real research and emphasize areas that would not help a faculty member be promoted. Bloomer said mathematics education could lead to promotion if the research work was consistent with the faculty member’s position description. Bloomer has given up on expecting the state to fix these problems, but he has not given up on fixing the problems with other sources of funding.

Although the Graduate Council accepted the review report as presented, Council members concluded that the language expressing concern about departmental leadership was too subtle. Two issues were singled out as particularly problematic. First, the computer service support person is standing in the way of departmental progress in upgrading computer systems and software; he should be replaced. Second, the department chair needs to present a more positive image about the accomplishments and abilities of the current faculty. Alex Sanchez (Education) and John Selker (Engineering) will draft a letter summarizing the concerns of the Council. This letter will accompany the report as it is transmitted to the Provost.

IV. Category I Proposal for a Graduate Certificate in Sustainable Natural Resources

Denise Lach (Sociology) and Steven Radosevich (Forest Science) presented a Category I proposal. As stated in the proposal summary, “The proposed intensive twelve-week, 24-credit Graduate Certificate Program in Sustainable Natural Resources is designed to engage university instructors and scientists, and resource professionals in a process that integrates diverse approaches and perspectives to find workable solutions for complex natural resource issues of local, state, regional, national, or international importance. The Certificate Program is designed for mid-career agency, company, industry, or agency employees and others with at least two years professional experience beyond a Bachelor’s Degree in Arts, Humanities, or Science who want more training and experience to solve such problems. Courses in the Certificate Program will provide in-depth disciplinary knowledge in several natural resource disciplines, as well as cross-disciplinary thinking and problem solving.”

The certificate program will involve all new classes, which will be offered only through this certificate program. The courses will be tightly integrated rather than being taught independently. The program will span 14 weeks in total with 2 one-week breaks. Lach said that the program easily could be reduced to one that generates 18 credits.

Because the program schedule and budget came up consistently in liaison letters, Radosevich spoke to those points. Concern was voiced that students might not be able to survive such an intense program. Two 8-day breaks were added to the program so that students had some time to recover and have some leisure time. Asked whether a true graduate experience could be generated in the intensive time schedule proposed, Radosevich said that, although all the instructors are experienced graduate educators, the program would be more effective if a smaller number of credit hours were required. The time to complete a project is substantial toward the end of the term. Because some people could not complete it under these circumstances, the project could be completed in the following term or in absentia.

The program will be financed entirely by students’ tuition. During summer terms, 86% of tuition paid is returned to the departments offering the courses. The administrative cost is small, although more help may be needed with the admissions process. The admission materials include a statement of purpose, a description of the project, and transcripts. Radosevich was asked whether the efforts of the large number of faculty members involved would have a negative

effect on their research and on their service to other graduate students. He said that no one faculty member will teach for more than three weeks.

Plans are to offer the program for the first time in the summer of 2004, then repeat it for the second time during the summer of 2006. Even without any advertising, many inquiries have been received, suggesting that recruiting the number of students needed to cover the costs of the program should not be a problem. Radosevich and Lach have written a grant for scholarship aid, which should be helpful if the initial offering of the program does not attract a sufficient number of students. The program will be evaluated after two years to determine whether the enrollment goals have been reached.

Lach said that they had considered alternative schedules such as offering the program over successive summers. Their research identified the intensive summer model as the one most appropriate for mid-level professionals. Web-based courses were not considered because of the interactive nature of the classes.

The Graduate Council has been considering a change in the minimum number of credits required for a graduate certificate. Radosevich said that he had been a member of the Graduate Council when the graduate certificate guidelines had been approved. He did not recall any rationale for the 24-credit minimum except the use of that number by the University of Oregon. He and Lach would welcome a change in the required number of credits and said that his program, based on 18 credits of courses, would serve the needs of the students better than the currently proposed program. Council discussion of the challenges of offering the program for a full three months on a very time-intensive basis led some Council members to oppose the program as currently designed. These same Council members indicated that a less intensive program for 18 credits was more feasible and encouraged Radosevich and Lach to consider resubmitting a proposal that would address these concerns.

Council action on the proposal was postponed, but with the following comments to be sent to Radosevich: First, the Council members plan to review their background material on graduate certificates and will entertain a motion on June 12, 2003, to reduce the minimum number of credits required for a graduate certificate from 24 to 18. Second, Radosevich and Lach are requested to provide a revised proposal that is based on 18 credits of courses and that presumes that students will devote, on average, 540 hours to complete the program. This number follows the guidelines in the Curricular Procedures Handbook, which says that "One credit represents a total time commitment; in and out of class; of three hours each week in a 10-week term." If the Council approves the reduction from 24 to 18 in the number of credits required for a graduate certificate, it will entertain a motion to approve the revised certificate proposal from Radosevich and Lach. If it fails to approve that change, the Council will vote on the original proposal.

GRADUATE COUNCIL MEETING

May 8, 2003

3:00pm, Kerr Admin. Bldg. 650

Present: Brauner (chair), Feller, Fisk, Francis, Gobeli, Markle, Pedersen, Rettig, Selker, Strickroth

Absent: Bird, Bond, Ciuffetti, Collins, Sanchez, Watrous

I. Approval of Council Minutes

The minutes of the April 24, 2003, meeting of the Graduate Council were approved as distributed.

II. Science and Mathematics Education Follow-up Report

Steve Esbensen (Oceanic and Atmospheric Sciences) reported on a discussion that he and Claire Montgomery (Forest Resources) conducted with Larry Enochs, chair of the Department of Science and Mathematics Education (SMED) as a follow-up to the 2001 review of the SMED program. The full text of the report resulting from that visit follows:

Graduate Council Follow-Up Review Report Science and Mathematics Education Graduate Program 11 March 2003

On 4 March 2003, Professors Steve Esbensen (Oceanic and Atmospheric Sciences) and Claire Montgomery (Forest Resources) met with Professor Larry Enochs, Chair of the Science and Mathematics Education (SMED) department, to follow up on the Graduate Council's 2001 graduate program review. Professor Enochs and a senior SMED faculty member reviewed a draft of this follow-up report and provided additional comments and corrections of fact.

A major issue at the time of the 2001 review was the relationship of the SMED graduate program to the emerging education unit on campus. Other issues raised by the review were faculty communication with graduate students and the advising of new students; collegiality, communication and committee structures among faculty members; and new faculty hires and facilities. The reviewers find that significant progress has been made on the recommendations, but that the challenges and opportunities are much greater than those found at the time of the review.

Since the time of the Graduate Council review, one faculty member has resigned and two faculty members have turned in their retirement papers. This presents major personnel issues and opportunities that are discussed in more detail below. We note here, however,

that unless new hires occur, the SMED faculty will be reduced by half—from 6 at the time of the Graduate Council review to 3 when the retirements take effect in 2004.

Our report is organized by the responses to five questions that were posed to Professor Enochs at the follow-up review meeting. These are presented and discussed below. The committee's summary and recommendations can be found at the end of the report.

1. How is the School of Education initiative progressing from SMED's perspective?

The new education unit is in very early phases of development and its future is uncertain. SMED is actively involved in defining that future. Three issues were addressed in our discussion:

(a) Foundation classes: SMED views the new education unit as an exciting opportunity to strengthen graduate education research on campus. The Graduate Council review noted that essential courses in foundations of education, educational psychology and educational research are currently taught by the SMED faculty, at the expense of more topical courses that link science and math content to science and mathematics pedagogy. This problem could be solved by building a general education faculty in the School of Education having expertise befitting a Category I research university.

(b) Licensure: The very successful and high quality 5th year teacher licensure program in science and mathematics education, currently administered by SMED, is at risk due to the pending retirements of Profs. Niess and Erickson. Prof. Enochs and Dean Bloomer agree that the licensure program must change for the success and survival of the SMED graduate program. The new education unit presents an opportunity to transfer support for coordinating and administering the teacher licensure program to the School of Education, while the SMED faculty continues to play the major role in the science and mathematics education component of the licensure program.

(c) SMED's home: SMED continues to believe that its primary mission of research and graduate instruction in science and mathematics education is most likely to be successful within the College of Science for the reasons cited in the Graduate Committee Review Report at the time of the initial review. However, SMED intends to actively advise and, when appropriate, participate in School of Education initiatives at both the undergraduate and graduate level. In general, SMED is supportive of the concept of an undergraduate teaching "pathway" with international flavor that is being discussed as part of the School of Education proposal.

2. What is the current state of the faculty?

This is the most immediate of the new challenges faced by SMED. Since the Graduate Council review, one of the active faculty members has resigned (Lederman), and the two mathematics education experts on the faculty have turned in their retirement papers

(Erickson and Niess). The two pending retirees carry the bulk of the responsibility for administering the licensure program.

SMED views the personnel crisis as an exciting opportunity to hire the next generation of energetic and high quality educators in mathematics education. The reviewers applaud the faculty's resolve and optimism. The stakes are high, however. If SMED is unable to follow through with new hires or cannot obtain relief from the responsibilities of administering the teacher licensure program, it may be unable to sustain its prominent position as a nationally recognized leader in content-based math and science education. The College has, in the past, invested in this highly productive unit and, hopefully, will continue to do so. The University's development of a high quality general education program in the School of Education is also a key to SMED's future success.

Prof. Enochs reports that collegiality and communication among the faculty have improved significantly in the past two years. Morale is high. The five current faculty members have increased their efforts in seeking new grants to compensate for the loss of research income (\$538K in FY01 vs \$376K in FY02) that resulted primarily from the departure of Prof. Lederman. Seven proposals are currently under review and several others are being written. Another positive development is a more even distribution of high quality graduate students among the current faculty members.

Discussions are underway with a group of 5-6 researchers seeking courtesy faculty appointments to begin a graduate "free choice" education research program. This program would focus on education provided through museums or other institutions with an education component. An example would be research on optimizing educational opportunities at the Hatfield Marine Science Center.

3. What is SMED's current hiring strategy?

Hiring priorities have changed since the Graduate Council Review. At that time, the review committee suggested adding a faculty member in the area of college and university education. Now, with the pending retirements in the department, the area of mathematics education research has become the top priority and is crucial to the continued success of the department. Prof. Enochs identified two strategies: (a) using College of Science instructional funds from the two impending retirements to fund at least one mid-career mathematics education expert, or (b) using a combination of CoS instructional funds and SMED research buyouts to hire two new faculty members. The reviewers support the idea of recruiting a mid-career mathematics education research expert who could bring major grant support to OSU and "hit the ground running." SMED is a nationally recognized leader in science and mathematics education, and may be able to draw a top-quality mid-career candidate. In any case, the Dean and the Prof. Enochs are in agreement regarding the need to hire a mathematics educator. The reviewers feel that such a position should be opened at the first possible opportunity.

4. Are the SMED faculty and the College of Science dean in agreement with respect to the teacher licensure program?

Prof. Enochs reports that the Dean Bloomer and he now agree that the 5th year teacher licensure program must change to insure the success and survival of the SMED graduate program. The commitment to this high quality and popular program is unquestioned. The Dean supports the continuation of the Teachers in Residence program for the supervision of the preservice teachers participating in the licensure program. However, expansion of the licensure program within SMED appears to be no longer under consideration. The primary issue is the allocation of the cost and time involved in coordinating and administering the existing program. This must be addressed if the department is to achieve its primary objectives as a high quality research and graduate education program. There are many options for the teacher licensure program involving SMED and the School of Education. These options must be prioritized and developed as soon as possible, in conjunction with the OSU 2007 planning efforts.

5. What steps have been taken by the chair and faculty to improve communications and advising for incoming and continuing graduate students?

Prof. Enochs is very pleased with the progress that has been made in this area since the review. Despite the loss of an active graduate faculty member, the number of SMED graduate students is holding steady (74 registered students as of Summer 2000; 80 registered students as of Summer 2002). The faculty has recently reviewed and revised all course syllabi and has produced an advising document that clarifies graduate examination and research expectations. There are plans to put this information on the departmental web page, but it has not yet occurred. Given the large "off-campus" component of the graduate student population, we encourage the development of web-based communication as soon as possible.

As a result of the new advising materials and greater collegiality among faculty members, Prof. Enochs believes that the orientation of new graduate students has improved. The structure of graduate student orientation remains the same. The chair continues to meet with each doctoral student on arrival, and there is a general orientation meeting for all graduate students. Prof. Enochs believes that the effectiveness of the advising is much improved. One example of improvements offered by Prof. Enochs is related to international students. In the past, international students were at a considerable disadvantage in developing projects for a required graduate seminar. The expectations were not clear, and the opportunities for participating in externally funded research projects in fulfillment of these requirements were limited. Part of the problem was a long-standing assumption that international students could not be in Oregon classrooms to carry out their research projects. Occasionally students would feel obligated to make special trips to their home countries to carry out research for the seminar. These issues have now been addressed. The faculty is actively seeking to provide research opportunities on externally funded projects

and it is now explicitly recognized that international students can perform research in Oregon classrooms.

Other areas receiving attention since the review are continued efforts to expand the number of GTA opportunities outside SMED and a recent successful upgrade the hardware in the SMED graduate student computer laboratory. Teaching and advising off-campus students are a continuing challenge. The main effort in this area is a pilot program organized by Profs. Gummer and Flick to develop SMED capability for distance delivery of existing SMED courses and seminars.

Summary and recommendations

SMED remains a high quality graduate program, but the college and the university must move quickly to rebuild and strengthen the graduate mathematics education faculty that is disappearing next year due to retirements. We recommend at least one new hire in the area of mathematics education, effective no later than Fall 2004. The integrity of the department and its graduate program are at stake. Unless this hire occurs, SMED will have 3 faculty members by the end of the 2003-04 academic year, none of whom are experts in mathematics education. We also recommend either hiring a coordinator for the licensure program or developing a cooperative administrative arrangement with School of Education. If the latter course is pursued, SMED should retain curricular control of the science and mathematics component of the program. We continue to support the major recommendation of the 2001 Graduate Council review that SMED remain in the College of Science.

Significant progress has been made in terms of departmental collegiality, communication, and clarity of program objectives since the 2001 Graduate Council review. Prof. Enochs reports that course syllabi and graduate research and examination structures have been completely reviewed and revised. Related documentation and advising materials have not yet been completed. Prof. Enochs also reports a more even distribution of Ph.D. research and advising responsibilities across the faculty. We urge the chair and faculty to complete the implementation of the plans to improve graduate program documentation and advising as soon as possible for the benefit of all SMED graduate students.

<end of the report>

In response to a question about undergraduate education and changing pathways to licensure, Esbensen said that the SMED department planned to advise and participate as much as possible in the undergraduate licensure program. John Selker (Engineering) asked whether the Dean of the College of Science is committed to replacing the faculty needed by the program. Esbensen believed that the Dean had expressed support, but was not sure that he had directly stated that a faculty member would be hired. Options have been explored between the department and Dean Bloomer regarding this new hire.

The Graduate Council accepted the report as presented.

III. Graduate Level Learning

Open forums on graduate level learning were held on Thursday, April 17, 2003, and on Monday, April 21, 2003. In response to recommendations at these forums, the Graduate Council modified its policy on graduate level learning in three ways: 1) graduate-only credits will be calculated against the gross total credits on the program of study; 2) the number of blanket-numbered credits allowed on a master's degree program was increased from six to nine; and 3) the policy will be effective Fall 2005. In response to one other comment made at one of the two forums and at the request of the Graduate Council, the Graduate School conducted a survey of departments/programs to determine the impact of the policy. The results of the survey were discussed by the Council.

Handouts to the Council included 1) raw data consisting of narrative responses to the survey, 2) a one-page summary of points represented within the comments, and 3) a table summarizing the responses. Approximately 44% of the units with graduate programs (N = 35) responded. However, some of the responding departments did not answer the questions in the survey instrument, but did comment on the issues involved. Some departments appeared to not understand how to make the requested calculations. For example, the MS/MA examples given on the questionnaire suggested that 23 out of 45 graduate credits must be standalone graduate credits and noted that up to 12 credits of thesis or 6 credits of research, plus an additional 9 credits of blanket-numbered courses and an additional 6 credits of internship could count toward this 23. The question was how many new courses would be needed to complete the rest of the 23 required standalone credits. One unit indicated that 36 credits would have to be created to sustain the graduate program with this new policy and another indicated that 45 credits would have to be generated. These two responses suggest master's programs of much greater than 45 credits even though current program requirements do not suggest such high numbers.

One response that appeared more than once was, "What needs to be fixed?" On the other hand, other survey respondents argued that the policy did not go far enough and that it would lower the standards of graduate education at Oregon State. The most common concern, which previously had been expressed at the forums, related to the adequacy of faculty resources to comply with the policy. In addition to the concern about inability to offer graduate standalone courses, there were concerns that meeting that requirement would lead to a reduction in the number and variety of classes available to undergraduates. Interdisciplinary programs were identified as an area where compliance would be especially difficult.

Sally Francis (Graduate School) told the Council that she had shared plans to carry out the survey with the Provost's Council. She also shared a comment from the Dean of the College of Liberal Arts regarding a meeting of CLA department chairs. Dean Schaffer indicated that CLA is committed to graduate education and, at the same time, wants to maintain the high quality of undergraduate education at OSU; CLA chairs are struggling with how to maintain quality in both arenas, but not at the expense of one over the other. CLA Chairs and Directors are also

concerned about low enrollments when graduate courses are offered as standalone courses as compared to slash courses. Dean Schaffer indicated that CLA Chairs and Directors are appreciative of the Graduate Council's changes to the graduate level learning policies, including moving the starting date forward to Fall, 2005, increasing the limit on blanket-numbered courses from 6 to 9, and including thesis hours and capstone courses, etc., in the total credits against which the 50% would be calculated. She will appoint a CLA task force that will work on a plan to try to phase in these proposed changes by Fall, 2005.

Bruce Rettig (Graduate School) reported on the history of slash courses at OSU. In the late 1980s, the State Board of Higher Education decided that all public universities in Oregon should convert from the quarter system to the early semester system, which is the predominate calendar in higher education in the United States. After an extended planning period and with new catalogs ready to print and distribute, this decision was rescinded. Academic units, which had spent many hours examining their curricula, were encouraged to keep as much of the new ideas as possible rather than simply moving back to their old curricula. At the same time, the state system adopted a new course numbering system, which included the option for each university to use a new slash numbering system. However, in most cases, the slash courses that appeared in the new catalogs appeared to be simple replacements for 4XXG (undergraduate courses that could be accepted for a graduate major) and 4XXg (undergraduate courses that could be accepted for a graduate minor but not a graduate major) courses. Many of the units that currently have only slash courses and no standalone courses (other than blanket numbers) had no 5XX courses prior to that curriculum change.

David Brauner (Liberal Arts), noting that the original version of the 50% policy adopted in November triggered much anger, especially in Liberal Arts, suggested that many responses to the survey showed more confusion than anger. Brauner said that the message from Schaffer is quite positive, reflecting the gratitude of CLA administrators for the additional time to comply with the policy and additional leeway to find ways to make changes in curricula.

The next step appears to be a joint meeting between the Graduate Council and the Faculty Senate Executive Committee.

Selker noted that one serious issue identified at the forums was the difficulty of compliance for some specialized graduate programs (for example, a one year master's program in Forest Engineering). He suggested the need for a process to deal with special cases. Brauner said that the idea of exceptions was discussed at the last Graduate Council meeting. Selker would like to see, as a part of the communication of the policy to the campus, that the Graduate School could grant exceptions in certain cases. Selker also would like to see some group identify opportunities for service courses (e.g., statistics) that would become standalone graduate courses. Because one logical group to do this would be the Graduate Council, he suggested that it should take an active role. Brauner said that the task force to be created in Liberal Arts will also be looking at the same issue. He also observed that the Graduate Council would have almost two years to work with groups that come up with creative new ideas to comply with the policy. Doug Markle (Agricultural Sciences) and Elaine Pedersen (Health and Human Sciences) discussed planning

efforts in Health and Human Sciences to develop courses that would meet the needs of the entire college for statistics courses geared to their shared research needs.

Francis supported the development of a procedure for granting exceptions. Selker explained that he is interested in an appeal process for an entire department and argued that criteria for exceptions should be publicized at the same time that the policy is explained. Francis noted that all policies at Oregon State University are open to appeal. Although an explicit statement is not necessary, it could be added. When an accreditation team asks how exceptions are made to policies, they are looking for a defensible rationale and general, although not absolutely universal, compliance.

Selker suggested that Associate Dean Rettig could craft a procedure for exceptions based on the information from past Council deliberations including today's meeting. He also suggested creation of a subcommittee of the Graduate Council. That group would address the issues of communication to departments and improvement of service level courses. Francis said that undertaking the coordination of courses such as the variety of statistics courses on campus would be a challenging task and might be beyond the available time of this group. Markle suggested adding a sentence stating: "Appeals within the spirit of the policy should be directed to the Graduate School."

Because the bottom line is what students tell accreditation teams and other reviewers, Fisk argued that changes that meet the expectations of the students should meet the spirit of the policy. Brauner said that setting up criteria assumes that we might know in advance what the departments might need in the way of exceptions. Rettig said that students need to be a part of the exception process, so that student opinions of the graduate level learning are heard. Fisk suggested that graduate student evaluations of slash courses be an important way to assess whether exceptions to the policy should be granted. Brauner said that those who are passionate about their programs would fight to make sure that they will "survive" this policy requirement.

Explaining the full policy to departments and how it can be implemented could be the responsibility of either the Graduate School or the Graduate Council. Selker asked whether the Council was going to take this opportunity to argue for changes in courses offered by the Statistics Department. Rettig reported enrollment statistics for Spring 2003 registration in ST 412/512 and ST 413/513. In both of those courses, many more graduate students are enrolled than undergraduates. Fisk asked whether this might imply that the courses are viewed by graduate students as graduate level learning and whether this would be a basis for an exception. Or should these courses be converted to standalone graduate courses?

Renee Windsor (Graduate School) was asked to contact Vickie Nunnemaker, who provides staff support for the Faculty Senate Executive Committee, to tell her that the Council has conducted and discussed feedback from departments. Whether and when a joint meeting between the Graduate Council and the Faculty Senate Executive Committee will be left to the Faculty Senate Executive Committee to determine.

IV. Graduate Certificates

Rettig reported that three Category I proposals to establish graduate certificates have been submitted to Academic Affairs for preliminary review. All preparers would like to have their proposals reviewed by the Graduate Council this term. The three proposal preparers are hoping to discuss both approval of the proposal and the number of credits needed for the certificate. Those Category I certificate programs are (1) Sustainable Natural Resources, submitted by Steven Radosevich in the College of Forestry, (2) Advanced Instructional Practices, submitted by Juanita Lamley in the School of Education, and (3) Teaching English to Speakers of Other Languages (TESOL), submitted by Don Prickel, School of Education.

Several faculty members considering preparing graduate certificate proposals are interested in learning whether the Graduate Council would consider reducing the number of credits required for a graduate certificate from the current 24 credits to some lower number, such as the 15 minimum credits required at Portland State University and the University of Washington. Radosevich is particularly interested in that question as are the deans.

Selker asked about the allowance for transfer credits. Rettig answered that the fraction of allowed transfer credits is the same ($1/3$) as it is for a 45-credit master's degree ($1/3$) of the credits. If the number of credits were reduced from 24 to 18, the number of transfer credits needs to fall from 8 to 6. If the number of credits were reduced to 15, the number of transfer credits should be limited to 5. Markle asked whether 18 credits is an appropriate number for a certificate to be fully earned in one term (Radosevich wishes his certificate program to be completed during Summer term). Rettig noted that registration over 12 in summer may be feasible given the intensive nature of the Sustainable Natural Resources program, which includes field trips and work done on weekends. Selker asked whether any accreditation issues were involved. Rettig said there were not. Mary Strickroth (Graduate School) noted that the lack of questions about the number of credits in earlier discussions may reflect the lack of experience with certificate programs at Oregon State University. Brauner asked whether, if the Council holds to the 24-credit minimum, proposals would include requests for an exception to the number of credits required. Rettig argued that this would not be an issue. The minimum credits would be analogous to the minimum of 45 credits for a master's degree, for which no exceptions are ever allowed. Selker, believing that the point of a certificate is to show mastery, asked what minimum number of credits would demonstrate that mastery. Selker said he would be comfortable with 18 credits if they are in the area of the student's background, but 24 credits would be needed if it were in an area outside of the student's background.

Because the Council lacked a quorum at this stage of the meeting, no action was taken. However, Council members encouraged Radosevich to present his proposal and to explain how it would be modified if he could reduce the number of credits from 24 to 18.

V. End of Year Issues and Summer Category II Reviews

Rettig briefly explained that the Council needs to address two end-of-the-year issues. First, how will Category II proposals be reviewed during the summer? A committee could work on the proposals over the summer if all or some of the current members are available or if replacements can be identified. One summer, the Council delegated the responsibility to the Associate Dean for the period during which the Council would not be meeting. These and other options need to be discussed. Second, how will the minutes from June 12 be approved? Last year, that was handled by emailing the minutes to committee members, asking for changes and, once a reasonable time for changes passed, they were declared to be approved.

GRADUATE COUNCIL MEETING

April 24, 2003

3:00pm, Kerr Admin. Bldg. 650

Present: Bird, Brauner (chair), Ciuffetti, Collins, Feller, Francis, Gobeli, Markle, Pedersen, Rettig, Sanchez, Strickroth

Absent: Bond, Fisk, Selker, Watrous

I. Approval of Council Minutes

The minutes of the April 10, 2003, meeting of the Graduate Council were approved as distributed.

II. Graduate Level Learning

The Graduate Council held open faculty forums to discuss graduate level learning proposals on April 17, 2003, and again on Monday, April 21, 2003. The purpose of the open forums was to solicit input from Graduate Faculty to inform the Graduate Council as it affirmed or revised (1) the “50% rule” (minimum of 50% of all graduate credits [excluding capstone activities such as thesis, research in lieu of thesis, and internship] on graduate programs of study must be stand-alone graduate courses, (2) criteria for differentiating the 500 component of slash courses, and (3) possible inclusion of a few 400 level credits on graduate programs of study.

People invited to the forum were provided a three-point rationale. First, concerns had been identified during Graduate Council program reviews. Of 15 Graduate Council Program Reviews conducted between fall, 1999, and spring, 2002, 11 mentioned the issue of slash courses. Generally, graduate students report disappointment with the graduate quality and rigor of slash courses particularly when enrollment in such courses consists of a large majority of undergraduate students. Second, in its final report (6/12/01), the Task Force on Graduate Level Learning recommended that the numbering system be redefined to eliminate the “slash” model and that 6-12 credits of non-blanket 400 level credits be permitted on a graduate program of study. Third, the report of the evaluation committee of the Northwest Association of Schools, Colleges and Universities (April, 2001) included the following as its recommendation #7: “Even though a Graduate School policy exists that articulates intended quantitative and qualitative distinctions in expectations for undergraduate and graduate students enrolled in combined 400/500 level courses, students and faculty from a variety of programs indicate that these courses frequently fail to adhere to those distinctions. In such cases, these bi-level courses appear not to constitute genuine graduate level educational experiences. Therefore, the Committee recommends that the University conduct a thorough analysis and evaluation of all bi-level courses and syllabi and then take appropriate steps to guarantee compliance with the requirement that a minimum of 50% of all courses in a student’s graduate program be genuine graduate-level experiences, as articulated in Standard 2.F.4.” Accreditation Standard 2.F.4 states, in part: “Graduation requirements for advanced degrees offered by the institution are determined by the faculty teaching in the applicable graduate

programs. At minimum, the policies governing these graduation requirements include: ...the minimum number of graduate-level credits, normally at least 50% of those required for the degree....”

Those attending the forum were told that the 50% rule would apply to students entering Fall 2004 or thereafter, that the Council had adopted a slash course differentiation policy, and that the possibility of 400 level courses was still under consideration.

The recently adopted slash differentiation policy reads as follows:

Expectations for Graduate-Level Teaching and Differentiation between Undergraduate and Graduate Components of “Slash” Courses

It is expected that all courses at OSU, both at the graduate and undergraduate level, will be designed around well-defined objectives or student learning outcomes. Instructional opportunities should be designed to help students achieve these outcomes. Student learning outcomes encompass the range of student attributes and abilities that students should be able to demonstrate after successful completion of the course.

The primary distinction between undergraduate and graduate courses should be in the *quality* of learning outcomes as opposed to the quantity of work. Given the range of subject matter taught at Oregon State University, it is impossible to establish a single standard for graduate-level teaching. However, for many courses, Bloom’s taxonomy (Bloom, 1956; also see appendix 1) provides a useful basis for determining the quality of cognitive learning outcomes. These are (from lowest to highest-order), 1. knowledge, 2. comprehension, 3. application, 4. analysis, 5. synthesis, 6. evaluation.

Learning outcomes in undergraduate courses are likely to focus primarily (although not exclusively!) on *knowledge*, *comprehension* and *application*; learning outcomes in most graduate courses, including the graduate component of 400/500 dual listed courses should primarily emphasize *analysis*, *synthesis* and *evaluation*. Where these learning outcomes categories are not appropriate, instructors should develop comparable categories.

Expectations for learning outcomes in the graduate component of dual listed (400/500 level) courses are the same as for stand-alone 500-level courses. In syllabi and course proposals, a distinction should be made between learning outcomes for students taking the course for undergraduate credit (400 level) and those taking the course for graduate credit (500 level). In most cases this distinction should include emphasis on developing skills in analysis, synthesis, and/or evaluation for the 500-level credit, as opposed to, or in addition to, acquisition of knowledge, comprehension and application of information, which are more characteristic of undergraduate curricula. The different student learning outcomes should be accompanied by appropriate differences in instructional opportunities and evaluation procedures.

David Brauner (Liberal Arts) distributed email and letter responses to the issue of graduate level learning and slash courses. Lynda Ciuffetti (Science) said that she sent an email to all the chairs and associate chairs in the College of Science asking them to send email responses to Brauner. The email messages that were distributed came from Steve Esbensen, John Ringle, Roger Nielsen, and Don Armstrong. Brauner noted that the messages reflect the lines of discussion that the Graduate Council has pursued itself over the past several months both in terms of concerns about the policy and reasons for implementing change.

Elaine Pedersen (Health and Human Sciences) asked about the feasibility of one suggestion made at the forum—to offer the 500 component of a course with one more credit than the 400 component to reflect the additional class meetings and work undertaken by an instructor in a slash course. Sally Francis (Graduate School) reported on a conversation with Leslie Burns. Francis understood from that discussion that the two components are considered two separate courses. Consequently, if one was to be worth three credits and the other four credits, this change could be made using a Category II proposal.

Bruce Rettig (Graduate School) said that, in response to a Graduate Council recommendation a year ago to eliminate the slash model, the Curriculum Council had asked whether 400 and 500 courses could meet in the same room at the same time. If so, what would be the value gained from eliminating slash courses? Robert Burton had suggested at the Thursday forum that this and other questions indicated that the Curriculum Council had assumed that the two bodies would continue to explore that policy change (elimination of slash courses). Brauner said that if the conversation returns to the option of splitting slash courses, which had been recommended by two people who had submitted email comments, resolution of this issue would take another year. He assumed that another Graduate Council would have to start over again from square one.

Brauner noted that several people at one forum suggested that the 50% rule would cause the elimination of some graduate programs on campus. Those raising this concern argued that, if any programs are to be eliminated, this should come through a university-wide planning process and not through actions such as the one taken by the Graduate Council. Brauner said that the Council had never intended by its action to weed out weak graduate programs. He added that there seemed to be many misconceptions including what the 50% rule was. Brauner noted that slash courses are not being eliminated. The few stand-alone courses that would need to be created would not be a drain on departments. David Gobeli (Business) and Brauner both noted that they had presented the Graduate Council policies to their departments and those departments had no problems with the idea.

Alex Sanchez (Education) reported that one person at one of the forums said that the English Department has not been able to recruit some top prospective graduate students because those students note the the lack of stand-alone courses, both by observing the OSU web site and by talking to current graduate students.

Pedersen asked whether it would be possible to adopt the Graduate Council policies, but allow those departments that lack stand-alone courses to phase into the policy later. Brauner pointed out that there are already some measures under consideration to make it easier to make a

transition, including increasing the number of blanket hours on programs and increasing the number of slash courses permitted.

Doug Markle (Agricultural Sciences) said he understood one suggestion to be that a minimum number of stand-alone courses be required rather than setting a specific percentage of all credits for the degree. Percentages in some departments would call for four to five courses as stand-alone, while in other departments/programs, the 50% rule could be satisfied with only two credits of regular non-blanket stand-alone coursework. Francis pointed to the accreditation standard (2F4) “including the minimum number of graduate level classes, which is normally 50% of the total.” Francis suggested that if a minimum number of stand-alone credits were established, it could then be reported to the accreditation team that two stand-alone courses are now required, the criteria for graduate level learning experience has been revised and that the Graduate Council would continuously monitor syllabi of slash courses. Markle suggested student evaluation forms to be used for all 500 level courses, not just the slash courses.

Ciuffetti recalled that this discussion was motivated by two goals: 1) to respond to the concerns stated by the accreditation team and 2) to satisfy students who are unhappy with the slash courses as they now stand. She supported the suggestion to increase thesis or blanket hours. She also supported the concept of allowing extra credit for the graduate students in a slash course when the professor meets alone with graduate students to make sure they have a true graduate level experience. The example given was for four hours of credit for a course with three contact hours with undergraduates and graduate students plus an additional class meeting involving the professor meeting with only the graduate students. Francis suggested that for the sake of ease and clarity, graduate students could register for one credit of 507 instead of making slash courses three credits for the undergraduates and four credits for the graduate students.

Wendé Feller (Student) said that an instructor in a slash course told her that undergraduate students who cannot gain entrance to some 400-level courses with capped enrollment are attempting to get into the class by registering for the 500 level of the course. Rettig reported being contacted by an instructor facing this problem. He advised the instructor to work with the Registrar to block enrollment in the 500-level course and allow students to enroll in that component only with the permission of the instructor.

Sanchez concluded that the costs for instructors, undergraduates and graduate students of the 400/500 system has become so large and complicated that they exceed the benefits reaped by the program. Brauner said that the door to revisit the elimination of slash courses was opened by Bob Burton at the forum reporting that the Curriculum Council would be open to discussion of this issue. Last year the Graduate Council proposed that the slash course system be eliminated, but that 18 credits of 400 level course work be allowed on a graduate program. The units that are upset now with the 50% rule would be even more upset with the elimination of the slash system because they would have to come up with even more stand-alone graduate courses. Francis noted that a majority of the expressions of concern have come from the College of Liberal Arts. For example, a majority of those attending the Thursday forum and all except one person at the Monday forum were faculty in the College of Liberal Arts.

Sanchez suggested that the long-range goal should be to eliminate slash courses, but that colleges need time to proceed to develop stand-alone graduate courses. Pedersen noted that several people stated that eliminating slash courses would negatively impact Baccalaureate Core courses. For example, a faculty member from Women Studies suggested that, if they had to choose either graduate or undergraduate offerings, they might elect graduate level courses. Women Studies, which makes a significant contribution toward undergraduate Baccalaureate Core needs, would be placed in a very difficult position.

Sanchez reiterated that the Council should listen to the graduate students' concerns about slash courses. Ciuffetti asked whether the studies carried out by the Graduate Level Learning Task Force distinguished between master's students who were unsatisfied with slash courses and doctoral students. Francis reported that roughly 5% more masters' students were dissatisfied with slash courses.

Markle, said that, although the Graduate Council would like to eliminate slash courses, the 50% rule serves as a reasonable transition because of increasing the number of allowable blanket hours and including capstone completely as part of the calculation of stand-alone credits; the Council needs to adopt those measures today. Brauner read the current "50% rule", which subtracts the credits used as a capstone before estimating the number of allowable slash credits.

Sanchez suggested a joint meeting with the Curriculum Council to discuss the long-term future of slash courses. He said that individual departments must be involved in making these changes and the Graduate Council cannot legislate departmental planning.

Markle asked how graduate advisory committees would know which courses are slash and which are not. Rettig suggested that instructors of stand-alone courses provide documentation for students to use to prove which courses are stand-alone. Work load will be increased in Graduate School for program of study evaluations because all courses would need to be checked to see whether they are slash or stand-alone. Ciuffetti asked whether "extra credit" (the one credit of 505 or 507 added to slash courses as discussed earlier in the meeting) would count as stand-alone hours. Pedersen reported that the Department of Apparel, Interiors, Housing and Merchandising is already providing opportunities for students in slash courses to enroll in those one-credit courses, although doing this is currently an elective option for students. By registering for the additional credit, the instructor's academic department would receive credit for the work their faculty member is doing and for the enhanced learning experiences that students receive. Under the university's budget model, all work carried out deserves appropriate recognition. Markle said that many faculty members and students might be shocked to discover that an extra hour is tied into slash courses. Gobeli said that these changes are not helpful in eliminating slash courses in the future.

Pedersen wondered if it would be advantageous to make formal adjustments to the policy before meeting with the Faculty Senate Executive Committee. Gobeli suggested that another task that could be useful preparation for meeting with that committee would be to conduct more research on how other universities treat this problem.

The following motion was approved unanimously.

- Change the 50% rule from “Minimum 50% of all graduate credits (excluding capstone activities such as thesis, research in lieu of thesis, and internship) on graduate programs of study must be stand-alone graduate courses. The remaining credits may be the 500 component of 400/500 slash courses.” to “Minimum 50% of all graduate credits on graduate programs of study must be stand-alone graduate courses. The remaining credits may be the 500 component of 400/500 slash courses.”

Markle suggested changing the percentage to credit hour numbers, so that departments would be encouraged to offer more stand-alone courses. He suggested that 50% should be considered a goal rather than an absolute requirement and that the way to achieve this goal is to require two stand-alone graduate level courses. Rettig noted that some programs do not want to have more than six thesis hours on programs of study. Yet some of these departments also do not want to or cannot offer more stand-alone graduate courses.

Francis wondered whether it would be easier for programs to comply with the policy if the target date of implementation were moved out to three years from now. This would provide ample transition time and reduce the need to monitor how departments meet the new requirement. Francis understands that Dean Schaffer’s single concern regarding this policy is timing. Department chairs have reported to Schaffer that they can do this, but that more time is needed. Pedersen asked whether Schaffer indicated how much time would be needed. Francis seemed to think that two to three years of additional time to implement the policy would be acceptable. Francis also urged that everyone should comply on the time schedule and the policy should go into effect fully for all students at a specific time, as opposed to “grandfathering” some students, which has proven to be a very difficult problem for the two-year transition for continuous enrollment. Brauner reported that the Geosciences Department told him that two years would be an appropriate time period to use for phasing in this policy.

The following two motions were approved unanimously.

- Implement the 50% policy, as approved today, to any program of study submitted Fall 2005 or thereafter.
- Raise the maximum number of blanket credits from 6 to 9 on a 45-credit masters’ degree program effective Fall 2005.

Brauner said that policies adopted today will be reported to the Faculty Senate Executive Committee and discussed with that group at a meeting in May.

Francis said that the College of Liberal Arts appears to be the source of the largest number of departments that may have a problem meeting this policy currently. Although some departments have several stand-alone graduate courses, it still would be difficult to determine the impact, because not all those stand-alone courses might be elected by every student in the department. Don Armstrong, during the Thursday forum and again in his email to the Graduate Council,

suggested that research be done to determine how the policy change would impact each department. Rettig suggested that this be done through an internal audit by each department to study the impact of this policy on their curriculum. He asked council members whether they wanted the impact analysis to be carried out through a survey conducted by the Graduate School before the meeting with the Executive Council. Ciuffetti asked whether the survey would be based on the modified 50% rule. She suggested a question such as “Based on the curriculum you have, what additional classes would you need to create to comply with this policy?” The consensus of the Graduate Council was that this survey should be done. Mary Strickroth (Graduate School) pointed out that the increase in blanket hour numbers made today will not affect the Master of Arts in Interdisciplinary Studies students because the maximum blanket hours for that degree is already nine. The survey to study the impact of this policy may discover a substantial difference between departments regarding this policy, because departments have used the combination of lecture courses, seminars, research, and other learning activities quite differently.

Appendix 1. Explanation of the 6 levels of cognitive competency in Bloom’s Taxonomy*

Competence	Skills Demonstrated
<p>Knowledge of terminology; specific facts; ways and means of dealing with specifics (conventions, trends and sequences, classifications and categories, criteria, methodology); universals and abstractions in a field (principles and generalizations, theories and structures):</p> <p>Knowledge is (here) defined as the remembering (recalling) of appropriate, previously learned information.</p>	<ul style="list-style-type: none"> • observation and recall of information • knowledge of dates, events, places • knowledge of major ideas • mastery of subject matter • <i>Question Cues:</i> list, define, tell, describe, identify, show, label, collect, examine, tabulate, quote, name, who, when, where, etc.
<p>Comprehension; grasping (understanding) the meaning of informational materials.</p>	<ul style="list-style-type: none"> • understanding information • grasp meaning • translate knowledge into new context • interpret facts, compare, contrast • order, group, infer causes • predict consequences • <i>Question Cues:</i> summarize, describe, interpret, contrast, predict, associate, distinguish, estimate, differentiate, discuss, extend

GRADUATE COUNCIL MEETING

April 10, 2003

3:00pm, Kerr Admin. Bldg. 650

Present: Ciuffetti, Collins, Feller, Fisk, Francis, Gobeli, Markle, Rettig, Sanchez, Selker, Strickroth, Watrous

Absent: Bird, Brauner, Bond, Pedersen

Guests: Joseph Krause, Juan Trujillo, Kay Schaffer

I. Approval of Council Minutes

The minutes of the March 13, 2003, meeting of the Graduate Council were approved as distributed.

II. Proposal for the MA Degree in Contemporary Hispanic Studies

A proposal to create the degree of Master of Arts in Contemporary Hispanic Studies was introduced by Joseph Krause, chair of the Department of Foreign Languages and Literature. The proposal document, the result of a long and careful process, has been revised many times since it was first drafted two years ago. The proposed program is based on programs in other universities, including the University of Maryland, Baltimore County. A conference organized in 1999 on undocumented workers served as a catalyst for initiatives to create this proposal, as did the department's appreciation of the importance of demographic shifts toward a larger Hispanic community in Oregon. The program is unique within the United States, and perhaps internationally. The proposed degree, which was described as interdisciplinary in nature, was based on cultural studies in the larger sense of that term. It includes several nontraditional learning strategies including a learning community, new assessment methods, a presentation of a portfolio, and participation in a specific field experience designed to link students to the Hispanic community. The department anticipates that the proposal will increase the number of graduate teaching assistants in the department, freeing up faculty members to teach more graduate and undergraduate courses. The department intends to offer more slash courses and two to three additional stand-alone graduate-level courses. Students pursuing this degree could work in social work areas, labor organizing, law enforcement, and other occupations. The anticipated start date is either Fall 2004 or Fall 2005.

In response to a question from Barbara Watrous (Veterinary Medicine), Juan Trujillo (Foreign Languages and Literature) said that the maximum number of students at the beginning of the program would be eight, although six students are anticipated to matriculate the first term that the program begins. This number should be large enough to support the stand-alone graduate courses because those courses would also appeal to MAIS and MAT students who are currently involved in the department. Watrous also noted that one source of funding was of limited duration and would not provide continuing funds for a continuing faculty position. Kay Schaffer,

Dean of the College of Liberal Arts, said that the College was ready to fill in the financial gaps that would be created by the limits of that funding.

Responding to a question from Sally Francis (Graduate School), Krauss said that the six teaching assistantships described in the proposal are in addition to the number of current teaching assistants. Their plan to replace some of the instructors in first and second year Spanish classes with teaching assistants is expected to generate revenue savings. Noting that those six assistants are not listed in the budget, Francis asked how that is accounted for in the budget. John Selker (Engineering) said that he knows an instructor in the department who is teaching five courses a year and receiving a base salary of \$24,000. He argued that the strategy of replacing instructors with teaching assistants would be more costly in the long run. He also said that undergraduates are currently having a difficult time getting into sections of courses. Although he finds the proposal to be laudable, he is concerned about the current status of the undergraduate program. Krauss said that in addition to the faculty salaries, which range from \$24,000 to \$48,000, faculty salaries require additional funds for OPE.

Graduate teaching assistants in Foreign Languages and Literature are only allowed to teach two courses a term. Even carrying a full graduate course load, assistants will be able to teach six courses per year. Lynda Ciuffetti (Science) asked for clarification of the difference between courses and sections. Trujillo explained that the first and second year courses in Spanish are divided into multiple sections, with each assigned a separate instructor. Graduate assistants would either teach two sections of a particular course such as Spanish 113 or one section of, for example, Spanish 113 and one section of Spanish 213. Because graduate assistants can teach these courses, more graduate courses could be added without hiring additional faculty members.

Doug Markle (Agricultural Sciences) asked how the projected four new stand-alone graduate courses could be started with the resources now available to the department. Krauss replied that the department expects the resources to expand because of this new program. Selker asked Schaffer what, given the financial challenge facing the undergraduate program, the College of Liberal Arts can do to appropriately fund this program. Does the college expect the increased FTE to be available from current funding? Schaffer said that the College wants to keep moving forward even while funding is scarce. The department has an agreement with the college to be as flexible as possible in providing resources out of funds available to the college. In response to continuing questions on this issue, Schaffer said that a new faculty member could be expected in the program in its second year at the earliest, although it is possible that the additional hire would not take place until the fourth year. Krauss believed that two new courses per term would be adequate to maintain the undergraduate program and start the new graduate program. These new courses can be added without jeopardizing the quality of the undergraduate program. Those new courses would represent .50 FTE. The department can meet that obligation with current faculty resources. If a part-time instructor could be hired to cover some areas, a tenure-track faculty member could be freed to teach graduate courses.

David Gobeli (Business) asked whether the interdisciplinary nature of the program is really a focus of the program, as stated in the proposal. He suggested that statements about economics as

a part of the degree are stated but left hanging in the proposal, especially where the junction of this program and the College of Business are concerned. Francis asked whether the creation of a minor in Intercultural Studies is a part of the proposal or whether this is a description of courses intended to complete an integrated minor. In response to Selker's request for clarification of the faculty FTE, Krauss explained what courses and sections are currently taught by faculty. Francis asked whether one person would be directing internships or whether major professors would be expected to supervise internships as well. Selker reiterated his concern about the heavy workload of the current faculty and his concern about whether the department has the resources to initiate this program.

Martin Fisk (Oceanic and Atmospheric Sciences) asked how this program differs from the MAIS, which is also interdisciplinary and allows a non-thesis option. Francis said that the two degree credentials are quite different.

Selker again expressed his view that the degree program is an excellent idea, but that he was concerned about the workload. Francis suggested that the concerns about faculty resources fall into two categories: Would addition of a graduate program without additional resources damage the undergraduate program? Would lack of resources impair the quality of the graduate level learning experience in the new program? Selker said that he would not be comfortable with approving this proposal without clarifying these issues and suggested that the proposal be sent back with a request for a stronger statement of support from the dean of Liberal Arts. The additional faculty member should be hired at the beginning of the program, not in the fourth year when there is no additional workload. Gobeli asked whether there are any groups that might support this program by providing additional financial support. Where is the university currently moving (with OSU 2007) with the topic of outside funding?

Council members raised additional questions: Should the integrated minor focus on intercultural communication or intercultural studies? Can other cultures be added to this degree or is the focus simply Spanish? Selker mentioned that he would support a minor in intercultural studies. Mary Strickroth (Graduate School) asked for clarification of whether the capstone was a thesis or a non-thesis option because the proposal refers to 3 credits of thesis (the MA requires either a thesis with a minimum of six credits or a project with a minimum of three credits).

The Council requested that Associate Dean Rettig draft a letter to the department requesting a revision of the Category I proposal that addresses the following areas of concern identified by the Graduate Council:

- § Revise the budget to address the question of adequate FTE and clarify the budget line item concerning GTAs.
- § Examine the list of courses in the integrated minor and consider adding courses that provide a large-scale perspective such as might come from courses in economics or additional courses in political science.

- § Clarify the language defining the capstone experience. Specifically, is the capstone a thesis option, which would require 6-12 credits, or a non-thesis option, which would include 3-6 credits of research-in-lieu-of-thesis (commonly research or project credits)?

III. Graduate Certificates (numbers of credits)

Two years ago the Graduate Council approved policy guidelines for new graduate certificate programs, which require a minimum of 24 credits. No certificate programs have been created, although a few proposals are in preparation. Some units interested in graduate certificates have asked that the minimum number of credits be lowered, perhaps to 15 (the minimum at Portland State University) or 18. Francis asked Council members to visit with faculty in their colleges to discover the views in their units on this issue. Because many council members were unaware of the graduate certificate credential, background information will be distributed prior to this issue being fully discussed.

IV. Graduate Level Learning

The Graduate Council discussed comments made by Bruce Sorte, President of the Faculty Senate, at the April meeting of that body regarding further discussion of the 50% rule and slash courses. Ciuffetti interpreted Sorte's comments to imply that Graduate Council members were expected to meet with faculty in their colleges to gather information before providing the Faculty Senate with recommendations. In parallel, the Executive Committee will entertain questions and comments regarding the continuation of masters' degrees in departments where that degree is based primarily on slash courses. Ciuffetti quoted Sorte as saying, "We will jointly be working with the Council to try to get a proposal that you would accept." Francis understood that Sorte was telling senators that Graduate Council members would be meeting with Faculty Senate members (constituents in represented colleges) to discuss graduate level learning and the continuation of slash courses.

Francis reported on a phone conversation with Stella Coakley, president elect of the Faculty Senate. She said that she understood Coakley to say that she thought that the bottom line was that the Graduate Council's action on slash courses was probably right, but that prior to taking that action, each Graduate Council member did not consult with their college. Coakley said that follow-through would now be entirely in the hands of the Graduate Council, and it is the Council's responsibility to find out the impact of this Council decision on University units. Also, a meeting involving members of the Graduate Council and the Faculty Senate Executive Committee is expected.

Fisk suggested that to frame communication between members of the Graduate Council and faculty within their colleges, Council members should say *what* the Council decided. They should also say *why* it was decided (slash courses are not graduate level) and explain that there are still two other parts to the subject which have not been decided: graduate level outcomes and undergraduate level learning. Then ask for input on the remaining two issues. Fisk recommended development of a one-page description of what was decided, why, and what is left to decide.

The Council then had an extensive discussion of alternative ways to engage graduate faculty members on campus. After listening to constituents, Council members might discover that the policy needs to be modified. Fisk suggested that the Graduate Council should invite the Faculty Senate Executive Committee and other interested parties to a Graduate Council meeting and spend one hour on 50% rule. Gobeli suggested that the information page be emailed to constituents. As a result of this discussion, the following plan was approved:

- \$ Schedule two open forums in a large room in the Memorial Union for two dates in April
- \$ Write a one page description of the decision and how it was made including issues that are not yet resolved
- \$ Insure that as many Council members as possible attend the meetings
- \$ Compile email responses
- \$ Hold a joint meeting between the Faculty Senate Executive Committee and the Graduate Council following the open forums.

GRADUATE COUNCIL MEETING

March 13, 2003

3:00pm, Kerr Admin. Bldg. 650

Present: Brauner (Chair), Bird, Bond, Ciuffetti, Feller, Fisk, Francis, Markle, Pedersen, Prucha, Rettig, Sanchez, Selker, Watrous

Absent: Collins, Gobeli

Guests: Sunil Khanna, Kay Schaffer, Nancy Rosenberger

I. Approval of Council Minutes

The minutes of the February 27, 2003, meeting of the Graduate Council were approved as corrected.

II. Proposal for the PhD Degree in Community Impact Anthropology

Nancy Rosenberger (Anthropology) introduced a proposal to initiate a new instructional program leading to the PhD in Community Impact Anthropology. As stated in the proposal, this is a response “to the increased demand for applied anthropologists capable of conducting on-the-ground ethnographic studies relevant to local communities and key societal institutions domestically and internationally. From corporations to hospitals, watershed councils, tribes, development agencies or state and local governments, people in institutions increasingly realize that to serve their various constituencies effectively, they must have a deep understanding of the perspectives, institutions, communities with whom they interact.”

All three areas of concentration—local values, indigenous knowledge, and environment; ethnicity, culture, and health; and business, organization, and work—are interdisciplinary. Professor Deanna Kingston, herself a King Island Inupiak Eskimo, provides unique insights and leadership in the first area. Professor Chunhwei Chi in Public Health will provide important contributions to students working in the second area. Professor Gregg Walker in Speech Communication will provide much help in understanding aspects of negotiation. Professor James McAlexander in the College of Business and Professor Sam Stern in the School of Education will also provide important contributions to the program.

Anthropology core courses are being shifted to the 500 level from their current slash (400/500) offerings. This enrichment of graduate courses will improve the educational opportunities for Master of Arts students. Doctoral students will be required to take methods courses, both qualitative and quantitative, as well as a core course in gender and ethnicity. To insure that students’ perspectives are not limited to domestic issues, students will include study of a geographic region as well as a competency in foreign language comparable to the OSU requirement for a BA degree. “As part of the comprehensive review, students will first develop annotated bibliographies and comprehensive papers in three areas: anthropological theories

relevant to community impact anthropology, interdisciplinary concentration, and PhD proposal.” Students must also “participate in term-long full-time residency program by selecting and collaboratively working with an external research supervisor in the area of their specific interests.” This residency experience could become the basis for the dissertation, although students could also select another area of research for the dissertation. Budget constraints and constraints on faculty time require that the department ease into the PhD program slowly. Four students would be admitted in the first year (expected to be 2005) with the number rising to eight new students in 2008. Faculty FTE also would grow slowly.

Sunil Khanna (Anthropology) explained that the proposal was heavily influenced by information received in his department about trends in the anthropology profession. It reflects both what is expected in the skills of graduates by peers and prospective employers and the expertise of the current faculty. Kay Schaffer, Dean of the College of Liberal Arts pointed out that liaison with the anthropology faculty at University of Oregon has uncovered support for the OSU proposal. She also expressed her support for increasing faculty FTE in Anthropology as laid out in the proposal. John Selker (Engineering) said that he learned during the review of the MA in applied anthropology that one person left the program last year and that several retirements are expected soon. Given this loss of faculty, will CLA replace them? Schaffer said that she supported replacing the upcoming retirements with new faculty in addition to the expanded FTE.

Bruce Rettig (Graduate School), observing that the proposal included a 500/600 slash course, said that this type of course is not needed because doctoral students are able to take 500 level courses and use them on their programs of study. Rosenberger asked if the Curriculum Council would have a problem with 500/600 slash courses. Rettig said that those kinds of courses have not been approved in the past because they were deemed unnecessary.

Barbara Bond (Forestry) asked about the expectations for research and teaching in faculty assignments. In particular, where does the department anticipate funding coming from, since most of the faculty effort (FTE) will be assigned to instruction rather than research? Rosenberger said that, because PhD students would be eligible for some grants that master’s students cannot receive, funding is expected to increase. David Brauner (Liberal Arts) said that the department has been successful in the past at securing grants. He foresees even more opportunity for grant funding in the future with a PhD program.

Doug Markle (Agricultural Sciences) asked about the FTE of the graduate coordinator for the program, suggesting that 0.50 FTE assigned to this task seemed high. Rosenberger said that a current faculty member would have this position in addition to regular responsibilities. Also, that coordinator would work with a newly formed board of advisors and would work with that board to establish internships for students.

Markle also asked how the undergraduate teaching load would change with the new departmental educational focus. Rosenberger said that graduate teaching assistants are expected to play an expanded role, including teaching several of the undergraduate courses. For example, the graduate teaching assistants for Anthropology 110 and Anthropology 210 would be the sole

instructors. PhD students could also direct discussion groups in other larger anthropology undergraduate courses.

Alex Sanchez (Education) asked about the impact of the PhD program on the master's programs. Specifically, would this affect the employment prospects for master's students? Has there been consideration of phasing out the MA program? Rosenberger said that students with master's degrees receive lower level positions in agencies than students with PhD degrees. Allowing the master's degree students to complete the new PhD would help graduates obtain higher-paying jobs with greater opportunities for career advancement. The MA in applied anthropology would not be phased out, but participation in the Master of Arts in Interdisciplinary Studies with students selecting two fields in anthropology would be phased out. Brauner said that an increasing amount of faculty time would need to be devoted to doctoral students; these new commitments would require at least some of the faculty to change the nature of their interaction with master's degree students. Selker asked about registration numbers for courses in Anthropology as the doctoral program is phased in. How viable do you expect the new 500 level courses to be with a smaller number of master's students? Rosenberger said that the numbers of students would be sufficient to support stand-alone graduate courses. One course in each area of focus will be a stand-alone graduate course. Rosenberger acknowledged that this change will create a new demand for faculty time but believed that the department could handle it.

Markle asked whether opportunities existed to share faculty resources and talents between OSU faculty and the faculty at the University of Oregon. Khanna said that faculty might be invited to participate in the OSU program, but that students are not likely to make extensive use of courses at the University of Oregon. Brauner did say that the historic preservation program at the University of Oregon has attracted some students from OSU; this is a precedent for the two schools working together.

Barbara Watrous (Veterinary Medicine) asked about the letter from Sociology, which expressed some concerns with the program. Khanna said that the Anthropology Department chair has spoken with the chair of Sociology. Rosenberger said that some sociology professors are considering participating in this program. She added that one issue emerging from the OSU 2007 planning effort is to facilitate work across departmental lines.

Selker asked for a table that would describe the undergraduate, masters and PhD programs and show how the department faculty members are going to supply the teaching FTE that is needed, especially given an expanded emphasis on research. Rosenberger said that the faculty is well aware of the need for increased FTE. Classes should be adequately staffed, but some of the other supervisory issues as well as adequate mentoring, which is needed with doctoral students, could present major challenges. Selker, explaining that his concern is that the FTE appears to be insufficient, argued that the college should make it a priority to fund this program.

Responding to Sanchez's observation that the library assessment concluded that resources are inadequate for the program, Schaffer observed that the proposal earmarked \$6,000 per year for new acquisitions. After Khanna suggested that the Internet is a rich source of information for

anthropologists, Selker said that, during the review of the MA program, few student offices were equipped with Internet connections. Rosenberger reported that grants for upgrading computers are being vigorously pursued. Martin Fisk (Oceanic and Atmospheric Sciences) asked whether any other space or facility requirements might present problems. Brauner said that remodeling is beginning on facilities used by the Anthropology Department. Space for offices does not seem to be a problem, but the facilities do need to be upgraded. Selker suggested that money be identified for development of graduate office facilities.

Bond supported the proposal, arguing that the appropriate way to add doctoral programs to the College of Liberal Arts is to begin with the strongest departments. Fisk was concerned that the amount of faculty resources (FTE) may not be sufficient to support the addition of a doctoral program. Lynda Ciuffetti (Science) agreed that funding must be provided at an appropriate level. Selker asked whether the Council wished to request a letter from Dean Schaffer that would provide a written record of her statement to the Council that the College of Liberal Arts is prepared to redirect funds to the new program. Sally Francis (Graduate School) and Ciuffetti also asked about the graduate teaching and research assistants; they were concerned that funding shown in the budget would not be sufficient to support those positions. Fisk asked how the funding level in the proposal would allow for the launch of the PhD program if no new faculty area added until 2005. In response to Bond's observation about the impact on undergraduate courses of redirecting faculty resources, Sanchez suggested that undergraduate courses might improve in quality if PhD students teach courses, rather than relying as heavily on videotapes as is done now. Recalling concerns raised in liaison letters from units such as Public Health, Markle asked whether the new program duplicated effort now under way in other programs. Elaine Pedersen (Health and Human Sciences) suggested that Public Health was focusing on domestic issues while Anthropology would emphasize international health issues.

Selker would like to see a chart showing more information about FTE. Bond asked what the purpose of that chart might be. Selker said that it could provide an opportunity for the department to seek more funding for faculty FTE from Dean Schaffer. Bond said she would prefer to send a letter to the dean with a strong recommendation that she seek resources that would increase the FTE in the proposal. Francis restated that argument as a concern on the part of the Graduate Council that the resources may not be adequate to fund the program. Selker said that the department should press for more resources at this stage of the planning process, rather than seeking more resources after the program is approved. He suggested that the departmental FTE is possibly adequate but minimal and he would strongly encourage the department and the college to find more funding for faculty FTE. Selker said that his position was based on the concern of the Council's team that reviewed the MA program; that group was concerned about the viability of an expanded graduate program given the amount of FTE in the department.

A motion was offered to send a letter to the Anthropology Department with a copy to Dean Kay Schaffer voicing a concern about the number of faculty FTE needed to support this program. That letter should include a recommendation to create a strategic plan for allocation of FTE, with the expectation that this analysis would reveal the need to hire faculty at an earlier point in the program. The motion passed with an amendment to include approval of the Category I proposal

and a commendation to the department for its thorough research and vision in building on its strengths.

The Council then adopted a motion to request that the Graduate School send the letter on their behalf to the chair of the Anthropology Department and to ask the Curriculum Council to delay their action on the proposal until the department receives the letter and provides a response, which could be attached to the proposal as it moves forward.

III. Conditional Admission

Among the recommendations submitted to Dean Francis from the Task Force on Graduate Admissions Standard on May 26, 2002, were the following:

4. The restrictions currently imposed on the ability of conditionally admitted students to hold graduate assistantships, to meet formally with their program committees, and to file graduate programs, should be eliminated.

The Task Force recognizes the value of conditional and provisional categories of admission, but the restrictions placed on graduate students admitted conditionally appear to complicate the lives and programs of such students to little useful purpose. The current policy/practice of the Graduate Admissions Committee, using provisional admission (with standard provisions) as an alternative to conditional admission, accomplishes the same end and has eased many of the problems previously encountered. However, this approach seems unnecessarily complicated and may change with the composition of the Admissions Committee. With the proposed modification, maintaining a distinction between conditional admissions (with conditions imposed by the Graduate Admission Committee) and provisional admissions (with provisions imposed by the graduate program) would continue to have merit.

5. With the recommended change in the restrictions on conditionally admitted students, the primary function of conditional admission would be to ensure that these students are tracked and receive appropriate attention. Therefore, graduate programs should be required to carefully monitor and report on the progress of these students after completion of their first term (12 credits) of work and quarterly thereafter until conditional status is removed.

Students admitted to graduate study with conditional status are likely to be at higher risk than students admitted with regular status. Requiring written reports from the programs that have appealed to admit these students might serve to facilitate better tracking of the success of these students as well as encouraging greater attention to mentoring. To be effective, an assessment of progress should occur as early in the student's program as is meaningful, presumably immediately after grades are available for the equivalent of one-term of work.

The Council approved a motion to adopt the two changes (first, to remove restrictions on offering assistantships and filing programs of study for conditionally admitted students and,

second, to require quarterly reporting on progress) with an amendment that *conditionally admitted* be changed to *academically conditionally admitted*. Karyn Bird (Chair, Graduate Admissions Committee) voiced her gratitude to the Council for their action on these recommendations.

IV. Graduate Level Learning

Near the end of the Faculty Senate meeting on March 6, 2003, that body approved the following motion, which had been offered by Bill Lunch, Senator, Liberal Arts: "I move to... refer the proposed change in graduate education to require that fifty percent of all credits be taken in graduate-only seminars or courses to the appropriate committees and councils of the Faculty Senate for review and consideration, leading to a recommendation to the Executive Committee and ultimately, to a decision by the full Senate." Graduate Council members who attended that meeting raised concerns about the authority of the Council to approve the changes in conditional admission or any other policy without those actions requiring referral to the Faculty Senate.

Francis said that the Graduate Council historically has been the final authority on issues of graduate education policy. Although the Council has the authority to make these decisions, it is a committee of the Faculty Senate. A major reason that the issue came before the Senate was that communication of the Council's policy change had been delayed by the desire to consider issues related to the 50% rule (criteria for the 500 component of slash courses and whether any 400 level courses would be allowed on a program of study) before explaining the entire set of changes to the campus community.

Francis summarized some of the conversations that have taken place since the Faculty Senate meeting. Bill Lunch has confirmed that his motion was intended to refer future action on this issue to the Executive Committee of the Faculty Senate. She talked with Bruce Sorte, President of the Faculty Senate, who outlined two parallel tracks for future action: First, let the Faculty Senate Executive Committee know where the Council is going regarding remaining actions affecting slash courses and related policy issues. Second, ask the Graduate Council members to check with constituents regarding this policy.

Several Graduate Council members expressed concern with these requests. Selker agreed that the Graduate Council does have homework to do. Namely, they should communicate the decision and the history of the decision to the university, preferably in a workshop setting. Brauner said that the fact that adoption of the 50% rule and delay of communication while working on related issues has caused misunderstanding about the timing and nature of actions needed to comply with the policy. In some cases, this appears to have led to a sense of panic. Chairs of three CLA departments sent a letter to Brauner expressing deep concern and requesting either a change in the policy or, at least, a delay in its implementation. Ciuffetti asked whether, if this policy is not changed and that is communicated to the Executive Committee and if the Faculty Senate subsequently votes against the policy, will the policy be changed?

Francis distributed part of the accreditation standards, drawing attention to Standard 2.F. Graduate Records and Academic Credit, which includes the requirement that “Graduate program faculty are involved in specifying admission criteria, transfer of graduate credit, and graduation requirements.” She emphasized one section in particular, which reads:

2.F.4 Graduation requirements for advanced degrees offered by the institution are determined by the faculty teaching in the applicable graduate programs. At minimum, the policies governing these graduation requirements include: the specified time period in which the degree must be completed; the number of credit hours that must be completed at the degree-granting institution, normally at least two-thirds of those required for the degree; the minimum number of graduate-level credits, normally at least 50% of those required for the degree; for the master’s degree, a minimum of one academic year of full-time study or its equivalent, with a minimum of 24 semester or 36 quarter hours; the number of graded credit hours that must be earned for the degree; the minimum standard of performance or acceptable grade point average, normally a B or its equivalent; the types of qualifying and exit examinations which the candidate must pass; the proficiency requirements the candidate must satisfy; and the thesis, dissertation, writing, or research requirement which the candidate must satisfy.

Francis noted that the Graduate Council is the only Faculty Senate body composed of graduate faculty members and the only Senate body representative of every academic college. She added that its representative nature adds a responsibility for the Council members to communicate with and get feedback from constituencies. Markle asked whether the referral under discussion was the second time policies involving slash courses had been referred back from the Faculty Senate. Francis said that the previous Graduate Council policy decision had been retracted when the Curriculum Council chose not to support the elimination of the 400/500 level slash course system because of its impact on undergraduate education.

GRADUATE COUNCIL MEETING

February 27, 2003

3:00pm, Kerr Admin. Bldg. 650

Present: Brauner (Chair), Bird, Bond, Ciuffetti, Collins, Feller, Fisk, Francis, Gobeli, Pedersen, Prucha, Rettig, Selker, Watrous

Absent: Markle, Sanchez

Guests: Sunil Khanna, Kay Schaffer, Courtland Smith, and John Young

I. Approval of Council Minutes

The minutes of the February 13, 2003, meeting of the Graduate Council were approved as submitted.

II. Geosciences Review Follow-Up Report

On April 23, 2001, the Graduate Council conducted a program review of the Geology and Geography graduate degree programs. On January 29, 2003, Courtland Smith, the chair of the 2001 review, and David Gobeli (Business), a current member of the Graduate Council conducted a follow-up review. Smith presented their report, which (as amended by the Council) follows.

Summary of Findings:

The Department of Geosciences took the review very seriously and made progress on all the recommendations in the April 23, 2001 graduate and undergraduate program review. The actions taken by the Department were positive and have already begun to enhance capabilities.

Review of Primary Recommendations:

1. Additional tenure-track faculty is needed to maintain the Department's mission.

Using College FTE, diversity hires, and creative appointments for research faculty, the Department has increased tenure-track FTE. The Department's experience in the area of added FTE is instructive. When the review was done, the Department was contemplating hiring an instructor to handle part of the undergraduate teaching load. Applicants for the instructor position were well below department standards, and the instructor search was abandoned. The Department decided to search for a tenure-track faculty who would have a reduced research load and a higher teaching load. The applicants were outstanding and the Department hired an innovative teacher, who also has 0.20 research in the job description. With the tenure-track position, the Department achieved better quality teaching, better class coverage, and some research at only a slightly higher salary than the salary for an instructor.

Along with concern about the number of tenure-track faculty, the Department was also having trouble with the quality of part-time fill-in positions. Students were complaining about the quality of teaching. The Department solved this problem by developing a pool of research faculty interested in occasional part-time teaching assignments.

2. Computing facilities need better supervision.

The College of Science improved the situation by creating a college network and support staff. Internally, the Department changed its arrangement with COAS on use of the computer workstation classroom (Wilkinson 210). The room has had a hardware and software upgrade. Further, rather than being used once or twice a term, the room gets over 36 hours per week of use. The use is projected to increase above the 36-hour level, and the department has created a viable staffing plan for the improved facility.

3. Seek additional opportunities for joint Geography/Geology curricular programming.

Three integrative activities have been undertaken. First, the Department is submitting a Category I proposal for a BS in Earth Sciences. The degree has four options—Earth System Science, Earth Science Education, Public Interpretation, and Applied Earth Science. Second, the Department created an integrated seminar. This seminar has been very popular across campus. It takes a special topic each year—volcanology (2001), paleoclimate (2002), disturbance and cataclysms (2003). Third, several of the basic courses have opportunities for “cross-teaching.” These are courses that can be taught by either a geographer or geologist. Ten courses have this feature. One of the findings from the “cross-teaching” is that student interaction with faculty helps students select their major. The department has continued to have geographers and geologists on many graduate committees. Geographers and geologists cooperate on research.

Review of Secondary Recommendations:

1. Improve advertising of employment and internship opportunities to undergraduates.

The solution here is quite innovative. The Department did two things. First, it created a Board of Advisors who discuss career opportunities and provide networking for graduating students. Second, the Department has encouraged students to do a better job marketing themselves with improved resume writing skills that are learned in a seminar, GEO 407: From Student to Professional. The seminar addresses the job-opportunities question, plus many other professional issues.

2. Explore graduate course offering opportunities.

The problem solved itself with larger sections. Since the low enrolling courses were more often in geology, an increase in geology majors solved the problem. Reasons for the increase in majors are many. This increase is the opposite of what is happening in the

discipline. One reason appears to be new faculty and the cross-teaching of core courses, which brings geologists in more contact with potential majors.

The course offering issue is related to a faculty load problem, in which geographers were carrying a heavier teaching load. With a faculty load policy that each member of the faculty can expect to teach a large university service course, a course for majors, a course in their specialty, and a course for graduate students, the teaching load has evened out. The department has increased its teaching productivity at an average rate of 5% per year from 1989 to 2002

3. Examine accounting of geosciences majors.

Recent change in the Environmental Science Program has eliminated the geosciences option in favor of a geosciences undergraduate minor. With the minor, the Department gets credit for its teaching effort in this area.

Barbara Bond (Forestry) asked if the department had previously appointed tenure-track faculty with small research FTE and high teaching FTE. Smith said that the standard practice in Geosciences has been appointments with 50% research and 50% teaching appointments, although the newest appointment is 80% research and 20% teaching including commitments to work with graduate students. Bond was concerned about the difficulty of the new faculty member to move through the tenure process with a much lower research percentage. Smith acknowledged that the follow-up review team was more concerned with the quality of the program than with the situation of one faculty member. This concern for program quality affected their evaluation of this new hiring practice. Smith also reported that current Interim Chair Matzke will be going on sabbatical and doing fund-raising for the department as part of his sabbatical. The positive results identified in the follow-up review were, in Smith's judgment, proof of the success that can come from review procedures. Bruce Rettig (Graduate School) noted the excellent quality of the work that Courtland Smith did as the chair of the review team. The report of the Geosciences follow-up reviewers was approved with one change to clarify that the change in Environmental Science and the departmental minor referred to undergraduate degree programs.

III. Criteria for Approving New Graduate Courses

The Graduate Council continued its discussion from February 13, 2003, of guidance for graduate level courses. (See <http://oregonstate.edu/dept/senate/committees/gradcncl/min/20030213.pdf>). In response to a question from Barbara Watrous (Veterinary Medicine) about who determines or defines the assessment of learning, Bond answered that individual instructors are responsible for determining the learning outcomes for courses. She added that graduate students have been complaining of a lack of graduate level courses, saying that slash courses do not provide a graduate level learning experience. What graduate students are missing in slash courses is the academic rigor and the experiential component of meeting and networking with other graduate students. She suggested that Graduate School could post the guidelines established by this proposal on its web site so that instructors of slash and graduate level courses could learn what the Council's

expectations are for identifiable course outcomes.

According to Lynda Ciuffetti (Science), a mentoring committee in Botany and Plant Pathology meets regularly to guide instructors in best practices. Although supportive of the ideal that all courses be accountable to the same standards, she argued that university faculty would spend too much time trying to meet the criteria of the proposal under consideration by the Council. David Brauner (Liberal Arts) said that the examination of learning outcomes is already taking place for courses in Anthropology.

John Selker (Engineering) asked whether the committee submitting the proposed change had looked at ways to measure the differences between undergraduate and graduate courses, especially ways to compare outcomes with expectations. Bond said that they had not proposed quantitative measures. Because teaching is also an art, which cannot easily be quantified, outcomes are very difficult to measure. Selker would like to see some measure that would quantify the outcomes for student and instructor. He added that, at Oregon State, graduate students are not encouraged to sit in on courses before registering. Rather, they are expected to complete a course once they begin it.

Sally Francis (Graduate School) said that this proposal would create a tool to help faculty remember that they have two levels of students in a slash course and that they must provide a genuine graduate learning experience for those registered for the 500 level courses. Bond reiterated the importance of relating learning experiences in the syllabus to course objectives and learning outcomes. Francis recommended that instructors provide two syllabi, one for undergraduates and one for graduate students.

Ciuffetti summarized the background for this conversation: Graduate students had expressed concerns about their learning experiences during program reviews and the University accreditation process. When the Graduate Council selected the elimination of the slash courses as the best way to address their concerns, this action was not supported at the Curriculum Council. Given that decision, the Council's committee that evaluates new graduate courses was frustrated with the lack of clear criteria to make decisions. Is the proposal from that committee the appropriate way of dealing with the issue? Should the committee begin with this proposal and revisit these guidelines several months later to determine whether it resolves the problem? She added that care must be taken in imposing too much work for graduate students for the same amount of credit. Selker said that the faculty must bear the responsibility of insuring that graduate level learning is achieved.

Selker argued that quantitative language, which could be inserted into the proposed guidelines easily, would be very helpful to the faculty. Ciuffetti noted the difficulty of quantifying an experience as a "graduate level learning experience". The criterion for a 500 level slash course should not be different from that of a stand-alone graduate level course. Bond volunteered to reword the guidelines to refer to criteria for all graduate level courses. Selker proposed adding the word *significant* to the proposal to read, "All graduate level courses should include significant emphasis on developing skills in analysis, synthesis and/or evaluation...." This would also apply

to the 500-level component of 400/500 level courses. Bond argued that expectations for a 500 level course should be the same whether it is a component of a slash course or a stand-alone graduate course. Brauner asked whether students are complaining about difference between 500 and 600 level courses. Gobeli suggested starting with slash courses and then, at a later date, develop policy guidance for all graduate level courses. Selker wondered whether some courses at the graduate level are more fact-based than others.

Ciuffetti reported a conversation with Gordon Matzke, the interim chair of the Geosciences Department. Matzke was concerned about the Council's policy limiting the use of slash courses because many teaching assignments for 2003-2004 have been made and copy for the 2003-2004 catalog, including the schedule of classes, has already been submitted. He was concerned about implementing a policy change without sufficient advance notice to departments.

IV. Applied Anthropology Review Report

Martin Fisk (Oceanic and Atmospheric Sciences), who chaired the Graduate Council review of the Master of Arts in Applied Anthropology, presented the report of the review team. Their conclusions and recommendations follow:

Conclusions and Recommendations

The Master of Arts in Applied Anthropology degree program appears strong. It attracts and graduates many top students who find employment in their fields. The faculty attracts a moderate number of research grants and produce scholarly work.

Weaknesses to be addressed are identified in our Key Recommendations below. Attention to the Additional Recommendations could bring the MAAA program to a top ranked program. The committee feels that a Ph.D. program is feasible, but certain steps need to be taken first. Some of these are in our list of Key Recommendations and some are in the section Recommendations for Ph.D. program.

Key Recommendations

Fixed term staff

The department must establish the credentials of instructors of graduate courses by providing the Graduate School and the Graduate Council with these credentials, and obtaining approval for them to teach graduate level courses. The department should maintain current resumes of these teaching staff.

Program of Study - Curriculum

Multiple level courses 3xx/4xx/5xx should be eliminated immediately regardless of actions taken by the Graduate Council in this matter.

Reduce the number of required courses, especially in the World Culture series, to provide faculty more time for research and other scholarly activities.

Program of Study - Thesis

The magnitude of student debt should be reduced. Two actions are suggested to do this. The faculty should be more proactive with grantsmanship to help provide greater financial support for students. Faculty should actively manage and monitor student progress, in concert with the continuous enrollment policy, to reduce the post coursework lag in degree completion.

Thesis topics should be selected by the end of the third term, and coursework or seminars should be provided to facilitate this.

Administration

Develop a departmental governance system.

Students need to be involved in planning of curriculum, hiring, admissions, recruiting and other departmental business, where their voice would add value to faculty decisions.

Clarify the role of courtesy, adjunct, and extension faculty in the department.

Facilities

Upgrade student facilities with Internet access and telephones.

Find a venue to promote the department with displays of current work and material of anthropologic interest.

Additional Recommendations

Program of Study - Curriculum

Stage more courses over a two-year cycle to allow separation of graduate and undergraduate courses.

Courses in contemporary poverty, project management, and thesis selection should be considered for addition to the curriculum once the number of graduate world culture courses is reduced.

Program of Study - Thesis

Determine the impact of the new continuous enrollment policy on the time to completion and percent completion of MAAA degrees and identify stratagems to mitigate negative effects.

Recommendations for Ph.D.

The faculty should develop a strategic plan for establishing a Ph.D. program to include:

- A staffing plan to fill the growth needs and replace retiring faculty.
- A draft curriculum that fulfills the needs of the M.A. and Ph.D. programs.
- Establish greater national recognition for its graduate-level programs by increasing the level of grant funding and refereed and peer-validated scholarship.
- A plan for improved facilities.

- A plan for reducing student debt.
- A departmental management plan

John Young, chair of the Anthropology Department, said that the review was fair and that the recommendations from the team will be useful as the department proceeds with its proposal to establish a PhD degree. He was pleased with the external reviewers' enthusiasm for the quality of the department and the reviewers' respect for its national reputation. Relative to other OSU CLA departments, research funding is very high. Seven fixed-term faculty teach courses when regular faculty are not available. One fixed-term faculty member is playing a continuing role in the department until funding becomes available to hire a tenure-track faculty member with that person's expertise. The courses offered at the 300/400/500 level, mostly World Culture classes, are being eliminated. Concerns about the lengthy completion time by some students are being addressed. Because some students took the maximum seven years allowed to complete a master's degree, Young believes a more accurate estimate of average time to completion will require additional research of student records. The lack of graduate student participation on departmental committees reflects the active engagement of students in social settings. The department had problems with graduate student participation on committees, because they did not fulfill their responsibilities when they were on those committees. Graduate students are asked to informally comment on departmental decisions. Office staff members are often the ones who receive and communicate students' complaints and complements. More money is being provided to the department for remodeling of classrooms and telephone/computer connections. Because the department is located near Kerr Library, which has good computer facilities, adding departmental computers for students has not been a focus of attention in the department.

Responding to Ciuffetti's question about whether the department compiles data that could be used to measure time to degree, Young said that no question on the Graduate School's student survey generated that data. Ciuffetti suggested that the Anthropology Department could draw on experience in other departments, which provide a variety of models for student organizations.

Selker, observing that he had been a member of the review team, asked Young to comment on the major obstacles that the review team foresaw in the proposal to establish a PhD degree program. Noting that several of the recommendations impact both the graduate and undergraduate anthropology degree programs, Young said that the department is working to intelligently reallocate funding from undergraduate courses to graduate courses to support the creation of a PhD degree program. According to Selker, graduate students commented several times that undergraduates were holding slash courses back. Following up on Young's statement that the Anthropology Department's research funding exceeds that of other OSU CLA units, Fisk asked about the funding level of anthropology PhD-granting departments. Young replied that research funding would expand in the presence of PhD students. Sunil Khanna (Anthropology) noted that much funding for anthropological research comes from a specific source in NSF, which funds PhD students but not students pursuing master's degrees. The department has been successful in securing funding for many master's students through scholarships and private funding, but having PhD degree authority will open up more funding opportunities. In response to Selker's observation that master's degree students are submitting few articles to peer-reviewed

publications, Young said that the PhD degree would radically change the nature of publications by students and faculty.

After Selker asked whether Young disagreed with points made in the report, Young shared a listing of committees and explained how decisions are made in the department. He also took exception to a statement about a lack of reviews, saying that annual reviews take place each year. This appeared to be a case of incomplete communication because the concern in the review report was for the apparent lack of informal peer reviews of teaching. Post-tenure reviews have taken place for two faculty members, and the department is gearing up to conduct full five-year reviews for others.

Ciuffetti asked why the department did not have a graduate studies committee. According to Young, the committee that has been drafting the PhD degree proposal will evolve into this committee. Presently, the entire faculty decides on admission of graduate students. The process begins with a series of informal meetings. When a consensus emerges on a student's admission, it is formally recorded.

After Young, Khanna, and Schaffer left the meeting, Brauner asked that a reference in the report to *older* faculty be changed to *senior* faculty. He then provided an explanation for the departmental use of temporary instructors. Adjunct faculty members are usually associated with research projects, rather than classroom teaching. Confusion over appointments should be less in the future as the department reviews and revises faculty rosters. Ciuffetti asked about the confusion between review comments about post-tenure review and Young's response concerning annual reviews. She also asked about the differences between faculty proposals versus graduate student proposals. In the first case, Selker speculated that Young might not have understood the statement in the report. In the second case, he thought that the department had not fully addressed the cultural change that will take place when PhD students are present. Because this review focused on the MA in applied anthropology, greater attention to the PhD proposal is not appropriate for this particular review. Selker added that how faculty in the department conduct research and publish would undergo a major change when and if a PhD degree is initiated. Brauner agreed with Selker that the department would need to adapt to change in response to the new culture associated with the addition of the PhD. He said that the absence of a formal research committee reflects the diversity of faculty specialties. Commenting on the review process, Rettig reminded the Council that the department had an opportunity to correct error of fact and chose not to do so. They could submit a response to accompany the report as it is submitted to the Provost if they wish to do so. In response to Bond's question whether there is a periodic chair review in Anthropology, Selker and Fisk said that question did not come up as part of the review. Brauner explained that the Dean of the College of Liberal Arts asks faculty for comments as she conducts periodic reviews of department chairs.

The report, with the one word change (*older* changed to *senior*) was approved with one abstention.

V. Other Business/Announcements

Brauner asked the Council about his role when it reviews the proposal for a PhD in Community Impact Anthropology on March 13, 2003. The Council asked Brauner to chair the meeting as the department presents the proposal, but to excuse himself when the Council decides how to act on the proposal.

GRADUATE COUNCIL MEETING

February 13, 2003

3:00pm, Kerr Admin. Bldg. 650

Present: Brauner (Chair), Bird, Bond, Ciuffetti, Collins, Feller, Francis, Gobeli, Markle, Pedersen, Prucha, Sanchez, Selker

Absent: Fisk, Rettig, Watrous

Guests: Don Armstrong, Ursula Bechert, Vicki Ebbeck

I. Approval of Council Minutes

The minutes of the January 23, 2003, meeting of the Graduate Council were approved as submitted.

II. Professional Master's Degree Program Issues

On January 9, 2003, the Graduate Council approved a request from academic departments that are preparing to offer professional science master's degrees. At that meeting, they asked Don Armstrong (Botany & Plant Pathology) to return on February 13, 2003 to provide more detail about the mentoring of students in these new programs. Armstrong distributed copies of a document that responded to the Council's request for information.

Graduate students enrolled in Professional M.S. Degree Programs will be provided mentoring and advising support at least equivalent to that provided other non-thesis M.S. students. The graduate programs of these students will conform to the Graduate School requirements common to all non-thesis M.S. degree programs with the exception (that has now been granted) that 6-12 credits of internship will substitute for the customary 3-6 credits of research required on a 45-credit non-thesis M.S. program. Within that framework, we envision the supervision of students in these programs will occur as follows:

1. Each Professional M.S. Program will have a Program Director and a Program Advisory Board that will include representatives from industry. Faculty members of this Board will constitute an Academic Advisory Committee for the Program.
2. Initial orientation and advising for incoming students will be performed by the Program Director or a member or members of the Program's Academic Advisory Committee to whom this responsibility has been assigned. Graduate programs will be developed and filed for each student according to the usual Graduate School procedures.
3. During each term of the academic year, Professional M.S. students will be required to enroll in a 1-credit Seminar or Reading and Conference course. At least one of these courses will be designed specifically for professional M.S. students and will be under the supervision of the Program Director or a member of the Academic Advisory Committee for

the Program. This course may be used as a common forum for additional organized mentoring and advising activities.

4. Successful completion of an internship experience is a requirement of the Professional M.S. Degree Programs. Planning and securing an appropriate internship will require the active participation of the student enrolled in a Professional M.S. Program. However, assistance in these arrangements will be provided by a part-time staff person specifically assigned to arrange and coordinate internships for the Program or, alternatively, with the assistance of the Program Director or a member of the Academic Advisory Committee for the Program. [The manner in which this assistance will be provided depends upon the resources available to the Program. Ideally, a professional staff person (or persons) would coordinate and arrange internships (estimated 0.2 FTE per program).]

5. For internship experiences, liaison will be established with participating private sector companies and other employers as appropriate. An on-site supervisor will be identified for each internship experience. An informal report (email or phone conversation) will be requested from both the intern and the on-site supervisor midway through the internship experience. At the completion of the internship, the on-site supervisor for the internship will be expected to provide the Program Director with a written evaluation of the intern's performance. A written report evaluating the internship experience will also be required of the intern.

6. Upon completion of the internship experience, each candidate for a Professional M.S. Degree must pass the oral examination required of all non-thesis M.S. students. This examination is conducted by a faculty committee of at least 3 members. In the case of Professional M.S. students, it is anticipated that at least two members of the examining committee will be from the Academic Advisory Committee and represent the disciplinary area of the Program. The examination will cover course work, the internship experience, and any other areas of the student's program and training that are deemed appropriate.

Doug Markle (Agricultural Sciences) asked for clarification of the term "private sector" in item #5. Armstrong said that, although other employers allow for the inclusion of public sector internships, the private sector is the usual location for internships. John Selker (Engineering) asked how the program would guarantee a graduate level learning experience in a private sector internship. Armstrong answered that there will be continuing discussion with industry on this point, but most of the program's current industry contacts seem to understand that internships are to provide professional training opportunities, not just free labor. A related concern for the program is that industry wants students to work longer for an internship than is deemed appropriate by the program faculty. Students who develop internship proposals will be involved in identifying internship learning objectives. Selker argued that, unless internships can be guaranteed to provide true graduate level learning, they should be non-credit courses. Armstrong said that, if the program expands as expected, it will not be possible to give as many students access to the program if research/project is expected of every student who goes through the program or if the internship experience is not for credit. David Brauner (Liberal Arts) said that, based on his experience with internships in Anthropology, he had no problem with internships

for credit because of the mentoring that takes place before, during and after the internship. David Gobeli (Business) stated that the College of Business recently adopted the practice of awarding credit for internships so that they could manage the quality of the internships. Lynda Ciufetti (Science) noted that laboratory rotations, with assigned credits, are used in both the Molecular and Cellular Biology program and graduate programs in Botany and Plant Pathology. Barbara Bond (Forestry) thanked Armstrong for his further work and documentation in response to Council's earlier questions. The internship expectations are now much clearer. The Council approved the document submitted by Armstrong.

III. Master of Arts in Interdisciplinary Studies Review Report

Vicki Ebbeck (Health and Human Sciences), who chaired the review of the Master of Arts in Interdisciplinary Studies (MAIS) program, presented the final report of the review team. The summary and recommendations are included below:

The Master of Arts in Interdisciplinary Studies (MAIS) degree makes a unique and important contribution to the educational opportunities offered at Oregon State University. It stands to reason that in a complex world with many issues and problems that extend beyond traditional discipline boundaries, an interdisciplinary degree program is a particularly valuable asset to the university and society. Talented students have been attracted to Oregon State University specifically because the MAIS degree has allowed them to examine an area of study from an integrated perspective. The admission requirements are not overly restrictive, which permits promising candidates from diverse backgrounds to apply to the program. Moreover, the program itself is sufficiently flexible that there is plenty of opportunity for truly interdisciplinary exploration and, of course, the faculty representing the different disciplines benefit along with the student when a committee meets to collectively explore a thesis or research project. Clearly there have been some excellent examples of students who have been well advised by supportive faculty and who have thrived on the challenges that the MAIS degree has the potential to provide.

There are, however, several factors associated with the MAIS program that are at odds with the notion that what uniquely defines the MAIS degree is a true interdisciplinary experience. These factors pertain to both the existing degree requirements as well as how the degree is currently being implemented by certain units on campus. For example, at present applicants are not screened for interdisciplinary skills or potential. The MAIS can and certainly has been used as a refuge for weaker students or students who have exhausted all other possibilities at Oregon State University. In addition, there is no mechanism to assure an integrative element in each program of study. Certainly a student must complete credits in three fields of study, but there is no guarantee that the knowledge from the three fields will be integrated. This is especially true when the current requirements for the research paper speak to investigating in depth a subject from possibly *one* of the three fields of study. In reality, the MAIS often serves as a surrogate discipline-based degree for departments not authorized to offer graduate degrees.

The following recommendations, then, are designed to ensure that the MAIS is a degree program held in high esteem by the university community, interested applicants, and future employers. Some recommendations specifically target issues of quality control. At this time a MAIS student might never take even one graduate-only course. In addition, some students never feel as if they really belong to any one department and the quality of advising they receive can vary dramatically. This finding no doubt is influenced by how central the MAIS program is to any one department in terms of graduate degree offerings and is probably also influenced by the fact that currently departments do not receive any credit for working with MAIS graduates. Other recommendations speak more to a re-constituting of how the MAIS is viewed. It is imagined that only a relatively small number of graduate students across campus would pursue the MAIS degree having determined that they are interested in interdisciplinary work. Technically interdisciplinary work can be accomplished with the integration of only two disciplines or departments and, indeed, most discipline-based degrees require coursework from a second department. What will distinguish the MAIS, however, is that it will require the acquisition of knowledge from three departments and evidence that the information gained can be integrated.

Primary Recommendations

- Establish a clear vision of the educational purpose of the MAIS that should be to provide students with a true interdisciplinary experience.
- Require three different fields of study in a MAIS program with no two fields of study from the same department.
- Eliminate the requirement that one of the fields of study be from the College of Liberal Arts.
- Each applicant should identify the intended primary field of study and, if the applicant is accepted, the department representing the primary field should take responsibility for and be credited with the MAIS graduate student.
- Require each applicant when completing his or her letter of intent to describe an issue that lends itself to an interdisciplinary perspective and offer a plausible suggestion of how two or more specifically identified disciplines could be integrated to address the issue.
- Require that at least 50% of the credits (excluding blanket-numbered credits) on any MAIS program of study be graduate-only courses.
- Require that every MAIS thesis or research paper integrate at least two of the three fields of study.

Secondary Recommendations

- Offer a Master of Science in Interdisciplinary Studies (no language requirement) as well as a Master of Arts in Interdisciplinary Studies (language requirement consistent with a Master of Arts degree).
- Form a MAIS Advisory Committee comprised of representatives from the Graduate School and faculty involved with the MAIS degree to be responsible for reviewing and improving degree requirements and implementation.
- Clarify the operational differences between the thesis and research project options.
- Require that an MAIS program committee chair from the intended primary field be identified before an applicant is accepted to the MAIS program to facilitate the advising process.
- Require at least one integrative course in every MAIS program of study (e.g., Systems Thinking and Practice that is cross-listed as BA 565, ENGR 565, H 590, and HORT 590).

Sally Francis (Graduate School) thanked the review team and said that the Graduate School has begun considering the review. Robert Frank (Associate Dean of the College of Liberal Arts [CLA] and chair of the committee that created the self-study) thanked the review team and asked about the recommendation that no two fields of study be from the same department. He explained that CLA has many departments that are umbrella departments. An example would be the Department of Foreign Languages, which includes areas in three different languages plus a more general area allowing study of linguistics; at other universities each area (i.e., language) could be a separate department. Current MAIS rules allow a student to include two languages on an MAIS program of study; the proposed change would limit such studies. He noted that future merging of departments or programs to create units with multiple disciplines may pose a barrier for students who might be able to put together a particular interdisciplinary degree elsewhere but could not do so at OSU. Brauner said that the current use of the MAIS to allow inclusion of both archeology and anthropology in his department would also suffer from this change. Except for that concern, Frank supported the report. Brauner agreed that the recommendations are excellent, but he was concerned about the recommendation that MAIS programs require a foreign language. It was explained that the committee suggests adding a new Master of Science in Interdisciplinary Studies that would not include a language requirement.

Selker asked how many departments in the College of Liberal Arts do not have master's degrees and how well the MAIS serves the students from the departments for which it is the only graduate degree. Frank said that English, Anthropology, History, and Economics are the only departments in CLA that have disciplinary work at the graduate level. Other departments in CLA have access only to interdisciplinary degrees including the MAIS. Three-fourths of the departments in CLA have access only to interdisciplinary graduate degrees. In response to a question from Gobeli concerning the lack of master's degrees within CLA departments, Frank repeated his concern about limiting the MAIS by requiring three different departments.

In response to concern about the recommendation to “Require three different fields of study in a MAIS program with no two fields of study from the same department,” Gobeli asked for clarification of the terms *discipline*, *field of study*, and *department*. Selker suggested that using *degree program* might be clearer. Based on experience in Anthropology, Brauner agreed with Gobeli’s suggestion that discipline be substituted for department in the recommendation. Gobeli pointed out the use of the term department at the top of page two in the report. As written it would have some real meat but changing the intent by again saying that only two departments need to be represented in the degree takes it away. Ebbeck said that the review team intended to use the term department to stop inappropriate use of MAIS degrees as disciplinary degrees that had not been approved through established procedures. Bond pointed out that many departments include work in more than one discipline. She concluded that departments and disciplines are only loosely related. For example, the College of Forestry has a Wood Science and Engineering Department that hires all chemists, but that department is completely separate from the Chemistry Department.

The topic shifted to requiring integration regardless of the number of departments. Ebbeck said that requiring some true integration between at least two fields in the thesis or research-in-lieu-of-thesis was a step toward real interdisciplinarity. The review team hoped that this first step would lead to a true integration of all three fields because of the added rigor needed to integrate those fields. Ebbeck pointed out that, because there are many degrees that are typical discipline-based degrees, creating a truly unique interdisciplinary integration within a MAIS degree would require at least two, and preferably three different areas. Brauner reported that Anthropology has found it extremely difficult to integrate three different areas within a thesis. Brauner and Selker argued that blending three areas tends to create a multidisciplinary rather than an interdisciplinary program.

Bond asked whether MAIS students have problems being placed in careers after receiving their degrees and Gobeli asked how MAIS students market their degrees. Brauner said that those who emphasize the fact that they have multiple skills are more successful than those with a disciplinary master’s degree who are perceived as being one-dimensional.

Elaine Pedersen (Health and Human Sciences) expressed her enthusiasm for the recommendation to eliminate the requirement that one field must be from CLA and said that this will provide potential for new and creative programs of study. Selker, noting the lack of a recommendation for a director of the MAIS program, said that the Council supports the identification of a person or persons to direct the program. Francis said that the Graduate School is directed to oversee many of the interdisciplinary programs. In some instances, this generates resources for the program from the different departments represented in the interdisciplinary program. It was suggested that the Provost’s Fund for Excellence could be used to sustain the coordination of the MAIS degree program. Selker said that the lack of “someone” to send the report to points out the true lack of direction of the program. Ciufetti supported the creation of a continuing advisory committee.

Although the lack of a language requirement could be useful to engineers, Selker wondered whether a true “art” person should receive a Master of Science degree. Ebbeck responded that

the review team was trying to build consistency into the nature of the program; because a language requirement is not a part of the MAIS the name should be changed to the Master of Science in Interdisciplinary Studies. Bond asked whether computer languages fulfill the language requirement for a Master of Arts degree and was told that they do not. Tony Collins (Pharmacy) suggested that the name be Master of Interdisciplinary Studies, but Francis pointed out that this would require the creation of a different degree and would not be just a renaming of an existing degree. In response to Ciuffetti's observation that every Master of Arts degree requires a foreign language, Selker said that he was comfortable with allowing an exception to the rule that foreign language requirements are necessary for all Master of Arts degrees.

The Council accepted the report as presented. The Council also strongly recommended the hiring of a director for the MAIS degree program and endorsed the recommendation to create an advisory committee for the program.

IV. Criteria for Graduate Level Coursework

Bond introduced a document prepared by the Council's subcommittee that reviews new graduate course proposals (see **Expectations for Graduate-Level Teaching, and Differentiation between Undergraduate and Graduate Components of "Slash" Courses** below). She also noted that, even in high school, some of the higher levels of learning are expected. The appendix to the document includes some verbs that could be used in course syllabi for graduate students; these would clarify course expectations and might improve the likelihood that the 500 component of slash courses would provide truly graduate level learning. Brauner said that these guidelines have already been useful for his own writing of a proposal for a new course. Markle said that he shared the report with several colleagues who did not respond well to it. However, he expressed support for using these as new guidelines. Collins asked what steps would be taken if the new guidelines were adopted and students continued to complain about the absence of graduate level learning in slash courses. Francis challenged the Council to look at the question, "If I was looking for genuine graduate level learning, what would it look like that is separate and distinct from undergraduate level learning?" Does the language of the report guide us in making the distinction? Bond pointed out that the word "differentiation" comes from the language used in the Graduate Council policy of 1992 that created "slash" courses and that the policy perhaps needs to be changed.

Expectations for Graduate-Level Teaching, and Differentiation between Undergraduate and Graduate Components of “Slash” Courses

Background: The OSU Graduate Council policy (1992) on differentiation of graduate and undergraduate components of dual-listed courses (400/500 combination) states:

In dual listed 400/500 level courses, a distinction should be made between those students taking the course for undergraduate credit (400 level) and those taking the course for graduate credit (500 level). This distinction could be in the form of additional work required and/or a higher grading standard for the 500-level credit, or some other appropriate means identified by the instructor.

The policy is not clear about the nature of the “additional work” and “higher grading standards” that should be required for graduate students. This had led to a great deal of confusion about how to differentiate between the graduate and undergraduate components of dual listed courses. The Task Force on Graduate-Level Learning reported in 2001 that nearly half of the instructors of dual-listed courses who responded to a survey reported that they were “not at all” or “only minimally” familiar with requirements for additional expectations of the graduate component for dual listed courses. In classes where there is a clear differentiation, by far the most common approach is to require “an additional, or longer, term paper or lab report.” However, half of the graduate students enrolled in courses with such policies felt the courses did not provide a high-quality graduate-level experience. The Task Force concluded that there is a need for Graduate Faculty to be trained concerning University expectations for Graduate teaching.

The problem: In light of the 1992 policy for differentiation in “slash” courses, the Graduate Council committee that is responsible for reviewing Category II proposals (the “cat II review committee” – Fisk, Sanchez, Bond) must determine whether proposals for new “slash courses” include appropriate differentiation between the graduate and undergraduate components. As far as we know, there is no standard or policy at OSU concerning expectations for Graduate teaching, so committee members must use their own best judgments. All three current members of the committee feel that this distinction is inadequate in many, and probably most, course proposals. Not surprisingly, the faculty members who submit the proposals are often frustrated when they are asked to enhance the differentiation between the 400 and 500 components of their proposed courses. The cat II review committee concludes that there is a need to define University expectations for Graduate teaching.

A proposal: To this end, a change is proposed in the wording of the Graduate Council policy on differentiation of graduate and undergraduate components of dual-listed courses. This new policy, with the three additional paragraphs of explanation and accompanying appendix, should be distributed to all members of the Graduate Faculty and to all units that offer graduate-level courses.

Proposed 2003 Graduate Council policy on differentiation of graduate and undergraduate components of dual-listed courses (400/500 combination) “In dual listed 400/500 level courses, a distinction should be made between learning outcomes for students taking the course for

undergraduate credit (400 level) and those taking the course for graduate credit (500 level). ***This distinction should include emphasis on developing skills in analysis, synthesis, and/or evaluation for the 500-level credit, as opposed to, or in addition to, acquisition of knowledge, comprehension and application of information, which are more characteristic of undergraduate curricula. The different student learning outcomes should be accompanied by appropriate differences in instructional opportunities and evaluation procedures.***

It is expected that all courses at OSU, both at the graduate and undergraduate level, will be designed around well-defined student learning outcomes. Student learning outcomes encompass the range of student attributes and abilities, both cognitive and affective, that students should acquire after successful completion of the course. Cognitive outcomes include demonstrable acquisition of specific knowledge and skills: what do students know that they didn't know before, and what can they do that they couldn't do before? Affective outcomes include change in students' values, goals, attitudes, self-concepts, world views, and behaviors.

The primary distinction between undergraduate and graduate courses should be in the quality of learning outcomes as opposed to the quantity of work. Bloom's taxonomy (Bloom, 1956; also see appendix 1) provides a possible basis for ranking the quality of cognitive learning outcomes. These are (from lowest to highest-order), 1. knowledge, 2. comprehension, 3. application, 4. analysis, 5. synthesis, 6. evaluation.

Whereas learning outcomes in undergraduate courses are likely to focus primarily (although not exclusively!) on *knowledge, comprehension* and *application*, learning outcomes in most graduate courses, including the graduate component of 400/500 dual listed courses should include, *analysis, synthesis* and *evaluation*.

Appendix 1. Explanation of the 6 levels of cognitive competency in Bloom's Taxonomy

Competence	Skills Demonstrated
<p>Knowledge of terminology; specific facts; ways and means of dealing with specifics (conventions, trends and sequences, classifications and categories, criteria, methodology); universals and abstractions in a field (principles and generalizations, theories and structures): Knowledge is (here) defined as the remembering (recalling) of appropriate, previously learned information.</p>	<ul style="list-style-type: none"> • observation and recall of information • knowledge of dates, events, places • knowledge of major ideas • mastery of subject matter • <i>Question Cues:</i> list, define, tell, describe, identify, show, label, collect, examine, tabulate, quote, name, who, when, where, etc.
<p>Comprehension; grasping (understanding) the meaning of informational materials.</p>	<ul style="list-style-type: none"> • understanding information • grasp meaning • translate knowledge into new context • interpret facts, compare, contrast • order, group, infer causes • predict consequences • <i>Question Cues:</i> summarize, describe, interpret, contrast, predict, associate, distinguish, estimate, differentiate, discuss, extend
<p>Application; the use of previously learned information in new and concrete situations to *solve problems that have single or best answers.</p>	<ul style="list-style-type: none"> • use information • use methods, concepts, theories in new situations • solve problems using required skills or knowledge • <i>Questions Cues:</i> apply, demonstrate, calculate, complete, illustrate, show, solve, examine, modify, relate, change, classify, experiment, discover
<p>Analysis; the breaking down of informational materials into their component parts, examining (and trying to understand the organizational structure</p>	<ul style="list-style-type: none"> • seeing patterns • organization of parts • recognition of hidden

of) such information to develop divergent conclusions by identifying motives or causes, making inferences, and/or finding evidence to support generalizations.

Synthesis; creatively or divergently applying prior knowledge and skills to produce a new or original whole.

Evaluation; judging the value of material based on personal values/opinions, resulting in an end product, with a given purpose, without real right or wrong answers.

meanings

- identification of components
- *Question Cues:*

analyze, separate, order, explain, connect, classify, arrange, divide, compare, select, explain, infer

- use old ideas to create new ones

- generalize from given facts
- relate knowledge from several areas

- predict, draw conclusions

- *Question Cues:*
combine, integrate, modify, rearrange, substitute, plan, create, design, invent, what if?, compose, formulate, prepare, generalize, rewrite

- compare and discriminate between ideas

- assess value of theories, presentations

- make choices based on reasoned argument

- verify value of evidence

- recognize subjectivity

- *Question Cues*

assess, decide, rank, grade, test, measure, recommend, convince, select, judge, explain, discriminate, support, conclude, compare, summarize

GRADUATE COUNCIL MEETING

January 23, 2003

3:00pm, Kerr Admin. Bldg. 650

Present: Bond, Ciufetti, Collins, Feller, Fisk (Acting Chair), Francis, Pedersen, Prucha, Rettig, Sanchez, Selker, Watrous

Absent: Bird, Brauner, Markle

Guests: Stephen Giovannoni, Sherman Bloomer, Wayne Kradjan

I. Approval of Council Minutes

The motion to accept the minutes from January 9, 2003 passed.

II. Category I Proposal for a Master of Science in Molecular and Cellular Biology

Stephen Giovannoni, (Director, Molecular and Cellular Biology Program [MCB]) introduced a proposal for a Master of Science degree in Molecular and Cellular Biology with a brief history of the MCB graduate program. Because MCB is an interdisciplinary program, which draws on faculty in many academic departments at OSU, and because master of science disciplinary degrees also are available in the departments that participate in the MCB program, the faculty members who developed the proposal for a PhD degree in MCB did not anticipate the need for the MS degree. MCB faculty have since concluded that it was a mistake to start a doctoral degree program without a master's degree option. Students whose career plans changed after entry into the PhD program were not able to cut their studies short by switching to the MS degree as is done in other programs.

The proposal before the Council provides for future participation in the professional science master's degree project, which was discussed by the Graduate Council on January 9, 2003. Giovannoni chose to include a discussion of the professional master's degree project in the current proposal with the understanding that the MS in MCB will comply with Graduate Council requirements that affect all professional science master's degree programs. Sherman Bloomer (Dean of the College of Science) said that 10 years ago MCB master's degree holders may not have been able to find work, but this is no longer the case. The professional science master's degree programs at Oregon State University are being funded in part by a grant from the Sloan Foundation and are often referred to as "Sloan masters." The College of Science would be exploring this type of initiative even if the Sloan program did not exist. Lynda Ciufetti (Science) explained that the idea of adding the MS to the current PhD in MCB has been under discussion for a long time and that the need for a master's degree has become increasingly apparent in recent years. John Selker (Engineering) asked whether any conflicts with graduate programs in other departments existed, whether liaison had been established with other departments and, if so, what the response was. Giovannoni replied that no negative responses were received after he

sent a letter to all departments involved. He also reported that, in private conversations, the other departments in the College of Science supported this proposal. Letters of support are attached to the proposal.

Barbara Bond (Forestry) asked whether the requirements for the professional master's degree outlined in this Category I proposal are equivalent to the professional master's degree described by Don Armstrong at the January 9, 2003, Council meeting. Martin Fisk (Oceanic and Atmospheric Sciences) summarized the motion concerning professional master's degrees adopted at the January 9 meeting. (Fisk had moved to approve the use of internships as capstone experiences for specified areas of concentration in existing degree programs, with a minimum of 6 credits of internship and a maximum of 12 credits of internship allowed on a 45 credit non-thesis MS degree, conditional upon submission to the Council of: 1) a description of the internship outlining a) who will be supervising the students, b) how the internship will be evaluated and c) the nature of the final defense/exam and 2) a Category 1 proposal for a new professional masters degree submitted to the Graduate Council prior to the end of the Sloan Foundation grant.)

Giovannoni pointed out that MCB was submitting a proposal with both thesis and non-thesis options. David Gobeli (Business) asked how many students will participate in the program and how they will be supervised. Giovannoni said there are approximately 30 PhD students in the program now; adding 4 to 10 MS students would not crowd the current classes, with the exception of MCB 525. Selker asked what kind of experiences would be required if non-thesis students participate in internships. Giovannoni said that a research component, which would fulfill the capstone requirement for all master's degrees, would still be required. Selker asked whether non-thesis students must fulfill a writing requirement. Giovannoni said that non-thesis students would still be required to present the results of their research to their advisory committees and would still be required to write a research paper as a part of the final examination.

Fisk asked whether the proposal contained one degree or two. Giovannoni said that this Category I proposal asked for one degree, but allowed either a thesis or non-thesis option for the master's degree. Giovannoni added that this proposal would enable the students to meet degree requirements until a separate professional master's degree is approved. Bond did not see any differentiation in learning outcomes between the thesis and non-thesis options. Sally Francis (Graduate School) pointed out that many programs throughout the university offer both thesis and non-thesis options for the Master of Science. She added that the Council should treat the part of this proposal that will be the vehicle for the professional degree the same way it had treated other professional master's degrees on January 9, 2003. Bloomer argued that it is not appropriate for someone in a master's degree to be expected to submit a mini-PhD dissertation. Rather, faculty should recognize that there are important differences between the two degrees. Bruce Rettig (Graduate School) pointed out that some departments choose not to have a non-thesis option in their MS degree, relying instead on other non-thesis master's degrees such as the Master of Agriculture. The creation of a master of applied science degree would provide an alternative for those departments that did not wish to offer non-thesis MS degrees. Bloomer

shared his views on what he saw as a debate on applied science. He argued that “applied science” implies a distinction between applied science and so-called “hard science” that does not exist.

Wayne Kradjan (Dean of the College of Pharmacy) said that the relationships and collaborative efforts that occur in internship situations could be of great benefit to graduate students. After noting that he has been working very closely with industry recently, Giovannoni argued that a new breed of biotechnology industrialist is at work today. Although universities have not been doing a good job of training people to fill the jobs in industry, this proposal would allow OSU to contribute to this vital and expanding sector and to train students for biotechnology jobs.

In response to a question from Barbara Watrous (Veterinary Medicine) about statistical requirements for MCB MS students, Giovannoni identified a current class in bioinformatics that would fulfill that need. Bloomer said that bioinformatics might constitute a specialization area within MCB.

Selker, noting that many universities differentiate between thesis and non-thesis requirements, argued that the Council should examine these distinctions, not only in regard to this proposal, but also with respect to other degree programs at OSU. Fisk, recalling the passage just two weeks ago of a motion concerning the professional master's degree and the use of internship to fulfill capstone requirements, suggested that the Council was being asked to act on the same issue, but in a slightly different fashion. David Gobeli (Business) and Bond added their concern about the need for advising by OSU faculty, not just by researchers in industry.

Giovannoni said that he was willing to revise his proposal in light of new information from the planning group working on the Sloan project and from the Graduate Council. He also described his agreement with a draft of material that Don Armstrong was circulating among the professional master's degree program planners in anticipation of his return visit to the Graduate Council. Martin Fisk (Oceanic and Atmospheric Sciences) said the Council's concerns are with the description of the internships, especially who will supervise them.

Ciufetti pointed out that two issues are being considered at one time. What Giovannoni is presenting is a Master of Science in MCB and what was presented two weeks ago was a professional degree with internship used to fulfill capstone requirements. Francis delineated the differences between the earlier motion and this proposal. Internships would not be used to fulfill capstone requirements as this proposal is worded, but this master's degree would be used to fulfill Sloan requirements. She also pointed out that the degree program would be subject to all subsequent decisions by the Council.

Bloomer said that, if the Sloan program did not exist, Giovannoni would be coming forward with both a thesis and a non-thesis option; if the non-thesis option used internship to fulfill capstone requirements, the Council would be right to have legitimate concerns about internships. Fisk argued that spending 6 to 12 weeks in a research lab is not equivalent to writing a research paper. Bond added that non-thesis requirements should be consistent across the campus. Bloomer

pointed out again the snobbism inherent in the “thesis equals better” versus “non-thesis equals worse” distinction.

Wende Feller (student) asked for clarification about the projected number of students. Giovannoni answered that if the Sloan grant was successful, 10 additional students would be added to the program; he added that the program has generated a great deal of interest already.

The issue of appropriate mentoring was discussed and a suggestion that every student should have a faculty advisor resulted. Giovannoni said that he believes a mid-term report by the internship advisor should be required for each student in order to prevent any problems at the site of the internship. Selker pointed out that every master’s degree requires a major professor. Discussion revolved around the use of a major professor versus an internship supervisor. While every master’s degree student at OSU must have a major professor, the presentation at the January 9, 2003 meeting suggested that only an internship supervisor would be advising students. Differing interpretations were offered about Armstrong’s concern about the difficulty in gaining wide involvement in Botany and Plant Pathology if faculty working with the professional master’s degree program were also required to supervise a directed research project.

A motion was passed to approve the Category I proposal to establish a Master of Science in MCB conditional upon the addition of a paragraph describing the oversight of the non-thesis option prior to forwarding the proposal to the Curriculum Council .

III. Graduate Level Learning

On November 14, 2002, the Graduate Council approved a new policy requiring that 50% of all credit hours on a graduate program of study (not including capstone activities such as thesis, research-in-lieu-of-thesis or internship) be stand-alone graduate credits. Some Council members interpreted this motion as allowing the remaining credits to include upper division undergraduate courses, but other Council members argued that permitting the use of undergraduate credit on a graduate program of study was not part of the November 14 action. It was agreed that if the Council wished to permit the use of 400 or 300 level courses on a graduate program of study, a new action to that effect would be needed.

Fisk said that he was in favor of allowing 300 and 400 level courses on programs of study, subject to the approval of the student’s advisory committee. Ciuffetti said that she would have voted against the policy change approved on November 14, 2002, if it had included an allowance of 300 or 400 level coursework. Selker, observing that the whole conversation on slash courses came forward as a result of concerns raised during the accreditation review, asked whether the request to allow undergraduate courses on a program of study would resolve a problem that does not exist. Fisk said that students pursuing interdisciplinary programs are at a disadvantage because, although they have a strong background in one discipline, they need to take undergraduate courses in a different discipline before they are able to work across disciplinary lines.

Alex Sanchez (Education) pointed out that allowing some undergraduate courses would provide flexibility, but that the student's advisory committee is the final arbiter on the program content. Rettig pointed out that, in the case of master's degree programs, there often is no complete committee prior to the final examination. Unless a student declares a minor, the only signatures required on a program of study for a master's degree are those of a major professor and the head of the department or program.

Bond reminded the Council that this discussion grew out of need to limit the number of slash courses on graduate programs. Believing that most graduate students have some deficiencies in their background, she argued for allowing a small number of 400 level courses on programs of study to help students overcome those deficiencies. Ciuffetti, who was uncomfortable in solving problems that do not exist, asked whether proper 400/500 level courses would meet the need identified by Bond. Fisk noted that the National Science Foundation, which is funding an IGERT (Integrative Graduate Education and Research Traineeship) program at OSU, has asked whether any institutional changes have come about due to the interdisciplinary nature of graduate education. NSF, having observed many barriers to interdisciplinary education, is encouraging changes that would allow new types of education to evolve. Ciuffetti said that a PhD student, even on an NSF grant, should have at least 50% graduate-only credits on his/her program. Gobeli suggested that flexibility in coursework could be achieved several ways. Bond reminded the Council that offering more courses would not be an option for most departments. Feller observed that allowing 300 and 400 level courses diminishes the rigor of graduate programs. Selker said that another solution to the problem would be to require fewer graduate level credits in total. Fisk said that students who must take an undergraduate course as a prerequisite and who cannot place those courses on a graduate program of study, face substantial challenges. The cost of education in those circumstances could hinder the ability of students to finish their degrees. Selker pointed out that, because 12 credit hours per term is an average course load at OSU, 45 credit hours is not that difficult to achieve during the two years common to most master's studies.

Francis reminded the Council of the creation three years ago of a task force on graduate level learning to investigate the concerns about 500 level courses at OSU. In the past two years, exit surveys conducted by the Graduate School have identified concerns about the quality of graduate instruction, although there is no way for us to identify the source of this concern. Regardless of criteria put in place by Graduate Council, no one is present in classrooms to enforce requirements that 500 level courses meet requirements set for graduate level learning. Francis also observed that, in a survey of our peers, we are the only institution that does not allow undergraduate course work on graduate programs; some allow as many as 22 credit hours. Rettig pointed out that those institutions do not have slash courses. Fisk suggested that a number of slash courses might be eliminated as a result of the requirement that graduate programs require 50% of stand-alone graduate course work. Bond observed that slash courses often are used to increase the number of students enrolled in the course. The problem arises when the instructor does not offer an adequate graduate level learning experience.

Bond stated her frustration that a Council action to eliminate slash courses last year was cancelled by lack of support from the Curriculum Council. Selker suggested that another way to

eliminate the problem with slash courses is to adequately police the requirements for a 500 level component.

Ciuffetti argued that use of 300 and 400 level course work on PhD programs of study would water down that degree. Elaine Pedersen (Health and Human Sciences) observed that, because master's level work can be used on a PhD program of study, allowing 300 or 400 level course work for master's degrees would imply that they could be permitted on PhD programs.

A motion was offered that a committee craft a resolution for consideration, that the Council consult with all academic departments in the university regarding this issue and that the Assistant to the Dean work to provide the feedback from the departments to the Council. This motion and any further action were delayed to a future Council meeting. Bond suggested that slash courses and the number of credits of 400-level courses should be considered together at that time.

Ciuffetti asked Bond whether the Task Force on Graduate Level Learning had polled departments to determine the economic impact of eliminating slash courses. She added that problems could be created for graduate education at OSU if 500 level courses are eliminated because of lack of resources.

IV. Category I Proposals from Public Health

Anna Harding (Chair, Department of Public Health) presented two Category I proposals. That department has been looking for ways to streamline their efforts; the prospect of a graduate program review helped to focus and accelerate their thinking. The MS degree in Health and Safety Administration degree was created several years ago—before the creation of the Master of Public Health in Health Care Administration. The Occupational Safety option can better be served by use of the Environmental Health Management degree.

A motion was offered to approve the elimination of the Health and Safety Administration degree. In response to Feller's question about students in the program, Harding said that students will be allowed to graduate with the degree in which they are currently enrolled, but she added that new students would not be admitted. The proposal to eliminate the Health and Safety Administration degree is related to a separate proposal to change the name of the Environmental Health Management degree to Environmental Health and Occupational Safety Management. Harding reported that, in her conversations with students, she learned that they believe the new degree name will better serve their needs.

The motion to approve the elimination of the Health and Safety Administration degree was unanimously approved. A second motion—to rename MS in Environmental Health Management to Environmental Health and Occupational Safety Management—was unanimously approved.

GRADUATE COUNCIL MEETING

January 9, 2003

3:00pm, Kerr Admin. Bldg. 650

Present: Brauner (Chair), Bond, Collins, Feller, Fisk, Francis, Markle, Pedersen, Prucha, Rettig, Watrous

Absent: Bird, Ciufetti, Sanchez, Selker

Guests: Don Armstrong, Ursula Bechert, Betty Duvall, Sam Stern, Vince Remcho

I. Approval of Council Minutes

The motion to accept the minutes from December 12, 2002 was passed.

II. Capstone credits, internships, and professional master's degrees

Don Armstrong (Botany & Plant Pathology) presented a request to the Graduate Council for the use of internships as capstone experiences for professional master's degree programs. The Sloan Foundation contacted Oregon State regarding a professional master's degree; such a degree would provide an alternative to the more conventional thesis path. A grant was obtained to help support these degrees. The new master's programs will require 1) use of internships as capstone experience, 2) an advisory committee of industry and government affiliates, and 3) a set of common courses including work in computer skills, ethics, and communication. Four initial programs are under development at OSU: *applied biotechnology*, which will be initially offered by the Genetics Program but added to the Molecular and Cellular Biology Program after their MS degree program is approved; *applied systematics*, which will be offered by the Department of Botany and Plant Pathology; all areas of concentration within the applied physics degree offered by the Physics Department; and all areas of concentration offered by Environmental Sciences. A program in the Chemistry Department is still in development. Armstrong reported that the professional master's programs are continuing to evolve. The participating academic units anticipate that the first group of students to be admitted will enroll Fall 2003. Armstrong said that, for professional master's degree programs to work most effectively, the Graduate Council must approve the use of internship hours for capstone requirements. His suggestion would be for a minimum of 6 and maximum of 12 internship credits on a 45-credit degree program.

When asked how many other universities are offering professional master's degree programs, Armstrong replied that there are about 30. David Brauner (Liberal Arts) asked whether most of the potential students would be people currently working in industry. Armstrong said that some will be OSU undergraduates and others will come from industry. Many inquiries about the programs have been received.

Barbara Bond (Forestry) asked whether it was appropriate to allow these degrees to carry the title of Master of Science, or whether another type of degree would be more appropriate.

Armstrong suggested that, later on, it would be appropriate to create another degree (perhaps Master of Applied Science); but, such a new degree cannot be approved quickly enough to allow participation in the program by Fall 2003. Doug Markle (Agricultural Sciences) observed that the existence of eight different master's degree programs currently offered by OSU sets precedence for this kind of program, although he also supported the use of a degree name other than the Master of Science. Armstrong noted that the effort to establish this program under currently authorized degree requirements has already caused some problems for some departments. However, each department is trying to handle the difficulties differently. In response to Markle's question about whether there is a move to create a Master of Applied Science, Armstrong answered that it would take at least two years for that to happen, given curriculum approval procedures. Brauner suggested that an end date to the use of the MS degree for these professional master's degrees should be part of any motion passed by the Graduate Council concerning the use of internship as capstone.

Elaine Pedersen (Health and Human Sciences) asked whether an internship report will be one of the degree requirements. Armstrong said that a final report to the university at the end of the internship experience would be required.

Sally Francis (Graduate School) wondered how many of the other universities with approved professional master's degrees are using the MS and how many are creating professional master's degrees with other titles. She mentioned national efforts to re-envision the PhD and wondered whether the same type of evolution is happening as a result of professional master's initiatives. Bond was concerned about the precedent set by this program. Brauner noted that the MS is traditionally viewed as a degree in which the student does research, creates a publishable article, and is academic. The MS and MA programs should be differentiated by name from a degree that is based on work experience. Francis asked what the professional master's programs require for learning outcomes and how these differ from the learning outcomes for the other master's degrees. Brauner recalled the Council's action on the Master of Business and Engineering degree program at an earlier Council meeting, which led to endorsement of the creation of that professional degree. Wende Feller (student member), noting that other departments make a distinction between a professional and an academic degree, said that the units with professional master's degrees should provide explicit information about the final exam.

Barbara Watrous (Veterinary Medicine) asked whether the number of required credits of internship is consistent among the four professional master's degree programs. In response, Armstrong asked the Council how many credit hours of internship they were willing to allow for a 45-credit program of study. He said that the faculty developing these programs have thought of the size of the internship in terms of number of terms rather than number of credits. Because most internship experiences are likely to take a minimum of six months, he suggested that the number of credits should reflect that amount of time.

Bruce Rettig (Graduate School) pointed out that the professional master's degree programs could meet current MS program requirements by adding a minimum of three credits of research-in-lieu-of-thesis to a program of study. He also said that the MS degrees in Science Education and Mathematics Education currently use internships to fulfill capstone requirements. Armstrong argued for a motion that would not require students to add research or project hours to their

programs of study and be assigned major professors in the usual sense. He fears that this would eliminate interest by the faculty. It would also overtax heavily committed faculty, especially those coming to the university from industry.

When pressed for details on internship, Armstrong said that this has not been determined. Discussions are continuing about how the internships are going to be administered and how faculty will mentor students in internship positions. Brauner asked whether there would be a committee to oversee the students. Armstrong said that there would be, although the process may vary between the four participating departments. He added that the Dean of Science is supportive of these programs (although a specific commitment to date has only been asked for and made for the applied biotechnology program). Program overseers estimate that one full-time and one half-time person would be needed to direct this program. Markle asked whether liaison had been established with programs that currently use internships as the foundation of a degree. Armstrong reported that the Sloan Foundation wants faculty to go out to internship sites.

Rettig noted that the Council is being asked to approve the concept of using internships as capstone activity in a Master of Science in these programs. The graduate catalog defines capstone requirements thus: "All master's degree programs require a minimum of 45 graduate credits including a thesis (6 to 12 credits) or research-in-lieu-of-thesis (3 to 6 credits)." Bond asked whether these specific programs can use internships as capstone or whether all units offering MS degrees can use internships as capstone; she sees these as quite different questions.

Martin Fisk (Oceanic and Atmospheric Sciences) noted that, on the web page for the Environmental Sciences professional master's degree program, up to 30 credits of internship would be allowed on a 45-credit program. Armstrong said that the request he is submitting on behalf of the groups with professional master's degrees is for 6 to 12 internship credits on a 45 credit program. The reason for coming to the Council is to standardize these programs. The intention is to keep the four departments within the same guidelines and to keep the guidelines congruent with university policy. Armstrong said that his request is narrow. Can internships be allowed as capstones for these programs? And, can 6 to 12 credit hours of internship be permitted as the capstone on a 45-credit hour program?

David Gobeli (Business) asked again how the internships would be managed. Armstrong noted the rigor of the degree programs in the departments in question at OSU. The professional master's program departments are working with industry people who would be heavily involved in the supervision of interns. Armstrong noted again that the current university requirement for 3-6 research credits on non-thesis degree programs would hamper this program as it tries to move forward. He also observed that Physics will use both a thesis and a professional track in their Master of Science in Applied Physics.

Brauner asked whether the Council would see the proposal again if it is passed at this meeting. Francis said that a Category I proposal is needed only if a new degree is established. Armstrong wanted to make sure that the Council had some kind of oversight to the changes that are needed, especially since keeping the research component in the program of study would hamper the Sloan program. Gobeli asked how fast the Master of Business and Engineering degree would be

approved. Rettig said that the faculty in Engineering hope to be able to accept new students Fall 2003, but that degree approval processes could delay the process.

In response to Bond's question about the length of the Sloan Foundation grant, Armstrong answered that the current grant runs until the summer of 2004, but that the OSU recipients have asked for an extension of six months.

Fisk asked that more time be given to the discussion to this proposal. Bond asked whether conditions or limitations could be placed on the approval. Armstrong said that it would be reasonable to require a Category I proposal for a new degree at a later date, and he added that the person directing the program would be willing to work on that. Armstrong noted that the College of Science has given its support to continuing this program after the funding from Sloan ends. But, Armstrong added, the idea of making this a "temporary" change to capstone requirements might not meet the expectations of the Sloan Foundation. Gobeli asked whether an interim approval is appropriate. Armstrong repeated that the programs are currently operating under the university guidelines and, if forced to do so, could continue to do that, although this would greatly hamper the programs.

Fisk reminded the group of the problem on the Environmental Science web page, saying that 30 credit hours of internship could be used on an MS program of study (which is presumably the 45 credit hour minimum). Armstrong said that the point of asking for Graduate Council for approval to this proposal is to make sure that no department allows more than 6 to 12 credit hours of internship on a 45-credit hour program. Armstrong said that the Sloan Foundation funding is already into its second year and any delay could kill the program. To keep pace with the Sloan funding, this request needs to be expedited by the Graduate Council. Francis commended Armstrong and his group for being proactive. Even if they were premature in asking for this change in graduate degree requirements, their action contrasts with many programs that wait too long.

Fisk moved to approve the use of internships as capstone experiences for specified areas of concentration in existing degree programs, with a minimum of 6 credits of internship and a maximum of 12 credits of internship allowed on a 45-credit non-thesis MS degree, conditional upon submission to the Council of

- 1) a description of the internship outlining a) who will be supervising the students, b) how the internship will be evaluated and c) the nature of the final defense/exam and
- 2) a Category I proposal for a new professional masters degree submitted to the Graduate Council prior to the end of the Sloan Foundation grant.

The Graduate Council also asked that Don Armstrong report on progress of the programs at the the February 13, 2003 Graduate Council meeting.

III.OSU 2007

Because the comment period for OSU 2007 will end shortly (January 15, 2003), any comments on the proposals are needed soon. One issue is especially important. The approval of the Graduate Council for graduate curricula is noticeably absent in all of the OSU 2007 proposals.

Brauner asked whether Francis could provide information about the proposals by email. Francis suggested that Council members email their comments as soon as possible to the appropriate OSU 2007 groups.

IV. Community College Leadership Program Review Report

Vince Remcho (Chemistry), who chaired the Graduate Council review of the Community College Leadership Program introduced the committee's report. He reviewed the following commendations and recommendations:

Commendations

1. The OSU Ed.D. Community College Leadership Program provides preparation for greatly needed community college leaders and administrators.
2. The Community College Leadership Program provides these services in a format that is friendly to working professionals, and which is being recommended and requested nationwide. This includes the use of cohorts, the intensive long weekend per month, and web-based communication.
3. The faculty of the Community College Leadership Program give "over and above" of themselves and create positive interpersonal relationships that result in a quality learning environment.
4. Students and faculty expend extra effort in order to avail themselves of the unique and positive environment created by Silver Falls State Park.
5. The retention and completion rate for candidates is improving steadily.
6. The Community College Leadership Program's reputation is attracting people from other states despite logistical barriers they must overcome.

Recommendations

1. Set up an advisory council with members of faculty, community college administrators, and outside evaluators involved in research on community colleges (such as a professor from another university), to evaluate the program content to assure that the rigor and content meet the standards set in the field.
2. Strengthen the assessment of the coursework portion by providing specific guidelines for the portfolio, the option of a formal written examination, or some combination thereof, or consider alternatives to the reflective portfolio/essay for the prelim exam. This assessment should be directly related to the course content and should be something that addresses doubts regarding the rigor of the program.
3. As resources become available, expand the program in order to serve more doctoral students throughout the Western States.

4. Ensure that students obtain sufficient education in quantitative analysis of data and in experiment design. Add at least one true statistics course to the program –preferably one that also introduces students to a statistical program they can use. This seems to be fairly standard in other such programs and is a notable omission here.
5. Require only one community college (adjunct) member on Ed.D. committees and permit faculty from other departments at OSU (such as statistics, philosophy, political science, etc.) to participate. This will foster critical, regular, periodic peer evaluation of the program and its outcomes.

Remcho also reviewed the following comments from a response from Betty Duvall (director of the Community College Leadership Program):

- A course in statistics has been approved by SOE faculty for inclusion in all doctoral programs
- Portfolio guidelines were developed and approved by the CCLP faculty three years ago and have been widely distributed to students and used by them. (Guidelines are included in the Orientation Manual each student receives and is reviewed during the Orientation as well as in later discussions.)
- The faculty cited as "not part of the core faculty" have served as major professors, taught courses in the program and participated in program meetings
- There are core course requirements in the CCLP for all students (75 hours). Additional courses are accepted in transfer from Master's Degree work. Content for those degrees is almost always an academic area other than education. In community colleges, it is common for staff to hold a content Master's Degree as a faculty member. If they choose to continue as a faculty member they may pursue a doctorate in that content area; however, if they choose to pursue a leadership (administrative) position, they are likely to pursue a doctorate in education. The CCLP acceptance of transfer work in a subject area other than education is a reflection of community college requirements.
- It is true that Silver Falls, the site used for class meetings, has "no facilities for a computer lab". However, this is not germane. Students come from institutions with rich computer resources and all have individual access to computers, necessary for the supplemental course work done between classes. Students regularly use computer software in data analysis for their dissertations.

Sam Stern (Dean of the School of Education) spoke as one of the faculty who helped develop this program and one who teaches in it each year. Stern noted that three community college presidents in the western U.S. are graduates of the program, that 26% of the students are persons of color, and that students fly to the program study site each month from out of state. He also said that personal recommendations from alumni and others knowledgeable of the program are helpful to the admissions process. Duvall agreed with Stern that the review conducted by the

Council has been helpful, both to validate what the program is already doing and to suggest what the program needs to do differently. Recommendations will be treated with all due concern.

Fisk asked about the need for new faculty. Stern announced that Duvall has officially retired. One new person has been hired, new faculty will be brought on board if at all possible, and Duvall has agreed to stay on half time for a short time. He added that he thanked Council members for their service as Graduate Council Representatives on EdD committees.

Gobeli noted that the recommendations within the report were apparent in the committee meeting at which he was a Graduate Council Representative. Watrous asked whether there was rigor in acceptance into the program. Francis answered that word of mouth is a big part of the recruitment for the program, so many of those seeking admission are hand-picked. Watrous also asked about the future of the program because of the lack of faculty and the retirement of Duvall. Fisk expressed concern over the use of transfer work that was 20 years old and over the use of course work from other academic majors on the program of study; he, wondered why the review team failed to provide a recommendation on this issue.

During the discussion of the recommendation about committee composition, the question was whether one Community College member is *required* or whether only one is *permitted*. What does it mean that they would be required to have only one rather than two? Rettig explained the concept of courtesy faculty and how those from outside the university become involved in service on advisory committees within the School of Education.

The motion to accept the report, but to ask for a follow-up review in one year, was approved. The purpose of the follow-up review will be to review all the recommendations, but especially the concern in the report about the level of rigor of the program.

VI. Scholarship and Fellowship Award Decisions

Mary Prucha reported that soon she will be soliciting nominations for centralized graduate scholarship and fellowship programs administered by the Graduate School. The award selection process, in which the Graduate Council participates in part, will begin toward the end of February and continue through Spring term. Typically, Council members serve on some, but not all, award selection committees. This is dependent mostly upon the restrictive nature of the funding program, the current ability of the given funding program to provide awards to all nominees, and/or the competitiveness and prestige of the funding program.

Prucha sought advice from the Council regarding the extent to which members were satisfied with the current configuration of selection committees and their involvement with selection process. She offered three alternatives for Council consideration: 1) expand existing assignments of Council members who are currently assigned to participate in the upcoming selection process; 2) establish additional selection committees comprised of Council members who are not yet assigned to participate in this year's process; or 3) leave the Council's current level of involvement in place as is. Any changes the Council wishes to recommend would need to be implemented quickly because the funding cycle is approaching.

In response to a question about the University Club Foundation Fellowship selection process, Prucha indicated that nominations are pre-screened by Francis, Rettig, and Prucha, and the three top nominees are forwarded to the University Club Foundation for final award selection. Watrous asked whether information regarding candidates is shared with the fellowship and scholarship selection committees. When awards are known, Prucha shares this information with subsequent selection committees.

The consensus of the Council is that the current procedures are working well and they do not need to be changed at this time.

GRADUATE COUNCIL MEETING
December 12, 2002
3:00pm, Kerr Admin. Bldg. 650

Present: Brauner (Chair), Bond, Ciuffetti, Collins, Feller, Fisk, Francis, Pedersen, Prucha, Rettig, Sanchez, Selker, Watrous

Absent: Bird, Markle

Guests: David Sillars, Gordon Reistad, Ken Williamson

I. Approval of Council Minutes

After agreeing that the minutes of the November 14, 2002, Graduate Council meeting did not clearly reflect the decision taken, the Council added a new paragraph at the end of the section on that topic in the 11/14/02 minutes that reads as follows: "To comply with the recommendation, students would be required to include stand-alone graduate credits as a minimum of 50% of all graduate work in their programs of study (exclusive of capstone credits, i.e., thesis, research-in-lieu-of-thesis, or internship.)" The motion to accept the minutes from November 14, 2002, as amended, was passed.

II. Category I Proposal for a Master of Business and Engineering in Construction Engineering Management

David Sillars (Civil, Construction, and Environmental Engineering [CCEE]) introduced the new Category I proposal with a letter of support from Harold Koenig, Chair of the Graduate Program in College of Business. The Department of Civil, Construction, and Environmental Engineering proposes to create the Master of Business and Engineering in Construction Engineering Management. The new degree program is funded primarily through an endowed fund known as the Robert C. Wilson Program in Construction Engineering Management.

The curriculum will consist of approximately 50% graduate level course work in the College of Engineering and 50% graduate courses in the College of Business. Students will be able to choose between capstone activities of an internship or a project, or a degree program of all course work. Working professionals will be the target students; the goal is to improve both business and technical skills. Course work may be completed through both of and off-campus studies. Because selected MBA courses are offered once per week in the evening, the CCEE department plans to offer classes in the afternoon of the same day to minimize students' travel time to and from Corvallis. Another feature of the proposed program is that it will allow the entry of students who do not have a background in engineering so that they can participate in the program and enter into the construction business field. Because those in business and architecture are already employed and active in construction engineering management, this feature will allow them to pursue graduate study without interrupting their careers.

John Selker (Engineering) noted that this program would draw students from very diverse backgrounds. Because engineering and business are both in the title, minimum levels of expertise in these areas should be expected of students. However, little discussion is provided in the proposal about ways that students with limited formal academic backgrounds will be able to meet prerequisites associated with advanced level course work. Sillars responded that students taking business courses will be required to meet all prerequisites for those courses, either before enrolling in the program or as part of the program, and before they take the graduate business courses. The proposal includes the necessary prerequisites for both the business and engineering courses required in the curriculum. To participate in the engineering courses, the program requires three years of experience or work in the field of civil engineering. To Selker's question whether prerequisites for engineering courses were required, Sillars said yes. Ken Williamson (Head of the Civil, Construction and Environmental Engineering Department) noted that this program would focus on a very narrow group of students; most potential students who are interested in this program usually have some background in the area. Williamson also noted that the Civil Engineering department also has stringent requirements for the membership on the advisory committee of each student.

The proposed program would allow the transfer of Portland State University (PSU) courses, but because the program is not a joint-campus activity, only 15 credits of PSU courses could be transferred to the OSU graduate program of study. Martin Fisk (Oceanic and Atmospheric Sciences) asked whether the cost of PSU courses that might be transferred has been investigated. Sillars said that prerequisite courses are available at PSU and that he is setting up a meeting with the appropriate people at PSU to learn more about their MBA program.

Alex Sanchez (Education) noted that the committee that oversees the program does not have any members from the College of Business. He argued that, since the program is closely linked to the MBA program, someone from the College of Business should be on the oversight committee. Williamson said that these are Construction Engineering Management students, but that Business faculty will be on the students' committees. Sanchez said that this does not truly connect the two programs/departments the way the proposal states it would. Because Master's degree students are not required to have a program planning committee meeting, there is no real communication between CEM and Business faculty on the student's committee prior to the final examination. In response to a question about the way that the committee described in the proposal would operate, Williamson answered that the students' programs of study in CCEE are approved by a departmental standing committee by routing the programs through departmental mail; then Williamson signs off on the routed programs.

Bruce Rettig (Graduate School) pointed out that, because this proposal creates both a new degree and a new major in that degree, it is the precursor for a number of new programs coming from the College of Engineering. Rettig also noted that the College of Business is expecting this to be the precursor of several new degrees and the connection with the College of Business should be strong from the start. Sillars stated that this liaison is being established. Fisk emphasized the importance of the Business courses in the program, which suggests Business must be consulted and must be in on the ground floor of the establishment of the degree. Selker asked about the future of the program. Is there a committee that will adjust the program as it matures and evolves? Sillars responded that the Construction Engineering Management program will be

growing and will have the primary responsibility for reviewing course work. Potential changes will also be considered by the Graduate Committee within Civil, Construction, and Environmental Engineering and by industry consultants. Selker suggested that the process of evolution and maturation be outlined more clearly in the proposal. David Brauner (Liberal Arts) asked about expectations of students, since most of them will be non-traditional. It was also noted that the outcome of the Internship is unclear in the proposal, and that it is not clear whether there is a final exam. Sillars stated that, because he expected many students would be sponsored by the company for which they work, internships could result in the student solving a problem for his/her own company. A two-hour final oral exam is required. This examination, along with a final document, which will be presented to the student's committee, would be the capstone requirements for the degree. Tony Collins (Pharmacy) noted that, on page 19 of the proposal, the words minimum and maximum seemed to be interchanged. In response to a question about whether funding has been assured by the College of Engineering, Williamson said that the endowment is being established through the sale of property, but that the College of Engineering is contributing other funds as well.

Lynda Ciuffetti (Science) asked whether Council members were concerned about the potential for conflicts of interest when students do internships at the place of their employment. Brauner also wondered whether an internship in one's own company could really give students the broad and varied experience promised by the proposal. Selker argued that there is a difference between a conflict of interest and an ideal educational experience. As long as a professor can grade a project without any hindrance, there is no conflict of interest. But he felt that the learning experience is less than ideal because there is the potential for a lack of diverse learning possibilities. David Gobeli (Business) suggested that the key is the faculty person overseeing the internship. Faculty must make sure that a meaningful learning experience takes place. Collins asked Gobeli, who has had a great deal of experience with internships, how common conflicts between the faculty and the company are. In particular, who would have the final say as to what the project would be if faculty suggest one topic and the company says that regular work must be done. Gobeli explained that the College of Business has learning contracts, which must be signed before the internship can be started. Wendé Feller (student member of the Council) noted that the internship could increase the student's workload substantially if separate job requirements and internship activities were required. Mary Prucha (Graduate School) pointed out that paragraph b on page 6 speaks to the internship question. Language on that page indicates that four hours of internship are required on student's programs if they choose the internship option.

Feller (GPSA) moved to approve the "Proposal for the Initiation of a New Instructional Program Leading to the Master of Business and Engineering in Construction Engineering Management," provided that the proposal incorporates the changes reflected in the minutes of the December 12th meeting of the Graduate Council." Those changes are:

- 1) In Section 3 "Course of Study," paragraph a, the following sentence must be added, "The topic of the internship will be approved for its academic content by the student's major professor prior to beginning the activity."
- 2) Liaison with College of Business must be established, specifically by way of the committee that approves student programs and program changes.

- 3) Required course work must be clearly outlined in the proposal.
- 4) In addition to recommended changes, the Council also suggests that a liaison be established with Portland State University and the University of Oregon.

The motion as amended passed.

Selker (Engineering) asked that the minutes reflect the Graduate Council's pleasure at the work of this group and the Council's encouragement to continue the good work.

III. Category I Proposal to Move the College Student Services Administration Program from the Graduate School to the School of Education

During the October 24, 2002, Graduate Council meeting, consideration of the proposal to move the College Student Services Administration Program from the Graduate School to the School of Education was delayed due to the inability to understand budget issues in the proposal. The Council passed a motion "that feedback be given to the presenters of the proposal that 1) the Graduate Council is very favorably disposed to this proposal, but, to move it forward with approval, there should be assurance of adequate funding for the program and 2) a liaison document from at least one key client, namely Student Affairs, as well as one other department, should be included in the proposal." Subsequent to that meeting, a letter was sent from Larry Roper, Vice Provost for Student Affairs, to Sam Stern, Dean of the School of Education. In that letter, Roper indicated the support of Student Services for the funding of CSSA and described funding available during the current academic year. The motion to support the transfer of the CSSA program from the Graduate School to the School of Education passed with one abstention.

IV. Graduate Level Learning Actions

a. Catalog Language Update

Prucha was asked at the last Graduate Council meeting to identify what changes in Graduate Catalog language would be required to reflect changes in the graduate level learning requirements. She shared a handout that showed changes in policy for master's and doctoral degrees and changes in program of study requirements. Barbara Bond (Forestry) proposed that the Council consider whether the 400 level courses could be included on graduate programs of study. Rettig pointed out the complexities that could arise from including undergraduate courses on graduate programs of study and suggested that the Council consider this issue as a separate agenda item at a future meeting. Discussion ensued as to whether the Catalog changes include the language that was struck from the minutes of 11/14/02. Consensus that all sentences referring to "the remaining course credits may include the 500-level component of dual listed (400/500) courses" should now be deleted from the Catalog language. Prucha remarked that the Catalog is on-line and the new language might not appear there until Fall 2003. Ciuffetti suggested that the second sentence in the changed Catalog language could stay since it says, "may include." Council consensus was to retain the second sentence at this time.

b. Category II Subcommittee Discussion

Rettig noted that Graduate Council changes concerning slash courses and graduate level learning are having an impact on how the Category II subcommittee of the Graduate Council is doing its work. He asked the Council for feedback for the Category II subcommittee regarding 500 level courses. Selker remarked that a single page description of what satisfies the difference between the 400 level and 500 level courses would be a very useful tool to send to the departments if there is any question whether a Category II proposal meets the graduate level learning guidelines. Fisk noted that the Council had not yet passed the "50% rule" when the Category II proposals were coming in, and because of that, the Category II committee felt the need to enforce the difference between the 400 level and 500 level courses. He believes that Category II proposals now should be much less of a concern. Bond remarked that if a 500 level course shows up on a student's transcript, then the Category II subcommittee should be responsible for making sure that this 500 level course is truly a graduate level learning experience. Selker suggested that, in addition to explaining Graduate Council expectations for slash courses, the policy change regarding "50% graduate level learning" should be communicated very thoroughly to the entire university.

Collins observed that the importance of 500 level courses on the program of study depends on the allowance of 400 level courses on the program of study and the real issue is: "Are we satisfied with the grad students having just 50% graduate level learning or do we want 100%?" Sanchez noted that the confusion arises from three levels of expectation for courses that might be on programs of study: 1) strictly 500 level (i.e., graduate standalone), 2) 400 level course work that might be acceptable for programs of study, and 3) the 500 component of slash courses. Sally Francis (Dean, Graduate School) asked whether, while these issues are being sorted out, practice-as-usual should be pursued or whether new courses should be held to a higher level of expectation. Brauner added that some slash course proposals coming to the Council would not have passed under the OLD policy.

Francis urged all Council members to look at the OSU 2007 work, particularly that work done by the Curriculum Issues Group, since work done by that group may impact work done on this issue by the Graduate Council. She urged Council members to make comments on the Curricular Issues Planning Team report prior to January 15, 2003. Ciuffetti asked whether a comment from the Council as a whole was appropriate. Francis noted that any changes to the curriculum by the OSU 2007 effort would not be affected by the Council unless the Council makes the effort to communicate their own views.

Sanchez reminded the Council that a major source of the concern about slash courses was that student complaints were expressed to the Accreditation Committee. He felt that the slash course issue is being addressed by the Council but only by "the back door." He argued that the Council should continue to be strict in enforcing its expectations for Category II proposals regarding the graduate level learning experience. Rettig described recent actions by Academic Affairs in bypassing the Graduate Council in processing X course approvals, the dropping of old courses, slight changes in titles and prerequisites, and minor changes in course descriptions. The question was whether these actions should be taken solely by the Curriculum Council and bypass Rettig, who has been reviewing them under responsibility delegated by the Council. Rettig asked for

feedback from the Council regarding his role in this decision-making. Sanchez remarked that the Council is losing some control over graduate level learning if it does not have a say in these decisions. Rettig reported that because of the new system on the Web for approving Category II changes to courses, it usually takes only about a few minutes to process them. The consensus of Graduate Council is to have Rettig continue to approve these proposals on behalf of the Graduate Council.

GRADUATE COUNCIL MEETING

November 14, 2002

3:00pm, Kerr Admin. Bldg. 650

Present: Brauner (Chair), Bird, Bond, Ciuffetti, Feller, Fisk, Francis, Markle, Pedersen, Prucha, Rettig, Sanchez, Watrous

Absent: Collins, Selker

Guest: Don Armstrong, Botany and Plant Pathology

I. Approval of Council Minutes

The minutes of October 24, 2002 Council meeting were approved as corrected. Brauner (Anthropology) announced that David Gobeli has been appointed to represent the College of Business on the Graduate Council.

II. Graduate Admissions Standards Task Force Report

The Task Force on Graduate Admissions Standards, co-chaired by Don Armstrong (Botany and Plant Pathology) and Henri Jansen (Physics) was chartered last year by Dean Francis in response to a recommendation from an earlier Graduate Admissions Task Force, which studied admission procedures, and a request from members of the Graduate Council. As noted in the report:

1. The Task Force conducted a survey of the opinions and concerns of OSU graduate study coordinators relative to current OSU graduate admission standards. (The survey elicited a total of 51 responses, representing a majority of the individual graduate programs on campus.)
2. The Task Force surveyed the graduate admission requirements of 20 universities, including peer institutions, other PAC-10 schools, other Oregon institutions of higher education, and several other land-grant universities.
3. The Task Force met with several individuals representing various areas of expertise concerning the application of graduate admission standards at Oregon State University. Individuals interviewed included Michele Sandlin (Director of Admissions), Margaret Niess (Chair, Graduate Admissions Committee), Roy Rathja (Chair, Undergraduate Admissions Standards Task Force), and Deborah Healey (Director, English Language Institute) and
4. Statistics concerning the operation of the appeal process in graduate admissions were obtained from the Admissions Office and reviewed by the Task Force.

Armstrong summarized the findings and the recommendations of the report (see below), which is available upon request from the Graduate School. Substantial information about each finding and recommendation can be found in the report.

Findings

1. Strong arguments exist for maintaining some form of university-wide minimal graduate admission standards, but care must be exercised that such standards do not inadvertently discourage applications from individuals with qualifications and achievements that transcend the narrow definitions of these standards.
2. The graduate admission standards currently employed by OSU are very similar, and in many cases identical, to those employed by most of our peer institutions and by other PAC-10 schools.
3. A majority of graduate program coordinators on campus view the existing graduate admission standards as satisfactory and appropriate, as long as an efficient and reasonable appeal process is available. Nevertheless, some issues of concern have been identified.
4. The current appeal process for graduate admissions appears to be administered in a manner that is generally sensitive and responsive to the needs and judgments of individual programs, but improvements in the process may be possible.
5. The TOEFL exam may be a useful standard in evaluating some aspects of the language skills of international students, but it is an inadequate guide to the speaking and writing ability of these applicants.
6. The requirement for international students to demonstrate adequate financial resources prior to admission occasionally has unintended negative consequences.
7. The so-called "24-credit rule" occasionally causes student hardships that appear to serve no useful purpose.
8. The Undergraduate Admissions Standards Task Force is exploring the possibility of utilizing a set of behavioral essays to obtain additional information pertinent to undergraduate admission and recruitment goals. Some graduate programs already have imposed somewhat similar structure on the Statement of Purpose that is required of all graduate applicants.

Recommendations

1. University-wide, minimal graduate admissions standards should continue to be employed at OSU, and the current standards should be retained as the basis of the graduate admission process; however, some improvements in the interpretation and administration of these standards can probably be achieved.
2. The Graduate School web-site should be revised to give more detailed, specific, and complete information concerning the interpretation of graduate admissions standards as they apply to international students.
3. The language accompanying the statement of graduate standards in the Graduate Catalog and on the Graduate School web-site should be revised to be more welcoming of applications from ethnic minorities and individuals with nontraditional backgrounds.

4A. The restrictions currently imposed on the ability of conditionally admitted students to hold graduate assistantships, to meet formally with their program committees, and to file graduate programs, should be eliminated.

4B. With the recommended change in the restrictions on conditionally admitted students, the primary function of conditional admission would be to ensure that these students are tracked and receive appropriate attention. Therefore, graduate programs should be required to carefully monitor and report on the progress of these students after completion of their first term (12 credits) of work and quarterly thereafter until conditional status is removed.

5. The Graduate School, with the help of the English Language Institute, should monitor developments in English language testing with the ultimate goal of identifying and adopting a standard more useful than the TOEFL scores currently required. In the meantime, recognizing that it may be some time before a more useful language test than the TOEFL is uniformly available at international locations, international applicants should be encouraged, wherever possible, to submit alternative test scores that include evaluations of written and verbal communication skills.

6. The Graduate School and the Office of Admissions should explore ways in which international students who need evidence of admissibility to secure funding could be identified and (with the support of an interested graduate program) provided with appropriate documentation to accomplish this end.

7. To make administration of the “24 credit rule” less punitive, the Graduate School should consider revising aspects of the rule that are under University control.

8. The Graduate School may wish to explore the utility of imposing structure on the Statement of Purpose required of all graduate applicants or to encourage programs to develop such structure if they have particular concerns that are not addressed by the traditional admission standards.

David Brauner (Liberal Arts, chair of the Council) asked the Council whether they wish to adopt the report, critique it or implement the recommendations. Sally Francis (Dean, Graduate School) answered that the Task Force was appointed by her, but the Council should consider adopting or accepting the report, especially with an eye to implementing the recommendations of the Task Force on basic admission standards for the university. Conditional/provisional admission and the 24-hour rule may be particular areas for further analysis by the Graduate Council before a policy change is considered.

Mary Prucha (Graduate School) reported that she already has made changes to the on-line graduate catalog to make the language more welcoming to minority and international students. Rettig will convene members of the Graduate Admissions Committee, the Office of Admissions, the Office of International Education (OIE), the English Language Institute (ELI), and the Graduate School to discuss this and other recommendations that can be addressed without action from the Graduate Council. Items requiring Graduate Council action will be brought to the Council later in this academic year. A motion to receive the report, with deep appreciation to the Task Force, was made, seconded and approved unanimously.

In response to a question about the recommendation needing the most attention, Dr. Armstrong identified concerns about conditional and provisional admission.

Alex Sanchez (Education) asked what kind of quality assurance would be used to measure the intended consequence of more welcoming language to international and minority students on the OSU web site. Rettig responded that he understood the School of Education has been the most interested in finding ways to recruit more minority students, including students who may have cumulative grade point averages below 3.0, but who may have other information that indicates that they would be successful in their graduate degree programs. He suggested that groups who voiced concern about language would be asked to review the web pages and make suggestions about further improvements. Prucha provided an example of changes in language in the current admissions wrapper, but she noted that the language has not been tested and she asked Sanchez for his suggestion of an appropriate group. Sanchez, noting that the concern about minority applicants was not unique to Education but was shared widely across the university, suggested the OSU Association of Faculty for the Advancement of People of Color. Brauner mentioned older than average students as another group of people whose GPA may understate their achievements and likelihood of strong performance at the graduate level.

Brauner noted that the issues of conditional and provisional admission and of the 24 credit rule are related and both should be reviewed by the Graduate Council. Rettig confirmed that the key restrictions placed on conditionally admitted students relate to assistantships and programs of study. Bird explained that the Graduate Admissions Committee often encourages departments to set provisions requiring that students maintain B or better grades on all their courses (that is, provisions equivalent to the standard conditions) when the department expresses an interest in offering a graduate assistantship to students who otherwise would have been admitted conditionally. This procedure has been used to provide a way to avoid restrictions associated with conditional admission. Rettig commented that the intent of provisional admission is to admit students with grade point averages at or above the minimum required for full admission, but who have deficiencies such as lacking prerequisite courses. Bird agreed that some departments are confused about what the Graduate Admissions Committee is asking for in terms of provisions.

After Francis and other committee members suggested that these issues come before the Graduate Council at a later time as specific agenda items, Bird suggested that the Council consider changes to the appeal process as well. Elaine Pedersen (Health and Human Sciences) suggested more attention to the concerns about alternative means of testing for English language skills. Rettig agreed to include this issue in the discussion with staff from OIE and ELI.

III. Graduate Level Learning Actions

Brauner reported on a Council working session, which was held on November 6, 2002. At that work session, Council members discussed possible policies that the Council might adopt to insure that a minimum part of a graduate student's courses be "genuine graduate-level learning experiences." Those who attended that meeting concluded that a policy should reflect the ideas embodied in Recommendation 7 from the recent Accreditation Review Report: "Therefore, the Committee recommends that the University conduct a thorough analysis and evaluation of all bi-

level courses and syllabi and then take appropriate steps to guarantee compliance with the requirement that a minimum of 50% of all courses in a student's program be genuine graduate-level experiences, as articulated in Standard 2.F.4." The draft motion from that group—that OSU comply with this recommendation—was approved.

To comply with the recommendation, students would be required to include stand-alone graduate courses as a minimum of 50% of all graduate work on their programs of study. A motion to this effect was made and seconded. The motion passed.

Last year, action had been taken by the Graduate Council to eliminate the slash course model, but to allow as many as 18 credits of 400 level courses on a program of study. At the November 14, 2002, meeting, the Council discussed whether 400 level courses would be allowed on graduate programs of study under the new policy adopted by the Council or whether this policy would not be needed with the continuation of the slash course model. Martin Fisk (Oceanic and Atmospheric Sciences) reported that the National Science Foundation is encouraging interdisciplinary PhD degrees. Students entering interdisciplinary degree programs will have strong backgrounds in at least one discipline, but may have limited training in others. For example, a student with a strong background in microbiology may need to complete 300 or 400 level prerequisites in an Engineering department. Therefore, Fisk argued in support of permitting undergraduate courses on graduate programs of study. Lynda Ciuffetti (Science) said that she would not feel comfortable with allowing a 300 level course on a PhD program. Fisk reiterated his support for the flexibility of using 300 and 400 level course work on graduate programs. In response to additional concerns from Ciuffetti, Fisk stated that his research indicated that a number of peer institutions allowed 300 and 400 level courses on graduate programs.

The question was raised whether the newly adopted 50% requirement was intended to include only regular courses or to include all courses, including thesis and dissertation. Rettig asked about non-thesis programs which use research, project, or internship courses as capstone activities. Markle (Agricultural Sciences) argued that 50% of regular courses is a very different policy from 50% of all credits. Barbara Bond (Forestry) moved to revise the wording of the new policy to require 50% of credit hours on graduate programs of study be stand-alone graduate courses ("courses" were defined to exclude capstone activities such as thesis, research or project in lieu of thesis, and internship credits). In response to a question about whether the accreditation committee excluded thesis, research or project and internship in their recommendation, Francis indicated that the standard referred to by the accreditation committee does not exclude thesis and research. If theses are not excluded, a master's student in a thesis program could fulfill the requirement for graduate-only courses with few or no regular stand-alone courses.

Fisk observed that the ultimate decision makers in terms of deciding what can be used on the program are the members of the student's advisory committee. Bond argued that this new policy offers incentive for departments to offer separate stand-alone graduate level courses. Francis mentioned that the Department of Exercise and Sport Science offers slash courses in alternate years; the 400 level is offered one year and 500 the next year. She suggested that the 500 component of a slash course is a stand-alone course if it is offered independently of the 400 component, as is done in Exercise and Sport Science. In response to the reminder that advisory committees agree on programs of study, Rettig pointed out that the University does not require

that master's students (except for MAIS students) meet with their advisory committee to plan a program of study. Master's degree programs are approved solely by a major professor with oversight of the department or program chair. Markle and Ciuffetti reported that Fisheries and Wildlife and Botany and Plant Pathology do require committee meetings.

Because slash courses are not going to be eliminated, Brauner asked what the next steps should be for the Council. Sanchez observed that the issue of slash courses came to the Accreditation Committee because of complaints by students. If OSU is to overcome the objections of these students, fewer slash courses and more stand-alone courses are needed; the way to do that is to stop allowing, or at least limit, slash courses on the program. He noted that the Accreditation Committee recommended review of all slash courses. Although the actions being taken by the Council do not imply that all courses will be reviewed, they provide incentives for departments to develop stand-alone graduate level courses.

The Council was concerned about the possible financial impact of this policy change, given the limited resources and competing needs to teach more undergraduate courses. However, the high visibility given to this issue by the Accreditation Report and the other information available to the Council suggests that resolving this problem must be a priority for the University and that finances should follow the priorities. As an example of the challenge, Ciuffetti cited the difficult decision about offering a 600 level course with six students or an additional section of a 200 level course with 700 students; current budget decisions imply that resources follow the larger course enrollment. Prucha asked for clarification about implementing the policy. Brauner asked when changes to the catalog would be made. The consensus was that the policy should apply only to students who enter Fall 2003 or later, and that changes to the catalog be delayed until the time of year that catalogs for 2003-2004 are issued. Markle voiced concern that Fisheries and Wildlife will not be able to meet the new requirements. He used the example that a 45-credit hour Master's (with 12 thesis hours) and 6 blanket hours would require 11 credit hours of stand-alone graduate level credit. The motion to revise the policy by changing courses to credits passed.

The final motion, as amended, reads as follows:

To comply with the recommendations, students would be required to include stand-alone graduate credits as a minimum of 50% of all graduate work in their programs of study (exclusive of capstone credits: thesis, research-in-lieu-of-thesis, or internship).

IV. Other Business/Announcements

Brauner reported that he, as the representative of the Graduate Council, would have an opportunity to meet with the Chancellor and others seeking input on selection of the interim president for OSU. Brauner asked Council members for their thoughts on that selection. Sanchez mentioned that, because it is important to follow up on current initiatives, the person selected should be cautioned against starting new initiatives. Barbara Watrous (Veterinary Medicine) asked whether it was likely that the Provost is most likely to be selected. Brauner reported that some faculty are reluctant to divert Provost White from his current level of involvement with OSU 2007 for other important work that the interim president must do. Francis stated that there

are many off-campus responsibilities that would take the Interim away from campus, including working with the state legislature and financial donors. Legislative support is needed for graduate studies because the current resource allocation model at the state level has been funded at reduced levels for graduate students, implying that a stronger case needs to be made to the legislature about the value of graduate education. Watrous mentioned that a very important skill is working with the legislature.

GRADUATE COUNCIL MEETING

October 24, 2002

3:00pm, Kerr Admin. Bldg. 650

Present: Brauner (Chair), Bird, Bond, Ciuffetti, Collins, Feller, Fisk, Francis, Markle, Pedersen, Prucha, Rettig, Roth, Sanchez, Selker, Watrous

Guests: Tom Scheuermann, Interim Director, CSSA, and Sam Stern, Dean, School of Education

David Brauner (Liberal Arts) introduced Wendé Feller, who was a non-voting student representative for this meeting. Brauner reported that after the Faculty Senate Office processes her nomination, she will be the graduate student representative on the Graduate Council with full voting privileges.

1. Approval of Council Minutes

Sally Francis (Dean, Graduate School) suggested several editorial changes in the minutes of the October 10, 2002, meeting. Elaine Pedersen (Health and Human Sciences) moved that the minutes be approved as corrected. The motion passed.

2. Category I Proposal to move the College Student Services Administration (CSSA) program from the Graduate School to the School of Education

- a. Background information Francis provided a short history of the location of the College Student Services Administration program, stating that most of the background could be found in the proposal. The proposal is to move the program, currently located in the Graduate School, to the School of Education. Francis supported this change, citing the expanded opportunities for the CSSA faculty to interact with Education, as well as the increased opportunities for CSSA and Education students to interact as reasons for the program move.

After Barbara Watrous (Veterinary Medicine) suggested that parts of the proposal included more than just moving the program to the School of Education, she asked if the move would also address these proposals. Francis explained that her endorsement of the proposal related only to the move and that she did not take a position on any of the other issues in the proposal. Watrous asked what would happen to the rest of the proposal if the move was approved. Francis said that Tom Scheuermann (Interim Director of CSSA) and Sam Stern (Dean of Education) have not given an indication of what would happen to the rest of the proposal if only the move was approved. Brauner asked whether the council should consider issues of funding. Francis said that the Budgets and Fiscal Planning Committee would look at this proposal, but typically that happens when the proposal goes to the Curriculum Council. Alex Sanchez (Education) said that budget considerations were not usually a part of the deliberations by the Council when Category I proposals have been voted upon. Rettig pointed out that when the Master of Public

Policy Category I Proposal went forward, the question of new resources was brought up and that question did become an issue in the creation of the degree. The question then is whether the quality of the CSSA program will suffer if the resource needs identified in the proposal are not addressed as part of the move. Linda Ciuffetti (Science) pointed out that there are many parts to the proposal, and asked whether the Graduate Council would be endorsing the budget needed to fulfill the proposal by approving the proposal to move it.

- b. Visit with CSSA/Education Sam Stern (Dean, Education) began the discussion by focusing on the current situation of the School of Education as a new school by describing the current programs: early childhood/elementary education; secondary teacher education; adult education; community college leadership; counseling; and 4-H youth development education. Stern feels that these programs provide a focus that is highly complementary to the CSSA program. He pointed out that CSSA began in Education in 1966 and that several CSSA faculty hold current appointments in the School of Education. CSSA has reported to the Graduate School for only approximately 12 years. The majority of students in CSSA also take Education courses. Their programs of study frequently require them to study under the direction of Education graduate faculty members. Students will benefit by attending classes beyond those that they currently select. Stern is excited about having CSSA join Education, as are faculty and students in Education. Adult Education and the Community College Leadership programs are especially excited about having CSSA as part of Education and have been visiting about common work.

Tom Scheuermann (Interim Director, CSSA) distributed a CSSA program highlight sheet for Council members, showing what CSSA is currently doing. Scheuermann reported that he and Stern have been working on ways that CSSA could work within Education and he reported that the physical presence of CSSA in the School of Education is working well. Scheuermann said that parts of the proposal solidify a master's program that is already in place and that the proposal seeks to accomplish currently articulated goals. There will be a part-time curriculum for those who are looking for that opportunity, and it is possible that the CSSA program could develop new graduate certificate programs. Another goal of the program is to re-establish the PhD degree. The primary rationale for the proposed change is to enhance the academic standing of the program. Whether the PhD program is re-established or not, Scheuermann would like the master's degree program to be top-tier, and he wants OSU's program to be at the top of the list for those considering CSSA as their major. The move to the School of Education would help CSSA attain that goal. The program currently includes one full-time faculty member, and about 10 volunteer faculty members who bring their administrative experience to the program. Most CSSA students have teaching assistantships; most graduate in two years; and most go on to be hired directly out of the program.

John Selker (Engineering) asked how the move would change the resource base and the faculty work load. He also asked about the current demand, the rejection

rate among applicants, and the quality of students seeking admission to the program. And, he asked Scheuermann whether he would be willing to separate the resource questions from the question about the location of the program. Scheuermann replied that the principal issue is moving the program into the School of Education academically. The plan is to solidify the program before seeking further growth. Available data on demand for the program shows that it can grow when this is desired. In recent years, the entering class size has been higher than normal (20 to 25) and the caliber of students is particularly strong. In no case was someone admitted who was not very well qualified. Selker asked whether the budget figures were for solidification of the program, rather than the move. Scheuermann replied that budget figures were just for solidification, it would take no budget adjustment to actually move the program, but the program needs at least two full-time faculty members even if it stays as only a master's degree program. Selker asked if that would be true even if CSSA stayed in the Graduate School. Scheuermann said yes. Faculty would be expanded before student numbers would be increased. Stern said there were two questions, one regarding funding and one regarding the move. Currently most of the funding for the CSSA program comes from two sources: Student Affairs and the Graduate School. Student Affairs funding is projected to continue and would normally pay for one faculty member. Irrespective of issues of growth, a sustainable program would require the funding provided by Student Affairs.

Brauner asked whether the Graduate School funding goes with CSSA if it moves. Francis said that funding from the Graduate School would move with the program, but the Budget Allocation Model may change how this funding would be allocated to CSSA. Because most CSSA students have assistantships, it is easy to see how CSSA students have enriched the campus. Francis pointed out that Roper and Francis are committed to funding CSSA, but the new Budget Allocation Model does not give the Graduate School any funding for the programs housed within the Graduate School. Selker suggested that the proposal be clarified to include language showing that the funding is to sustain the program, rather than for growth. Stern replied that he charged the task force working on this proposal to consider how the program could expand, how funding could be stabilized, and what amount of resources would be required for the CSSA to both remain viable and to grow.

Martin Fisk (Oceanic and Atmospheric Sciences) asked whether there was one FTE faculty member in CSSA. Scheuermann replied that Jessica White is 1.0 FTE and her salary is paid by Student Affairs funds. Scheuermann has a .15 CSSA FTE and a .85 University Housing and Dining Services FTE. CSSA had also been supporting a clerical person but currently that work is being done by new volunteer faculty who are also teaching one course per year. What would be different is that within the School of Education, there are faculty members who will have interaction with these CSSA students. Scheuermann stated that the equivalent of 2.0 FTE needs to be committed to the program in addition to the volunteer faculty CSSA now has. Most volunteer faculty members see the course they teach as an enhancement of their time on campus.

Scheuermann asked whether there was anything else the CSSA needed to provide to the Graduate Council for their consideration of this proposal. In response, Selker asked whether the department had prepared any liaison documents showing conversation with other campus units or other programs within the Oregon University System (OUS). Scheuermann reported that informal conversations have taken place, but nothing official, such as liaison documents, were prepared as a result of those conversations. Selker suggested that CSSA send out the Category I liaison email to be found on-line. Francis reported that since there are no other CSSA programs in OUS, it was thought that a liaison document was unnecessary. Selker suggested that if both Student Affairs and the Graduate School furnished letters of support, it would strengthen the proposal, especially if budget was involved. Francis is a signatory to the proposal.

- c. Council discussion and action Brauner noted that there seemed to be a big jump in the budget requested after the move, but it is easier to support the requested budget if that figure is for both the maintenance and the growth of the program. Selker noted the increase in FTE of faculty and stated that it would help if that were made clearer in the proposal. Selker said he was impressed by the program's productivity. Brauner asked whether it was appropriate for the Graduate Council to ask for a re-write of the proposal to separate the requested new resources for growth in the program from the actual move to Education. Francis answered that a revision would certainly be appropriate, whether the money is new, old or a mix. She also noted that the Graduate Council is also able to vote on re-organization and opt out of taking action on the rest of the proposal. Doug Markle (Agricultural Sciences) asked whether it was appropriate to just act on the move, and not on the requested budget. He said that the move has positive aspects for graduate education, but if financial resources are not available, he questioned whether the program would benefit from the move. Brauner noted that the proposal should state that CSSA does not want to lose money by moving.

Watrous pointed out that the program is supported by non-tenure track faculty, and wondered if that made the program too unstable. Brauner answered that CSSA is more of an applied administrative program and that two full-time faculty seems to be the norm, even though that seems very small for most programs. Sanchez pointed out that the CSSA program has been stable since its inception, in spite of the way it is structured. Ciuffetti thought that all the funding mentioned was new money, but that, because the document is not clear on that point, it is reasonable to ask for clarification. Selker noted that the Graduate Council was using anecdotal evidence to paint a portrait of a successful CSSA program. Barbara Bond (Forestry) suggested that rather than new money or old money, perhaps the terms that should be used were soft money and hard money. Perhaps this can be seen as a move from soft money, where faculty members and program administrators must find new money each year, to hard money, where the hunt for funding is no longer needed. Feller reported that in her experience CSSA is a very strong program, and there are students from all over the country in the OSU program. CSSA students feel that Education should be their academic home.

Francis indicated that, in the new Budget Allocation Model, hard money would be based on credit hours generated just as for any other academic program. Francis stated that none of the Graduate School 2002-2003 budget is based on credit hours taken by students in interdisciplinary programs housed in the Graduate School. If CSSA moves to an academic unit, then money should follow the program. In response to Markle's question about where the money goes now, Francis responded "nowhere." Brauner said that the Graduate Council would like clarification about money and where it is coming from. Selker thought that the CSSA faculty were arguing that they needed a fixed amount of money. Markle said that asking them to show a budget for this year and next year would not be helpful. Fisk wondered if it is still fair to ask where their money is coming from and whether there would be any new money for next year. Selker remarked that that question is beyond the scope of the Graduate Council. Fisk replied that the question of money speaks to the stability of the program. Selker again asked for liaison letters and Brauner asked for letters of financial support. Consensus of the group was to defer action, asking for a liaison letter.

Sanchez moved that the Graduate Council "approve the move of the CSSA program from the Graduate School to the School of Education with the understanding that we make no recommendation as to the funding of the program." The motion died for lack of a second. Feller asked whether this wording would cause budget problems for the program. Selker asked for a deferral of the vote pending receipt of more information regarding funding. Brauner pointed out that more information sent now to the Graduate Council could speed the proposal at a later point. Bond asked whether the Graduate Council usually discussed the merits of the growth of a program. Francis said that typically that would happen at a program review, not as part of a Category I proposal. Rettig pointed out that if the quality of graduate program is affected by funding then it is within the purview of the Graduate Council. Selker moved that feedback be given to the presenters of the proposal that 1) the Graduate Council is very favorably disposed to this proposal, but, to move it forward with approval, there should be assurance of adequate funding for the program and 2) a liaison document from at least one key client, namely Student Affairs, as well as one other department, should be included in the proposal. The motion passed.

3. Program review guidelines (Francis) Francis highlighted the changes in the program review guidelines that are being proposed. She reported on the past history of program reviews and observed that, in the past, there was little attention to the outcomes of the programs. She is suggesting that an external reviewer be added from those hiring graduates of the reviewed program. Another change is for the department head or program leader to bring a plan of action to the meeting with the Provost. Francis pointed out that deferring intensive review procedures is also a possibility in the new guidelines. Brauner asked whether the statement on ethics had been included. Francis pointed out that it was included on page 9 under curriculum, "academic and research integrity."

Council members asked for clarification on several specific points and made suggestions for improvement of the program review guidelines. All proposed changes were accepted by Francis. A motion was made to accept the document with minor changes noted, with appreciation to Sally for the hard work done. The motion passed. The new guidelines will be effective for the 2003-2004 graduate program reviews, and will be shared later this year during workshops for future year graduate program reviews.

4. Graduate Level Learning Actions Last year's (2001-2002) Graduate Council asked that action to address concerns about slash courses (courses offered for 5XX credit and 4XX credit at the same time and location) be carried forward to this year's (2002-2003) Graduate Council. Francis researched the 2001-2002 Graduate Council and Curriculum Council minutes to document past consideration of this issue. The recent accreditation report included a recommendation concerning slash courses. Prior to that, a task force on Graduate Level Learning also worked on this issue. During program reviews, graduate students report that slash courses do not work for them. The Graduate Council took one action during 2001-2002, but it no longer stands because the Curriculum Council did not accept it.

The accreditation standard is that 50% of work on graduate programs must be graduate level work. Genuine graduate level is most conveniently delineated by course numbering, but the accreditation team heard a report from students that slash courses are not "genuine graduate level learning." In response to the question whether there are any units on campus that do not have 8 "stand-alone" credit hours of genuine graduate level learning, Francis replied that there were (the number 8 was discussed because departments can offer up to 12 credits of thesis and another 6 credits of blanket courses in a thesis MS/MA degree; thus requiring only 8 additional credits of stand-alone courses to meet the standard that more than 50% of the program of study credits be stand-alone graduate). But, she asked whether there is any reason why the department cannot find a way to offer the necessary graduate-only credits. Also there may be ways to draw on courses from other departments. Curriculum Council discussion on the proposal to use 18 undergraduate-level credits on graduate programs of study focused on quality of graduate programs.

Brauner asked, "Do we still like what we did last year?" Selker asked whether there needed to be a liaison between Curriculum Council and Graduate Council. Francis said that the Graduate Council could adopt the policy requiring 50% of credits on a program of study to be stand-alone graduate credits; this would not affect the University numbering policy. The previous problem was with the interpretation of what the Graduate Council had proposed. The Curriculum Council understood that the same course would be taught at the same time and in the same room, and wondered what would be different from the current slash course model. The prior proposal was to eliminate slash courses, and departments were not understanding that they could use 18 credit hours of undergraduate courses on graduate programs of study. Sanchez suggested that Curriculum Council would probably have no comment on this proposal, primarily because it simply answers the accreditation report.

Markle observed that one of the points made last year, but missing from this document, is that the content of a program of study is decided by the graduate student's committee. He suggested that 18 credit hours of 4XX can also be 4XX/5XX, which would limit slash courses to 18 credit hours as well. There was no consensus on this point. Markle would like to see that "stand alone graduate level work" is spelled out. He suggested the change that no more than 18 credit hours can be 4XX or 4XX/5XX credit hours.

Bond said that the policy up for discussion would put students in a bind. Current students told Bond that they were signing up for slash courses because there were not enough 500 stand-alone graduate courses. She argued that the Graduate Council should look beyond requirements for programs of study and find some way to insure that graduate-only courses are available for students to take. The original policy would have forced departments to create 500 level courses for students to take; this policy would not. Tony Collins (Pharmacy) wondered whether students did not look closely enough at programs to see that courses are not being offered. Bond voiced her concern that recruiters are not being honest about what the University has to offer in the way courses are provided. Selker said that the policy proposal in front of the Council does not address the problem with OSU and its ability to offer enough courses at both undergraduate and graduate levels. The new policy proposal is to allow 18 credits of undergraduate courses, not 18 credit hours of slash courses. This constraint will only make providing courses more difficult, and it will not improve the quality of the graduate experience.

Ciuffetti wondered whether the accreditation team would really accept 4XX level course work on a PhD program of study. She stated that she would support the idea that the student's advisory committee is the final arbiter of the content of student programs of study. Brauner suggested that this agenda item be placed on the next meeting agenda. Francis said that the accreditation team suggested that campus should do a study of the slash course situation and that a review of the syllabus of every slash course be conducted to verify genuine graduate learning. Sanchez pointed out that those on Category II proposal committees know how difficult it would be to review each slash course.

The meeting adjourned at 5:05.

5. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, Nov 14 th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, Dec 12 th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, Jan 9 th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, Jan 23 rd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, Feb 13 th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, Feb 27 th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, Mar 13 th	3:00-5:00pm	650 Kerr Admin. Bldg.

Graduate Council

June 11, 2002 Minutes

Present: Remcho (chair), Brauner, Collins, Cull, Ebbeck, Fisk (by phone for second item), Francis, Markle, McNair, Prucha, Rettig, Watrous

Absent: Caughey, Mishra, Radosevich, Sanchez

Guests: Sherm Bloomer, Dean, College of Science; Irma Delson, Co-chair, Physics review team; Steve Esbensen, co-chair, Animal Science Follow-up review; Henri Jansen, Chair, Department of Physics; Steve Tesch, co-chair, Animal Science Follow-up review; Sue Tornquist, co-chair, Counseling follow-up review.

1. Approval of Council Minutes

The May 23 Graduate Council minutes were approved as written without dissent.

2. Physics Review Report

Paul Cull (Engineering) introduced Sherm Bloomer (Dean, College of Science), Henri Jansen (Chair, Physics Department), and Irma Delson (co-chair, Physics Review Team). Cull noted two difficulties with the program review process: (1.) Jansen stated that he was unaware that the review included both undergraduate and graduate programs and (2.) many faculty members of the Physics Department were apparently unable to contribute to the self-study.

Cull noted that the graduate program had serious problems and that the PhD program is in real jeopardy. First, currently there are 31 or 32 graduate students in department, but only 15 faculty. Many of the faculty are at or nearing retirement age, and there has been only 1 new faculty hire in 10 years. Second, the funding level budgeted per student credit hour is 49% of the average per student credit hour of peer institutions. The last review of the Physics graduate program (1987) recommended a full external review of the department, but such a review never happened. The current report repeats that recommendation. Cull outlined the rest of the recommendations included in the report.

Martin Fisk (COAS) was also on the review team, and he noted the difficulty the team had in reviewing the self-study because it was delivered less than one week prior to the review. Additional material given to the team at the review was also difficult to review in a timely manner.

Jansen then responded to the review report. He noted that a recent external review rated the department as one of top 25 promising physics undergraduate programs in the nation. The number of physics graduate programs nationally is going down, as is demand for them. In the short term, the OSU Physics department is expecting growth with fourteen new graduate students coming in the fall. Typically, the national and OSU trend is for 1/3 of new graduate students to pursue a PhD, 1/3 to pursue an MS, and 1/3 to be lost through attrition.

Jansen addressed the recommendations in the report. Following are his responses, with numbers that correspond to the numbered recommendations in the report (pp. 4-5).

2. A departmental strategic plan is in the works.
3. The department plans to hire more faculty when possible.
4. The report focused only on one large service course, Physics 211. Other service courses (e.g. 201) have

been greatly improved. Jansen admitted that the department did not adequately supply the team with information about the successes of some service courses. The department is working on improving Physics 211 through an alliance with Science and Mathematics Education.

6. Jansen acknowledged the outdated facilities in Weniger Hall.
7. The department has applied for an NSF grant to do a workshop to share the success of Paradigms with other institutions.
8. An alumni survey is a good idea, and he will contact Engineering to get pointers because that college has had experience with such surveys.
9. Demographically, the department is above average in its numbers of women and minorities, but the national average is very low. There are very few African American students in Physics nationally.
10. Undergraduate access to the departmental library is important, and security issues needed to be worked out. Jansen did not anticipate problems with finding solutions to International Degree obstacles.
11. Jansen agreed that convening the department and graduate students on a more regular basis was a good idea.

Jansen urged the Graduate Council to consider the department's problems in a national context. He noted that the department is working on a professional master's program. The department has been trying to increase the number of graduate students to 40-45, and would like to sustain such a number. Both the number of applicants and the percentage of applicants choosing to matriculate have been restricted by the number of faculty nearing retirement and the quality of the research facilities. Jansen also pointed out the interdisciplinary nature of much of physics research, while he noted little overlap with other departments' courses.

Sherm Bloomer commented about the report and the department. He commended the department for its accomplishments despite limited resources, but he acknowledged its problems. Bloomer did not expect to be able to hire more faculty in Physics; doing so would mean taking those positions from other departments in the College of Science. The College cannot sustain PhD programs in all its departments with the resources currently available. All of its programs are essential to a land-grant university, so Bloomer is in a very difficult situation. He predicted more similar problems as the current budget situation continues, and he encouraged the Council to take the problems of the Physics department as a broad message.

Sally Francis (Dean, Graduate School) said the Graduate Council has not established any hard guidelines or numbers for critical mass of faculty FTE for a department or program. David Brauner (Liberal Arts) wondered if a degree program might be ended because it is unable to carry out what it committed to in its original Category I Proposal. Remcho (chair, Science) noted that the Graduate Council has the authority to make recommendations but not to fold a program. He warned of the possible faculty attrition if Council recommended suspending or ending a program.

Jansen noted that the department has been exploring restructuring in the past few years. He noted that the graduate program is essential to the quality of the department and all its programs.

Bloomer, Delson, and Jansen left. The Graduate Council discussed their dismay at the information in the report and mused about the future of the program, but Remcho recommended focusing on the report itself and leaving recommendations about critical faculty to student ratios for next year's Graduate Council. Delores McNair (student) asked about external funding, and Cull answered that it did not seem to be a concern. Research funding has decreased, but the department is getting more funds from teaching initiatives.

A motion was made and seconded to accept the report; all approved.

3. Animal Science (ANS) Follow-up Report

Steve Esbensen and Steve Tesch conducted this follow-up review and were present to present the report. Esbensen said that the department had come up with a very specific strategic plan since the review, which was attached to the follow-up report. The department acquired 3 new faculty members, all of whom were doing very well. They are having difficulty finding students to work with extension

faculty, but are making progress. ANS intends to eliminate slash courses over the next few years. They have begun interdisciplinary instruction in nutrition and basic physiology. ANS has decided not to expand its companion animal program and to improve its equine program instead. Avian studies will continue to be a major focus. ANS wants to increase its graduate enrollment to 40-50 students, and it plans to convert one faculty position to fund GTA appointments. It is working to develop 12-13 hard-dollar funded .5 GRA's (one per faculty member). ANS has been advertising and recruiting more aggressively and will contact top graduating seniors to come to OSU. Tesch added that ANS has been thoughtful about allocation of resources and strategic planning. Esbensen noted that ANS does not have any huge budget problems looming, but may have to postpone some projects in the face of budgetary problems.

After Esbensen and Tesch left, a motion was made and seconded to accept the report as submitted and all approved.

4. Counseling Follow-up Report

Sue Tornquist joined the meeting to present the report of the follow-up review, which was held on May 15. The reviewers met with Sam Stern, Gene Eakin, and Cass Dykeman. She noted the new administrative structure of the School of Education, and said that a new vision statement has been written since the organizational changes took place. The program has had significant turnover in faculty (lost 3, gained 2), but the current faculty seem close-knit and work well together. Faculty members never received copies of the original Graduate Council review report. Tornquist summarized the findings of the follow-up review in detail. She said that the program appeared stronger than it was two years ago and it is increasing its role within the university.

The Graduate Council asked about teaching loads, and Tornquist noted that, due to reliance on adjunct faculty, it has not increased with the decline in faculty numbers. Currently there are five faculty members. At the time of the original report, there were 60 master's students and about 12 PhD students. There was some discussion about the statistics course the program developed and the general need for applied statistics courses across campus.

Tornquist left. A motion was made and seconded to accept the report as submitted; all approved.

5. Category I Proposal to rename Human Performance graduate degrees

Vicki Ebbeck (Health and Human Performance) presented the proposal. Before the creation of the College of Health and Human Science, the department of Exercise and Sport Science was housed in the College of Health and Human Performance. "Human Performance" is no longer a part of the college name, so EXSS wants to change the degree name so that it matches the department. The two degree names do not have any significant difference in meaning. A motion was made and seconded to accept the proposal; all approved.

6. Category I Proposal to create a School of Electrical Engineering and Computer Science

Brauner suggested the Graduate Council not take an official stand or make formal recommendations at this point. There was general agreement on the following official response: It is the Graduate Council's understanding that a new draft proposal will be submitted in the Fall of 2002, and until that proposal is received, the Council will limit its comments to the May 23 minutes. A general recommendation is that the parties involved in the proposal be very clear about process that resulted in the written proposal.

7. Program review guidelines

Discussion about program review guidelines focused on next steps to take. Changing to new guidelines will require some advance notice for programs with upcoming reviews. Two suggestions for changes to the program review guidelines included possibly asking the departments to submit a budget, and asking that departments formulate their own recommendations in the self-study report. Council did not take action on the guidelines, but there was general agreement to put the item on the agenda early next fall. Revisions will be available for programs to use after that time.

8. Update on Future Activities: Summer Procedures and Overview of 2002-2003

Summer Council activities

- One program review (toxicology) will take place in September
- Fisk will work with Bruce Rettig (Associate Dean, Graduate School) on Category II proposals
- If there are student grievances, Francis will contact Graduate Council members to serve on grievance committees
- Approval of June 11 minutes will take place via email

Graduate Council

May 23, 2002 Minutes

Present: Remcho (chair), Brauner, Caughey, Collins, Cull, Ebbeck, Fisk, Francis, Markle, McNair, Prucha, Radosevich, Rettig, Sanchez, Watrous

Absent: Niess

Guests: Mike Quinn (Department Head, Computer Science); Terri Fiez (Department Head, Electrical and Computer Engineering); Gordon Reistad (Department Head, Mechanical Engineering, representing College of Engineering); Jack Walstad (Department Head, Forest Resources); Scott Reed (Associate Dean, College of Forestry); John Bliss (Forest Resources)

1. Approval of Council Minutes

The May 9, 2002 Graduate Council minutes were approved as written.

2. Electrical and Computer Engineering (ECE) Program Review Report

Doug Markle (Agricultural Science) presented the report from the April 15 review. Terri Fiez (Department Head, ECE) was present to answer questions. The last review was in 1987. In 1995-6, there was a large exodus of faculty, so there was no review in 1997. Markle read major points of commendation and recommendations from the report.

Council members had the following comments and questions:

- David Brauner (Liberal Arts) wanted to see more specific numbers of FTE and graduate students by degree.
- Paul Cull (Engineering) noted that some percentages were not accurate in the report, and Fiez indicated she would fix them.
- Steve Radosevich (Forestry) noted that one recommendation was to tie admission to financial support. Fiez noted that usually a small percentage of those who are admitted actually matriculate, but an unusually large percentage matriculated last year, including many students without financial support.
- Vince Remcho (Chair, Science) asked why the website included faculty members no longer in the department. Fiez said none of them had officially resigned and, thus, could not be removed.
- Radosevich asked if the department utilized adjunct professors. Fiez indicated that only departmental faculty teach courses and direct students; the reason for this policy was concern about both teaching quality and budget constraints. Adjunct and courtesy faculty do serve as members of students' advisory committees.
- Cull asked about outcome measures. ECE does not currently track alumni right now, but Fiez believes that many of them go to industry.
- Cull also asked about evaluation of teaching programs, which were not discussed in the report. Markle said the review team asked the students if they felt the classes were preparing them well. The Graduate School sends a survey to all currently enrolled students, and also collects Exit Survey data. Cull would like to see quantified data in the report.

Since the Category I proposal to merge the Computer Science and ECE departments also involved Terri Fiez, the Council moved on to that item before further discussion. Radosevich moved to accept the report with the following additions:

- Graduate Student Survey results

- Faculty member numbers (historical numbers, hires, intents to hire)
- Number of students in each degree track
- Changing "Kerr Library" to "Valley Library"

Cull noted that he was not happy with the report, which he considered to be incomplete. He could not see evidence of faculty involvement in the self-study, and feared a lack of trust in the department. Markle replied that the review team had observed that faculty and students were happy.

The motion to accept the amended report was seconded, and none were opposed. The amended report was accepted.

3. Category I Proposal to create a School of Electrical Engineering and Computer Science

Fiez presented the proposal, which is to combine two "very strong" and quite large departments [Electrical and Computer Engineering (ECE) and Computer Science (CS)] to create "one really powerful unit." Currently, OSU has the 23rd largest College of Engineering in the nation. Fiez's research found 15 schools across the nation (including UC Berkeley, Harvard, Michigan, MIT, and Vanderbilt) that have a similar structure.

The motivating factors for the proposal include:

- The College of Engineering's quest for top 25 ranking.
- Overlapping areas between ECE and CS. Merging would promote collaboration between faculty. (Some research-oriented faculty in CS initiated the proposal with such collaboration in mind).
- Ability to recruit top faculty. In the past, some faculty did not fit cleanly into either department but would fit very well into a merged school.
- Timing issues, including Mike Quinn's decision to step down as head of CS and the plans for a new building in 2 years for the College of Engineering, which will house both units.

Fiez outlined the changes in the organizational chart and personnel and the impact on other units, the budget, course offerings, advising, and the educational experience. All of these are outlined in the proposal. Plans are to collect faculty into groups that can create clusters of related classes that will be good for graduate students and good for research collaboration. The proposal also contains a list of "pros" and "cons" to the merger.

Fiez noted that, in general, the ECE faculty is in favor of the merger, while there are some CS faculty members who are opposed. There were conflicting opinions reported about the level of support for the proposal in CS. Gordon Reistad (Associate Dean, College of Engineering) recalled from college leadership meetings that the majority of CS faculty supported the proposal, but Cull believed that a minority of CS faculty supported the merger, according to polls taken. Mike Quinn (Department head, Computer Science) said there never was a vote, but the most complete polls say there are more faculty, staff, and instructors opposed than in favor, with some neutral faculty members. Were a complete poll taken, Quinn speculated that a simple majority (not a strong majority) might support the merger, but he was unsure. Quinn further explained that numerous CS faculty members strongly favor the merger, and numerous faculty members strongly oppose it. Many fall between. CS faculty members were offered an opportunity to give input, but did not have a real vote. Fiez reiterated that those who initiated the proposal were in CS, and were three of CS's most productive researchers and great instructors. They were not happy with where things were in their department. Fiez acknowledged that there would be an acclimation period for some faculty members, but she believed that they would come together in time.

Reistad offered a view from the College of Engineering. The college leadership group discussed the proposal, and the College sees it as an opportunity to move forward and try something new. A large faculty group is in favor of it. Some other prestigious programs work with the same model. Very high upside, relatively little downside.

Quinn noted that he believes it can work and the resulting school would be very powerful and successful. He noted that merging does not guarantee success or Top 25 ranking, and it could be an impediment. Quinn also pointed out that there are some differences in culture and environment in the two departments. CS has a culture of collective decision-making, and he would personally be sad if that culture would be lost. Brauner wondered why the culture would be lost, and Quinn replied that since ECE's department head would be the director of the new school, it is very likely that the culture in ECE (which is unlike that in CS) would prevail in the new school.

Delores McNair (student member of Graduate Council) asked how the merger would help ECE respond to the

recommendations in the ECE program review. Fiez replied that the two faculty groups would work together to form strategies concerning faculty, recruiting, and areas of research. The new school may attract Ph.D. students that they cannot currently attract. Remcho wondered about the appropriateness of the goal of attracting more Ph.D. students given the current market trend in which PhD's in CS and ECE are typically only useful for those pursuing an academic career, while many more MS and MA students are recruited by industry. Fiez acknowledged that there is a larger market for master's students, but that there also is a good market for doctoral graduates. She said that the goal would not be for a drastic increase in Ph.D. students. Both departments currently have relatively low numbers of Ph.D. students.

Brauner asked about the teaching/advising loads in both departments. Fiez initially responded that they were similar, but Quinn corrected her, saying that teaching loads in ECE are higher than in CS. Advising loads are similar. There are no plans at this time to shuffle teaching assignments.

Brauner asked how many CS students come in without financial support. Quinn answered that at least half come in unsupported.

Sally Francis (Dean, Graduate School) stated that her concern was about the impact on the educational experience. The proposal states that the primary impact would be on the educational experience at the graduate level. Francis believes that a great proportion of the challenges of mergers affect faculty and graduate students instead of undergraduates. When contentious issues arise between faculty, graduate students can be pulled into debates because they work so closely with their mentors. Francis noted some tension and disparity in the points of views of the two departments. She wondered what the college was prepared to do to facilitate a real transition for faculty and graduate students. People involved actually grieve for what they have lost, and it is possible that they may need counseling. Moving to a new culture would be very difficult. One concern was about the proposed school's promotion and tenure committee. Francis asked Reistad what help or support there would be to make the merger successful. Reistad said that the college will be supportive, and realizes that they must respect different culture in both areas, but they cannot have different cultures in years down the road. The College would make a concerted effort help to make it a success. Their help would come in the form of open dialogue and willingness to listen to concerns, but they would not simply increase funding to the new school as a form of support.

Radosevich found the proposal difficult to evaluate because it lacks specificity. It might have an impact on course offerings and programs, both of which are addressed very vaguely in the proposal. Courses are not specifically mentioned, nor number of courses being affected. Fiez explained that such changes would depend on who is on the faculty at the time. Radosevich would at least like to see a list of the courses that overlap between the current departments. He felt that the Category I proposal is premature and it does not give enough guidance for the formation of the school. Fiez explained that they were advised to do a short proposal. Fisk noted that the paragraph in the proposal addressing the impact on educational experience is very short, and that is what the Graduate Council is concerned with. Perhaps if there were greater unanimity between faculty, it would not be as important.

McNair would like to see more information about leadership that will bring units together and reduce tension. While that may not normally be part of this sort of proposal, it would be important to see how that would happen.

Alex Sanchez (Education) wondered if the two departments being in the same building might cause many of the synergies that those creating this proposal desired to happen regardless of the merger? Fisk agreed that some of these things could happen regardless of whether they are merged. Fiez noted that part of the advantage of the merger was external and related to how the school was viewed by industry and potential faculty and students.

Fiez believes that the culture in ECE has changed a lot in recent past, and CS has recently hired 5 new faculty, which will change that culture. She noted that when she first arrived, there was a difficult process of acclimation. She believes there is an environment of trust in ECE, and that the environment is collegial. She acknowledged that there would be challenges, but believes that the whole will be greater than the sum of the parts.

Reistad addressed the issue of course offerings and primary impact of merger on student experience. Course offering changes will be evolutionary changes that will happen gradually. Initially, there will be relatively little impact on course offerings. A big write-up on course changes would be artificial, and could change greatly depending on what faculty will be brought in.

Quinn noted that it is difficult for him to be objective. He believes that intellectually it could work, but he is

concerned about people feeling like they have not been involved. He has sensed that some faculty would be inclined to leave. He said he was speaking for himself and he knows there are other people who feel the same sense of loss.

The Council provided reaction to the proposal but did not indicate specifically what they wished to see included in a revised Category I. The Council did not indicate if and/or when they would revisit the existing proposal for further discussion and/or action.

4. Forest Resources Program Review Report

Barbara Watrous (Veterinary Medicine) summarized the report, which had been distributed to Council members. Jack Walstad (department head, Forest Resources) responded to the report and the recommendations as follows:

- Recommendation: Replace fixed-term faculty with tenure-track positions.
Response: The demographics of the faculty are a result of annual declines in budget support. Fixed-term faculty members were hired to maintain programs. There are four tenure track vacancies in the department, and the budget is still difficult to meet.
- Recommendation: Increase faculty diversity.
Response: Walstad has hired 6 males, 7 females, and 2 minorities in his 12 years. The department will continue to make a concerted effort toward diversification. Out of the core faculty, 5 hold OSU PhD's, 2 hold OSU Master's, 2 hold OSU Bachelors, so Walstad believes the faculty is adequately diverse in terms of educational background.
- Recommendation: Increase graduate course offerings (reducing slash courses)
Response: The department is in the process of trying to reduce the number of slash courses, and has just decided to eliminate 4 500-level components.
- Recommendation: establishing graduate student recruitment program
Response: Recruitment of graduate students is an area of keen interest. Currently, there are 35 graduate students (2+ per faculty member).
- Recommendation: increasing graduate student stipends
Response: Departmental stipends provide a base salary for graduate students, and exceptional students' stipends are enhanced with fellowships.
- Recommendation: increasing computer access for graduate students
Response: It costs \$1200/year to support a computer in the college, and there are security issues with allowing students to hook up their own computers. The department offers a common laboratory with state of the art computers and software.

Radosevich was surprised to see a recommendation about lowering barriers between Forest Science and Forest Resources. Walstad noted that those recommendations should apply to undergraduate level. The report should be amended because it says "graduate level."

Martin Fisk (Oceanic and Atmospheric Sciences) noted that in the third paragraph, the fourth word of the first sentence should be "has" instead of "as."

A motion was made to accept the report as amended. All were favor and the motion passed.

5. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, June 13th 3:00-5:00pm 650 Kerr Admin. Bldg.

Graduate Council

May 9, 2002 Minutes

Present: Remcho (chair), Brauner, Caughey, Collins, Cull, Ebbeck, Fisk, Francis, Markle, McNair, Niess, Prucha, Rettig, Sanchez, Watrous

Absent: Mishra, Radosevich

1. Approval of Council Minutes

The Graduate Council approved the April 25, 2002 minutes as written.

2. Graduate Level Learning

Council revisited this issue from previous meetings. New discussion on the topic included the following.

According to Sally Francis (Dean, Graduate School), the accreditation team that visited in 2001 emphasized a standard in which 50% of courses on a graduate program of study must be genuine graduate-level learning. The team's recommendation called for all bi-level courses to be thoroughly analyzed, all slash-course syllabi to be evaluated, and appropriate steps be taken to comply with that standard. When the accrediting body sends another team in 2002-03, they will require a response regarding how OSU is addressing their recommendation. Demonstrating that 50% of courses on a program of study are genuine graduate-level learning will not be easy. Measuring outcomes is difficult, but Council members generally agree that outcomes are the best way to determine if a course is a graduate-level experience.

Francis felt that establishing a 50% standard was important in satisfying the accrediting body. The previously discussed guideline of allowing 18 credits of 400-level work on a program of study could also be part of the solution. Implementation of the policy to permit inclusion of upper division credits should be up to individual colleges or departments, which would give them flexibility to work through their own solutions.

Collins suggested giving units the choice of either eliminating or reviewing their slash courses, acknowledging that "one size does not fit all." Fisk suggested an interim policy where a maximum of 18 credits of 400- or 400/500 credits be allowed on a graduate program of study, and 18 credits be pure 500-level courses. Slash courses would still need to be evaluated under this policy. A further step would be to offer colleges the opportunity to evaluate their courses. The question remained: To whom will departments justify these courses? Who will be responsible for monitoring courses long-term? Another concern was that some programs don't have enough 500-level classes to comprise 18 credits of 500-level course work. In some graduate programs, 85% - 100% of graduate courses are slash courses. Yet another concern was for non-thesis master's programs in which even more coursework would have to be purely 500 (since the maximum number of research in lieu of thesis credits is less than the maximum number of allowable thesis credits on a 45 credit master's program.)

Alex Sanchez (Education) suggested that departments might look at multidisciplinary approaches and other more creative solutions to offering graduate programs without adequate resources. Units could combine with other disciplines to create viable programs.

Remcho summarized the options for addressing the issue: a model to measure outcomes, a policy to allow certain number of slash courses on graduate programs, or a requirement for justification of slash courses in order to keep them. He asked Council to weigh in on how they feel about possibilities. Allowing either elimination or justification of slash courses had strong support. Such a policy would be an amendment to the previously suggested guidelines. Francis noted that justification needed to include not simply differentiation between graduate and undergraduate coursework, but a requirement that the graduate-level portion be true

graduate-level learning. Otherwise, the 400- and 500- levels could be different without ensuring that the 500-level portion is a graduate experience.

Fisk suggested de-coupling the policy of allowing undergraduate coursework on a graduate program from any policy designed to ensure that graduate students were getting adequate graduate-level experiences in their 500-level courses. He believed that allowing 400-level coursework was important for interdisciplinary background work, for example.

It was noted that undergraduates might think that 400/500 level courses are more rigorous than 400-level courses, but OSU cannot require undergraduates to take 500-level credits to satisfy undergraduate degree requirements. It would be possible for a department to require graduate students to take 400-level courses to graduate because graduate programs have a less-structured curriculum than undergraduate programs.

3. Program review guidelines

Council members received copies of the original program review guidelines and of guidelines revised by Francis. Francis noted that her objectives in revising the guidelines were to focus on program improvement, to provide flexibility of scheduling reviews, to include more external reviewers, and to identify outcomes. Program reviews would culminate with an action plan to address recommendations of the review team.

Council members were invited to comment. Paul Cull (Engineering) noted that a one-day review is very constraining, and sometimes the self-study document prepared by the unit to be reviewed is not always well done or complete. He suggested requiring all faculty members to sign off on the cover page to ensure adequate faculty contribution.

Francis offered another revision of Appendix I. Changes to the appendix are the result of work by a task force on outcomes assessment. Sanchez noted that external reviewers would also help assess whether outcomes are relevant or not.

Changes to scheduling included possibly postponing a review for a department that is in good shape, with appropriate evidence that such postponement is justified. Maggie Niess (Graduate Admissions Committee) suggested that departments might need more than 2 years notice of an upcoming review to be able to collect outcome data. It should be recommended that departments begin to develop baseline data of outcomes.

The program review guidelines will be revisited at a later Graduate Council meeting.

4. Summer Council Activities

The method of handling of Category II requests over the summer will be need to be determined before the last Graduate Council meeting. The current Category II subcommittee will not be available during the summer.

5. Other Business/Announcements

Rettig discussed upcoming agenda items including Category I to create a School of Electrical Engineering and Computer Science, program review reports of Forest Resources, ECE, and Physics, follow-up review reports of Animal Science and Counseling.

Council may need to decide on electronic approval of the June 11 minutes.

Future meetings of the Graduate Council are scheduled for:

Thursday, May 23rd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, June 13th	3:00-5:00pm	650 Kerr Admin. Bldg.

Graduate Council

April 25, 2002 Minutes

Present: Remcho (Chair), Brauner, Caughey, Collins, Cull, Ebbeck, Fisk, Francis, Markle, McNair, Niess, Prucha, Radosevich, Rettig, Sanchez, Watrous

Absent: Mishra

Guests: Mike Quinn, Chair of Curriculum Council; Anthony Wilcox, Institutional Review Board

1. Approval of Council Minutes

The March 14 Graduate Council minutes were amended to reflect that Martin Fisk (COAS) was absent and Tony Collins (Pharmacy) was present. The Council approved the minutes as amended.

2. Institutional Review Board Requirement

Anthony Wilcox (Institutional Review Board) attended the Council meeting for this discussion. At its March 14, 2002 meeting, the Council indicated support for requiring that theses and dissertations involving human subjects research have IRB approval. The Council revisited the issue because it was asked to formally adopt its own policy. For the Graduate School to enforce a policy, the policy must be included in the rules and regulations section of the Graduate Catalog. Three alternate policy statements presented to the Council were:

1. The OSU Institutional Review Board must review and approve any research involving human subjects that will be used to satisfy master's thesis or doctoral dissertation requirements.
2. In order to satisfy master's thesis or doctoral dissertation requirements, all research that involves human subjects must be reviewed and approved by the OSU Institutional Review Board.
3. The results from studies conducted using human subjects without obtaining Institutional Review Board review and approval may not be used to satisfy master's thesis or doctoral dissertation requirements.

Questions and discussion points included:

- Does the policy include surveys? Yes. The information provided to the Graduate Council at their March 14 meeting clearly defines the types of activities covered by the policy.
- How is this policy going to be enforced? Bruce Rettig (Associate Dean, Graduate School) noted that the Graduate School will determine the best way to implement the policy, should it be adopted.
- Steve Radosevich (Forestry) voiced concern over the possible ambiguity of stating that the IRB reviews and approves research. The language should not confuse the IRB's role with the role of the student's graduate committee. The nature of the research questions is not part of the IRB review in the same way that a graduate committee is concerned with the nature of the research, but any ethics and risk inherent in the research are under the purview of the IRB. To clarify this issue, Sally Francis, (Dean, Graduate School) suggested the following:
 - Statement a: change "any research" to "any proposed research"
 - Statement b: change statement to past tense
 - Statement c: change "review and approval" to "approval"
- Will students have to go through IRB training? Anyone who seeks approval after April 1 will have to get training.

Statement "c" received support from David Brauner (Liberal Arts) and Vincent Remcho (chair, Science) because it is very clear and concise, and it includes consequences of failing to abide by the policy.

The Graduate Council moved to accept the policy as an amended form of the statement "c" (stated below), and the motion was seconded. The following policy was approved unanimously:

The results from studies conducted using human subjects without obtaining Institutional Review Board approval shall not be used to satisfy master's thesis or doctoral dissertation requirements.

Language will be placed in the Graduate Catalog under Masters Thesis and Doctoral Thesis headings. This policy does not cover non-thesis option since projects or papers generated in those degrees do not go through the Graduate School. In those cases, it would be up to the major professor and principle investigator to abide by IRB policy.

3. Human Performance and Movement Studies Follow-up Report

The written follow-up report was distributed to the Council before the meeting, and is appended at the end of these minutes. Paul Cull (Engineering) read the report.

A motion to accept the report as submitted was made and seconded. All approved and the report was accepted. Both documents will be sent to the Provost for informational purposes.

4. Graduate Level Learning Actions

In March, The Graduate Council put forth to the Curriculum Council the following policy changes for consideration:

Redefine the course numbering system as-

400

Primarily for senior level undergraduate students. Graduate students may enroll and use the credit on a graduate program of study subject to approval by the student's program committee.

500

Primarily for students in master's degree programs. Qualified junior or senior undergraduate students may enroll and use the credit to satisfy requirements for a bachelor's degree.

A maximum of 18 non-blanket 400-level credits are allowed on a graduate program of study.

The Curriculum Council considered the graduate level learning policy proposed by the Graduate Council at its meeting on April 18, 2002. Remcho attended the meeting. Francis asked if the Graduate Council saw the two components of its March action as coupled or as independent components. The Council indicated that they were coupled, and if one component failed at the Curriculum Council, both failed.

Prior to the Curriculum Council meeting at which this item was considered, Mike Quinn invited comment about the proposed policy from department chairs, deans, and faculty at large. Opinions received were taken forward to Curriculum Council. The following arguments received by Quinn against the policy were shared with the Graduate Council. Remcho also indicated how he responded to each when he met with the Curriculum Council:

- Budgets are not adequate to offer separate 400- and 500-level courses. With fewer offerings, students have difficulty finding electives.
 - Response: Allowing 18 credits of 400-level work on a graduate program allowed leeway, as did the option of offering different courses in alternate years.
- Too few graduate students to justify offering separate 500-level courses.
- Allowing 18 credit hours of 400-level courses does not equate to giving graduate student graduate-level education.
 - Response: Courses should be accurately numbered. Peer institutions allow 400-level credits on a graduate program. Allowing courses on programs of study is still up to graduate committees. (Fisk commented that it is important for interdisciplinary programs needing undergraduate level prerequisites in other majors.)
- Should not force undergraduates to take 500-level courses to get their degrees (in the case where a 4XY/5XY course becomes 5XY only).
 - (Cull responded that it could encourage undergraduates to take graduate level courses, which is beneficial to them.)
- If they are split, lectures would be the same for each course. The only difference would be in

assignments.

- Response: Outcomes should be the focus, not the assignments.
- Allowing departments to offer 400 and 500 level courses at the same time and place would end up being the same thing.

Mike Quinn distributed an updated version of the summary of these responses and indicated that the Curriculum Council voted against the proposal that had been approved by the Graduate Council. He presented the major points of the Curriculum Council:

- The "slash course" problem is due to a lack of resources.
- It appears to be a college-by-college problem. It seems most acute with respect to the MAIS degree.
- Slash courses can be workable.
- One size fits all solution does not seem appropriate.

On April 17, 2002, Sally Francis sent a memo to Mike Quinn and Vince Remcho regarding the proposal to eliminate slash courses. That memo suggested focusing on outcome-based assessment, and directly influenced the following resolution, which the Curriculum Council passed on April 18, 2002:

In order to help Oregon State University ensure that students in 5XY sections of 4XY/5XY "slash" courses are getting genuine graduate-level learning experience, all future Category II proposals to create or change slash courses must clearly articulate the graduate-level learning objectives/outcomes expected of students registered for the 5XY version of the course. This requirement is in addition to the criteria already listed in the Curriculum Handbook.

The Curriculum Council's resolution reflects its opinion that a review of all slash courses is not necessary at this time.

There was some debate about how big of a problem the slash courses actually present, and how important it was to do something about it.

- Mike Quinn noted that different administrators seem to have different perceptions about how the accreditation team viewed the problem, which was one of the seven recommendations of the accreditation report. Francis will be invited to a future meeting of the Curriculum Council to help members understand the scope of the problem. Rettig stated that Dr. Gerald Fetz, a member of the accreditation team, indicated he had heard complaints about slash courses across campus.
- Francis added that during graduate program reviews over the past 2 years, students have been very vocal about the problem campus-wide. The Graduate Level Learning Task Force had reported 17% level of dissatisfaction, but Francis noted that since satisfaction is not normally distributed (it is almost always skewed toward the positive), 17% indicates a big problem. Francis believes that dissatisfaction arises because of unmet expectations. When graduate students enter a 500-level class and perceive that they get an undergraduate-like experience, they are dissatisfied. Allowing them to use 400-level courses on their programs would at least adjust their expectations and perhaps alleviate some dissatisfaction. It would not, however, necessarily increase the amount of graduate-level experiences they have.
- Francis expressed concern over the accreditation team's visit next year, when they will follow-up on their recommendation to "fix" the slash course problem. They may not expect the problem to be completely fixed, but they do expect progress. During the visit last April, she had argued unsuccessfully with Dr. Fetz that the 500-level component of 4XX/5XX courses are, by definition, graduate courses. But since the accreditation team had heard negative comments around campus, that technical argument did not prevail.

Council discussed if there was a way to prove that students were learning at the appropriate level, i.e. that the slash courses are, in fact, working.

- What would a review of all slash courses look like? It would represent massive amounts of work. Would it satisfy the accreditation team? They'd most likely ask what was going to be done with the results of the review. Would a review be done every year? A one-time audit would most likely not be a long-term fix.
- Brauner believed that an audit of syllabi would not be sufficient, and graduate students would need to do course evaluations.

What are the sources of the problem?

- There was great agreement that the problem stems from a lack of resources. Quinn indicated that the Curriculum Council had proposed the elimination of programs, but that proposal was rejected. If more resources do not become available and nothing is eliminated, it is unclear how to fix the problem. Brauner agreed, saying that departments, especially in Liberal Arts, "live or die" by credit hours, and 500-level courses are in great danger of not meeting the minimum critical mass of enrollees.
- Many faculty are unaware of current Graduate Council policy regarding how 4XY and 5XY levels should be differentiated, and the policy is not taken seriously across campus.
- The slash course policy was instituted a long time ago, but no mechanism was instituted to help the faculty. Niess offered the WIC course approval procedures as a model. Brauner liked the idea of providing better guidelines, especially for faculty who are not tuned in to graduate-level thinking. He suggested optional training on how to put graduate level work into a course.

Remcho challenged the Council to give the issue further consideration and to generate ideas and suggestions of how to address this problem in a substantive way. He then invited Francis to share the points of the memo she sent to him and Quinn. Quinn asked if all existing graduate programs could meet these suggestions, or if any would any be in danger of folding. It was noted that MAIS-only programs may have some difficulty. Brauner spoke for his department, noting that Anthropology was not going to give up their graduate program and they'd adapt however they could to make sure they did not lose their program.

Radosevich pointed out that using an outcome-based approach and offering slash courses should not be mutually exclusive. Slash courses can have specific learning outcomes for 400- and 500- level. Maybe the outcome-based approach is the best solution. Francis agreed that outcomes are most important, and that slash courses could be workable in an outcomes-based model. But it would have to be done for all existing courses to be satisfactory to the accreditation team. Francis also noted that the Graduate Council should ultimately care about ensuring genuine graduate-level education regardless of the accreditation issue.

Vicki Ebbeck (Health and Human Performance) asked Quinn for a point of clarification: Is it possible to have two different levels of a course with the same title and same catalog description? Quinn said that it was discouraged, but may not be prohibited. Rettig said titles would most likely be slightly different and descriptions do vary.

5. Program review guidelines

Francis has begun work on principles that should be addressed in updating of the current guidelines. Council members received a bulleted list prior to the March 14 meeting. The current guidelines were last revised in 1990.

Francis noted that the guidelines should be revised to the following principles:

- Program reviews are about program improvement. The review process must close the loop and use the analysis to directly improve programs.
- Flexibility should be provided, if possible, to alter scheduling of reviews (e.g. use a longer time cycle for higher performing programs, or shorter for those with problems)
- The external community should be engaged more. More external reviewers, including prospective employers, should be involved.
- Assessment of outcomes should be the focus. It seems that current guidelines are focused on inputs (students, faculty, courses) and does not address outputs.
- Departments should develop action plans for addressing the recommendations of reviews to form the basis of the meeting with the Provost. The plan would be signed by the Provost as a record of that meeting. This document would replace the Provost letter.

Draft revised guidelines will be distributed to Council for discussion at the next Council meeting.

6. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, May 9th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 23rd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, June 13th	3:00-5:00pm	650 Kerr Admin. Bldg.

March 2002

March 2002

On March 4, 2002, Paul Cull and Cheryl Jordan from the Graduate Council met with Tony Wilcox, department chair, and Vicki Ebbeck, graduate coordinator, to follow-up on the recommendations of the Graduate Council's 2000 review of the Human Performance and Movement Studies graduate program.

As a basis for the discussion the departmental representation had prepared a report including the Graduate Council recommendation and department actions taken in response to the recommendations. A copy of this report is attached. Overall, the department has been able to implement almost all of the recommendations. We will now briefly summarize the recommendations, these actions that have been taken, and the few areas where more effort may be needed.

> Reduce teaching loads.

The department has reduced graduate faculty teaching loads to an average of 1.2 courses per term or 4 courses per academic year. While we recommend a reduction in course load to 1 per term for research active faculty who are supervising graduate students, the department seems to have too many undergraduate teaching responsibilities and too few resources to accomplish a further reduction.

> Incentives for scholarly productivity.

New post-tenure review and incentives should respond to this point.

> Decrease the number of PhD students and areas of concentration

From Winter 2000 to Winter 2002, the number of PhD students has decreased from 29 to 24. After comprehensive review by a department sub-committee the graduate program areas of concentration were reduced from seven to six, eliminating the Motor Learning and Control concentration.

> Reduction in the number of slash courses offerings

While some slash courses are still being used this will change when the new Graduate School rules eliminating slash course offerings and allowing up to 18 credits of 4xx level courses in a graduate program are in place. It is probable that, at least, two current slash courses will be changed by the department to 5xx only.

> Research collaboration with other units.

There is, currently, some collaboration with the Linus Pauling Institute and the Department of Nutrition and Food Management. The realignment in the new college provides potential for more cross department collaboration.

> Courses for PhD students.

No new courses were introduced but one meeting per week doctoral seminars (EXSS 607) that address specific topics are now operating.

> Reduction in required course work and earlier research involvement for PhD students.

The department has reduced the number of required credits in the doctoral minor from 24 to 18, however the department still needs to work on early involvement of doctoral students in the research process. While there are individual lab meetings and journal reading groups, students are not required to participate. One possibility would be to assign each incoming student to a research group. Another possibility would have each student rotate through the research groups spending one term as part of each lab.

> Strategic plan.

Some progress has been made in deciding to eliminate one area of concentration. With the reorganization into a new college, the department needs to look at and plan for the development of their programs in line with the goals and plans of the college.

> Seminars.

Two specific topic seminars are now operating.

Annual review of progress.

A process for annual review of doctoral students has been developed and implementation began Fall 2001.

>Feedback for internships and practical experiences.

There is, annually, at least one graduate student (MAT) at a remote site and a number of students work on campus for other departments. The department needs a mechanism for communicating with these students and evaluating their progress in these assignments.

>Upgrade computer access.

There has been some improvement in providing computer access in common areas within the department and in labs, but no improvement in the graduate student offices. At present, all graduate students need and should expect to have access to e-mail and the net.

>Mentoring in teaching.

Seminars addressing teaching have been held, however more work is needed in this area. Such techniques as faculty visits to class, video taping teaching, and providing feedback for GTAs need to be considered.

>Increase number of faculty at rank of professor.

One promotion occurred last year, and another is going forward this year.

Graduate Council

March 14, 2002 Minutes

Present: Caughey, Collins, Cull, Ebbeck, Fisk, Francis, Markle, McNair, Mishra, Prucha, Remcho, Rettig, Sanchez, Watrous

Absent: Brauner, Fisk, Niess, Radosevich

Guests: Anthony Wilcox, Chair, IRB committee.

1. Approval of Council Minutes

Barbara Watrous (Veterinary Medicine) wished to amend the February 14 minutes to indicate her presence. The minutes were approved as amended.

2. Institutional Review Board Requirement

The Research Council recently approved a revised policy from the OSU Institutional Review Board (IRB), which states that faculty whose research involves human subjects must have IRB approval for their research, or they may not publish the results. Anthony Wilcox, representing the IRB, met with the Graduate Council to discuss how the revised policy will similarly affect graduate student research involving human subjects. Wilcox distributed a copy of the policy to the Council, which is appended at the end of these minutes. The policy makes explicit the ramifications for student research involving human subjects if the researcher fails to seek IRB approval: any project that has not been reviewed and approved may not satisfy a Masters or PhD requirement. Included in the policy is a definition of research to which the policy applies. The criterion for student research lies in the extent of its dissemination. Theses, dissertations, and honors theses are all considered research, but class projects are not included. However, if a class project is to be published, it must be reviewed and approved by the IRB prior to data collection.

Questions from Council members included:

- What fraction of research involving human subjects does not currently pass before the IRB? Wilcox did not have an estimate of current noncompliance. He suspected that the new policy will create more work for the IRB, but that is their charge.
- How often are requests denied? IRB review very rarely results in denial, but often in revision.
- If a student is going out to landowners to request access for research, would that fall under the IRB? No - the landowners are not involved as subjects.
- Will this affect master's projects (as opposed to theses)? Only if the project were to be published or otherwise disseminated must it pass IRB approval.
- Is retroactive review available? No. If someone decides to publish research involving human subjects after gathering data, they would have to get IRB approval and start over. Many journals require IRB approval before publishing.
- How will the new policy be publicized? If approved, it will be distributed by the IRB, linked to the Graduate School web site, and presented to the Faculty Senate and Faculty Senate Executive Committee.
- How will the policy be enforced and what will the Graduate School role be? A thesis involving research on human subjects should include a statement that the research has been approved by the IRB. Non-compliance would result in the rejection of the thesis. Mary Prucha (Coordinator of Graduate Services, Graduate School) suggested sending an informational sheet at the time of program filing to alert students of the policy well ahead of time.

Vince Remcho (chair, Science), noting that he did not detect any lack of support from the Graduate Council for the policy, asked Bruce Rettig (Associate Dean, Graduate School) and Prucha to work with Wilcox through any communication issues.

3. Graduate Level Learning Actions

Remcho met with the Curriculum Council on February 21 regarding the Graduate Council endorsement of the report of the Task Force on Graduate Level Learning. The Curriculum Council requested answers to several questions before they are comfortable with accepting the report and approving related policy. Each question is listed below, followed by the response the Council decided upon, and then followed by a summary of the discussion leading to that response.

Question:

How long will a department have to eliminate its existing 4xx/5xx courses?

Response:

By December 2003 a department must eliminate slash courses so that they are not listed in the Fall 2004 General Catalog as such. In the meantime, the Graduate Council recommends that the Curriculum Council go ahead and de-couple the 400- and 500-level courses.

Discussion Points:

- Vicki Ebbeck (Health and Human Science) did not recall the Task Force addressing this issue.
- Paul Cull (Engineering) recalled that the Council hoped to avoid setting a deadline, making it possible to have slash courses but encouraging departments to align. But, if the Task Force report and related policies are approved, all policy referring to slash courses will be eliminated, so slash courses could no longer exist.
- Setting a deadline may create a large number of Category II curriculum proposals coming in at once. Ebbeck wondered if a procedure could be developed that may not require extensive paperwork. Alex Sanchez (Education) believed that the paperwork would be necessary to satisfy the accreditation team. Rettig noted that the recently adopted electronic system for circulating Category II course changes does make this process easier and quicker than the circulation of hard copy materials. It would be helpful if the Curriculum Council could automatically de-couple current slash courses to avoid extensive paperwork. If there is a general agreement that these curriculum changes do not need much analysis, the procedure could move quickly. Each department might even simply prepare a list of all courses they want to change under the blanket rationale of the Task Force findings.
- The current slash courses may simply become 400- and 500- level courses offered at the same time and place. In practice things may look very similar. In this case, would approval of the Task Force Report and changes in policy solve the graduate level learning problem, or has the only change been one of semantics? What will the opinion of the university accreditation team be about this?
- Chandra Mishra (Business) suggested a 2-year deadline (Fall 2004) for departments to eliminate slash courses. The procedure would be for departments to elect to offer either the 400- or the 500-level course. To meet this deadline for catalog visibility, departments would have to make their decisions by December 2003.
- Departments may want to retain both 400- and 500-level courses so that they can be flexible in their scheduling (offering a course as undergraduate one term/year and graduate another term/year). A procedure needs to be in place to make the 400- and 500-levels of the course stand-alone courses. They are currently designated in the General Catalog as slash courses.
- The Curriculum Council could split them into separate courses now and keep them split for the next 2 years. By Fall 2004, they should no longer be offered at the same time.
- Should new Category II proposals for 4XX/5XX courses be accepted? Yes, but if the report and related policies are approved, Rettig could contact submitters to alert them to the pending change.

Question:

How will transfer courses be treated?

Response:

Transfer of credits must be senior- or graduate-level and approved by the student's graduate committee. Whether to include the language designating the level of coursework that could be transferred was not resolved. It may be unnecessary since policy regarding what courses are allowed on a graduate program of study would override any attempt to transfer lower level courses.

Discussion Points:

- Reserved credits from a baccalaureate degree, non-degree credits, post-baccalaureate credits, and courses taken at other universities are considered transfer courses.
- The Curriculum Council wanted to know if it would be possible for a student to transfer up to 18 credits of undergraduate level credits from another university. Ebbeck suggested that would be acceptable if the courses were taken as part of a graduate program. However, whether or not the courses were on a graduate program is not transcript-visible, so enforcing that requirement would require substantial time and effort by Graduate School staff as they communicate with the institutions that granted prior graduate degrees.
- Currently, graduate students can transfer any course in which they received a B or better from another institution, but if the course is not numbered as a graduate level course, the Registrar from that institution must verify that is was, in fact, graduate level.
- One idea was to focus on having the student meet residency requirements, and making sure the courses are appropriate to the student's program of study.
- Whether an undergraduate can reserve 400-level credit to apply toward a graduate program at OSU should be up to the student's advisory committee. Currently, policy says that reserved credit must be graduate level, so this would require modification of existing policy.
- Could residency be satisfied with 400-level coursework? Yes, if it was part of the graduate program. Residency starts when they are admitted to the graduate degree program.

Question:

Can a department schedule class 4XY and 5XY at the same time and place?

Response:

As this body does not make scheduling policy, there is no Graduate Council policy, implicit or explicit, that addresses this.

Question:

What are the implications of this change with respect to the RAM funding model?

Response:

No implications, according to Bob Burton, indicated by Rettig.

Rettig supplied a list of additional questions with reference to the Graduate Catalog, should the Curriculum Council accept the Task Force Report and related policy. Many of these were dealt with at the present and previous Graduate Council meetings. For instance, how 400-level courses could be distributed across a student's major/minor would be up to the student's committee. One related issue involves a hypothetical case where all minor work is at the 400-level: is this an undergraduate minor or graduate minor? A minor that is completely transferred in is still considered an OSU minor, so a minor that involves only 400-level courses is a graduate minor if approved by the student's committee, including his/her minor professor. Regarding the timing of filing a program of study, under the proposed policy a Master's student would file a program after they have taken 18 credits of 400- and 500-level courses as a degree-seeking student.

4. Second Master's Degree

Rettig distributed, via email, the following draft core proposal for discussion: A candidate for a second master's degree from Oregon State University may request the application of up to 15 credits, appropriate to both programs, from the first master's degree program to another. In the email, Rettig also identified three other issues, including residency, a capstone requirement, and a GPA requirement. At the heart of the proposal is that there are two degrees and a student must meet all requirements of each degree. A student would have two committees and would be admitted separately into two degree programs. A motion was made to adopt the following policy:

A candidate for a second master's degree from Oregon State University may request the application of up to 15 credits, appropriate to both programs, from the first master's degree program to another, subject to the following three requirements:

- *First, credits used to satisfy the residency requirements of one master's degree may not be used to satisfy the residency requirements of another master's degree.*
- *Second, students who earn two master's degrees at Oregon State University must complete all degree requirements for each degree. This requires filing separate programs of study forms for each degree, filing separate commencement applications for each degree, completing separate projects or theses for each degree, filing separate Request for Final Oral Examination forms for each degree, and passing final oral examinations for each degree.*

- *Third, such credit will be granted only for graded course work earned at Oregon State University and completed with a grade of "B" or higher.*

The motion was seconded and all approved. The policy was adopted.

5. Dissertation Printers

Departments were polled about not allowing library drafts of theses and dissertations to be produced on inkjet printers, dot matrix printers, or printers that printed at a resolution lower than 300 dpi. Many departments agree with that recommendation. The concern is that such printings have a shelf life of 20 years or less before the printing deteriorates. Laser printers and photocopiers do not pose such a problem. The point was made that if everything went electronic in the future, reliance on hard copies would be reduced, but there are no current plans to require digital versions of Masters♦ theses. Cull indicated that he would like to research the problem before making a recommendation. One issue is the financial impact on students. Currently, the only requirement is that students use cotton bond paper for their final copies; the library would prefer acid-free paper because it does not brown over time.

6. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, March 28th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 11th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 25th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 9th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 23rd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, June 13th	3:00-5:00pm	650 Kerr Admin. Bldg.

Graduate Council

February 14, 2002 Minutes

Present: Remcho (chair), Brauner, Caughey, Collins, Ebbeck, Fisk, Francis, Markle, McNair, Mishra, Prucha, Rettig, Watrous

Absent: Niess, Sanchez

1. Approval of Council Minutes

The January 24 Graduate Council Minutes were approved as written.

2. Bioengineering Follow-up Report

Vince Remcho (Science) presented the report from the Bioengineering follow-up review that took place on January 18, 2002. Remcho and Mark Christensen, a participant in the 1998 full review, conducted the follow-up review. Remcho and Christensen found that all four recommendations made in 1998 review had been addressed in the program.

- Graduate students are now serving on appropriate departmental committees as recommended.
- The department has implemented a series of three required seminar courses.
- The department has implemented a tracking system to monitor the progress of students through the graduate program.
- The department is in the process of refining two vision statements, one for each of the research focus areas (water resource engineering and bioprocess engineering). The different foundations of these focus areas support the decision of the faculty to develop independent but related vision statements.

Remcho commented that the recent change in name of the department from Bioresources Engineering to Bioengineering reflects the changing environment of the discipline. The department has recruited faculty and graduate students that also reflect its changing focus. The program is ranked within the top 25 in the country according to the Gourman report.

During discussion of the report, Sally Francis (Dean, Graduate School) shared long-term enrollment data which reflected that enrollment is declining in the department, and thus recommended striking the statement in the report that a recent decrease is within normal enrollment fluctuation. Mary Prucha (Coordinator of Graduate Services) suggested adding language to specify that the review focused on the Bioresources Engineering graduate program within the Department of Bioengineering.

As an aside, Francis commented that, in 1998, the Bioresources Engineering department chair had brought an action plan to the program review meeting with the Provost. This action plan was easily included in the letter from the Provost to the department concerning the review. Francis suggested asking all unit chairs to bring an action plan to provost meetings as a type of informal contract for how the department will address the recommendations of the review. She suggested including instructions to bring such an action plan in the revised Program Review Guidelines that are being developed.

A motion was made and seconded to accept the follow-up report as amended. None opposed and the motion passed. The approved report is appended at the end of these minutes.

3. Graduate Level Learning Actions

At its January 24 meeting, the Council tentatively agreed to adopt the principal recommendation of the Graduate Level Learning Report, although a final decision was not made on the number of 400-level credits to

be allowed on a graduate program of study. Since that meeting, the Task Force report has been posted on the Graduate School website to provide campus-wide visibility to the findings of the Task Force and its subsequent recommendations. Among others, the Faculty Senate President, the Executive Committee, and the Curriculum Council chair reviewed it. They all wanted clarification about whether 400-level credits would be allowed only on Master's programs or on Doctoral programs as well.

Remcho noted that, if the Graduate Council were able to finalize the policy at this meeting, it would be taken to the Curriculum Council on Feb 21. If approved there, the policy would be circulated to the Executive Committee in advance of the March Faculty Senate meeting where it would be put forward. Thus, it could go into effect by the beginning of the 2002-03 academic year.

The Council first discussed allowing 400-level credits on a Ph.D. program. One question was whether 400-level credits would be allowed on doctoral programs. Chandra Mishra (Business) observed that, because a Ph.D. is typically 108 hours, nine to eighteen hours of 400-level credits would only be a maximum of about 10% of the PhD credits, which would not be inappropriate. Vicki Ebbeck (Health and Human Sciences) thought that a student's advisory committee and program requirements should decide which courses are appropriate for a given program, and that such a restriction should not be included in the policy. There was general agreement on that point.

After some discussion, the Council generally agreed that permitting up to 18-credits of 400-level coursework on graduate programs of study provided programs added flexibility. With the maximum number of 400-level credits being established by the Graduate Council, programs may make their own determination regarding the appropriate number of 400-level credits utilized by their students within this maximum. The Council voted unanimously to modify the Task Force Recommendation by increasing the number of 400-level non-blanket credits to 18, and to adopt graduate policy to permit "a maximum of 18 non-blanket 400-level credits to be used on a graduate program of study."

Some questions about logistics and implementation followed:

- Should the allowable 400-level credits be restricted to inside/outside the major?
- How would the policy affect residency credits?
- How would the policy affect the timing of filing a graduate program?
- How is the possible transfer of 400-level courses from another institution onto an OSU graduate program currently handled? Bruce Rettig (Associate Dean, Graduate School) explained that, currently, instructors of the course must explain in what way this was graduate level work.
- Some concern that students may try to use course work from their undergraduate degree on graduate programs of study was expressed, but current policy regarding reservation of credit would prevent such an occurrence.

Francis suggested circulating drafts of the new Graduate Council policy by email to meet the preferred timeframe for carrying forward the Graduate Level Learning Task Force recommendation. She thought that some issues about implementation could be included in the policy, but Remcho was concerned that the policy would become too cumbersome if too much detail was included.

The revised Graduate Level Learning Task Force recommendation to redefine the course numbering system for 400 and 500 level courses will be forwarded to the Curriculum Council for its deliberation. Also, the following motion was made and seconded: "A maximum of 18 non-blanket 400 level credits are allowed on a graduate program of study." The motion passed. The Curriculum Council will be informed of the Graduate Council's proposed policy regarding the use of 400-level course work on graduate programs.

4. Required Minors on Masters

Not all units on campus support the requirement that all MS and MA degrees include minors. At a Graduate Education Round Table meeting Dean Mark Abbott (Oceanic and Atmospheric Sciences) suggested revisiting the policy. Should this policy be discontinued, making the identification of minors optional for MS and MA programs, as it is for doctoral programs?

Rettig opened discussion by mentioning that he could not find a minor requirement on any peer institution's website. The intent of the policy is to ensure proper breadth on a graduate program, but in some departments, students find a way to minor and major in the same department. Many Council members thought that breadth is best left to individual program design through advisory committees, and it should not be forced through policy. Maximum flexibility should be the goal.

A motion was made and seconded to drop the minor requirement on MS and MA programs. The motion passed unanimously.

5. Second Master's Degree

Oregon State University does not allow courses used for one master's degree to be used to fulfill degree requirements for a second master's degree. Some universities (e.g., University of California at Davis) allow a few credits to count toward more than one degree, either by approval or by design of two complementary master's degree programs. Others (e.g., University of Oregon) require fewer credits on a second master's from their university than on the first. Chandra Mishra (Business) requested exploration of the rationale for these different approaches and consideration of a recommendation to modify current OSU policy.

Mishra noted that many students in disciplines such as engineering and forestry take some business courses and then want an MS and an MBA. If they could just take 30 additional business credits to get the MBA this would allow this to happen. According to a handout of peer institution policies provided by Rettig, a system that would allow this is in place at other universities. Mishra thinks changing OSU's policy would be a good way to respond to market demands.

Rettig suggested allowing an overlap of 15 credits if the Graduate Council wanted to take action, because that level is consistent with the University of Oregon, and because the remaining 30 credits covers core requirements of most programs. Mishra agreed that allowing students to earn two degrees with 75 credits would be ideal. Delores McNair (student) saw tremendous advantage for students, who could be encouraged to pursue a second degree through the new policy, whereas right now it might seem too formidable.

Rettig suggested Council members review the peer institution information and discuss with colleagues before taking action. David Brauner (Liberal Arts) appreciated the opportunity to reflect further, and mentioned that it might not work well in every program. Mishra agreed that implementation of a new policy should be within the design of a program or at the discretion of student's committee, and thinks it could spur on more innovative programs by combining, for example, Business and Engineering. It could also reduce interest in dual majors and one degree. Rettig emphasized that students must fully earn both degrees. Paul Cull (Engineering) wondered about requiring two theses. Perhaps one would be sufficient if both committees agree?

Mishra and Rettig will work to draft a paragraph for discussion.

6. Other Business/Announcements

Francis updated the Council on the continuous enrollment policy. The last version of the policy was forwarded to Provost Tim White for his approval on February 13, along with implementation suggestions. The recommendation is to begin implementation with fall term 2002 for new students and for currently inactive students who have to reapply upon their return. Current students who remain active will be permitted to complete their degree programs under the prior registration policy. This old policy will sunset in two years, at which time all degree-seeking graduate students will be subject to the new policy. A transition team has been appointed to work on implementation. Francis expects White to approve the policy and announce it to the campus soon.

McNair stated that students are opposed to this policy. She had assumed that the Graduate Council's role involved more than discussion and was unclear how the Deans' Council had finalized the policy. She was also unclear about student involvement and feedback and where that was integrated into policy and thought the process was not a shared development of policy. Remcho felt that some confusion may have resulted from an initial perception that such policy was academic, rather than administrative in nature, and as such was under the purview of the Graduate Council. Francis indicated that the Council could go on record with an opinion even if it is not under their purview, and that the final draft of the policy was modified considerably as a result of input provided by both the Graduate Council and the Graduate Student Senate.

Future meetings of the Graduate Council are scheduled for:

Thursday, February 28th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, March 14th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, March 28th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 11th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 25th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 9th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 23rd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, June 13th	3:00-5:00pm	650 Kerr Admin. Bldg.

Appendix: Follow-up Review of the Bioengineering Graduate Program College of Agricultural Sciences & College of Engineering

Introduction:

On Friday 18 January 2002, a follow-up to the 1998 Graduate Council Review of the Bioengineering (formerly Bioresources Engineering) Graduate Program in the colleges of Agricultural Sciences and Engineering was conducted. Graduate Council representatives were Vincent T. Remcho (Chair; Chemistry) and Mark Christensen (Pharmacy). Mark Christensen served as chair for the full review in 1998. Representing Bioengineering were Jim Moore (Head) and John Selker (Graduate Program Coordinator). The follow-up review considered aspects of and factors affecting graduate education in the unit, primarily focusing on attributes of the program directly commented on in the 1998 review.

Administration:

As this review is being prepared, the department is adjusting to a name change and related programmatic adjustments. The Bioengineering designation more clearly represents the growing focus in the unit toward bioprocess engineering, though a strong contingent of water resource engineering researchers remains. With the retirement of the current chair, the appointment of a new department head for Bioengineering is anticipated in the near future. Two new faculty hires are also anticipated. A growing undergraduate program in bioengineering has consumed faculty time and energy with no additional hires to offset this demand. Nonetheless, the graduate program in the department is essentially the same in scale as was the case in 1998. An increasing trend toward graduate recruitment in the bioprocess engineering focus area and a decreasing trend in the water resources focus area was noted.

Faculty:

The composition of the faculty remains unchanged since the formal Graduate Council review in 1998. One retirement and one departure will necessitate two hires, with a third hire being a distinct possibility. Indications are that these positions will likely go to young engineers whose research emphasis falls into the bioprocess focus area. There are a total of 11 faculty in the unit at this time including 5 Professors, 4 Associate Professors, and 2 Assistant Professors. These faculty include one female (Associate Professor) and one minority (Assistant Professor).

Students:

The Bioengineering Department offers graduate programs leading to the MS and the Ph.D., with a fairly even distribution of students between the two degree programs. Graduate enrollment has decreased slightly (35 students in 1998, 27 since fall term of 2000), though this is within the limits of fluctuation in graduate enrollment that are typical. Increased hiring of postdoctoral associates is a reflection of increased research funding in the unit. All indications are that the students and faculty interact comfortably. The graduate stipend in Bioengineering is at a competitive level relative to peer programs. The issue of inadequate space has been cited as adversely affecting the ability of the unit to attract larger numbers of applicants and gain commitments from them. While there were no formal teaching assistant (TA) positions at the time of the 1998 review, an average of two TA positions per term are now available. The vast majority of students are paid on research assistantships (RA), with TA slots going to those students with an expressed interest in gaining teaching experience. The TA slots also ensure that new graduate students who have not yet committed to a research group will have a source of financial support.

Curriculum:

The 1998 review indicated that the graduate curriculum was loosely structured, with only two core courses. While the faculty have considered a more structured program with a larger number of "core" courses, the consensus was to maintain the flexibility offered by the two broad research focus areas (bioprocess engineering and water resource engineering) with their separate contingents of appropriate courses. The highly interdisciplinary nature of research in this unit supports the assertion of the faculty that a core curriculum is inappropriate.

Facilities:

Most of Bioengineering is housed in Gilmore Hall, with additional space in Gilmore Annex. Both buildings are showing their age, though they are well maintained. Excellent shop support has ensured that the department's facilities are put to optimal use. Computing facilities have improved since the 1998 review with the addition of some new computers. Grant support is expected to provide for additional computing resources

in the coming months.

Action on Recommendations from the 1998 Review:

Four recommendations were made by the review committee in 1998, and the department has acted on all four as described below.

1. Graduate students are now serving on appropriate departmental committees as recommended. The Department Head and Graduate Program Coordinator both indicated that this has proven valuable from the perspective of both the graduate students and the faculty. Improved communication between faculty and students was noted as one desired outcome of this change.
2. The 1998 review suggested the development of a formal seminar series to provide students with an opportunity to share their research and develop public speaking skills. The department acted on this by implementing a series of three required seminar courses. The first of these provides the student with an introduction to the department and research overviews from the faculty. The second seminar focuses on presentation of research findings and development of public speaking abilities. This seminar is taught by a faculty member whose past experience uniquely suits him for this role. The final seminar provides the student with an opportunity to develop and present a research proposal. It is clear that the Department took the recommendation of the review panel to heart and developed a program that truly benefits students.
3. As recommended in the full review, the Department has implemented a tracking system to monitor the progress of students through the graduate program. The system ensures that students are kept informed of the extent of their progress toward a graduate degree and the level to which they are performing.
4. The department is in the process of refining two vision statements, one for each of the research focus areas (water resource engineering and bioprocess engineering). The different foundations of these focus areas support the decision of the faculty to develop independent but related vision statements.

Summary:

This follow-up review revealed that the department has responded to the recommendations brought forth following the 1998 graduate program review after careful consideration of each. Appropriate changes in emphasis on the research focus areas, as reflected in the change in the name of the department and in graduate recruiting, indicate that the faculty are in touch with trends in research and the public interest and are working to stay at the forefront. It was noted in the full review that this unit was ranked in the top 25 in the nation; it is apparent that the faculty, students, and staff of Bioengineering are working to ensure that their unit remains in this elite position.

Graduate Council

January 24, 2012 Minutes

Present: Remcho (Chair), Caughey, Collins, Cull, Ebbeck, Francis, Mishra, Niess, Prucha, Rettig, Watrous, Radosevich

Absent: Brauner, Fisk, Markle, McNair, Sanchez

Guests: Bill Boggess, Head, Agricultural and Resource Economics; Erik Fritzell, Associate Dean, College of Agriculture; Nan Scott, Chair, Undergraduate AREc Program Review

1. Approval of Council Minutes

Vince Remcho (Chair, College of Science) asked the Council for any changes to be made to the November 29, 2001 or December 6, 2001 Graduate Council minutes. The Council approved the November 29 minutes with the change that Tony Collins (College of Pharmacy) be listed as present. The Council approved the December 6 minutes as written.

2. Agricultural and Resource Economics (AREc) Graduate Program Review Report

Steve Radosevich (College of Forestry) presented the report of the combined graduate/undergraduate AREc review to the Council. Bill Boggess, the AREc head, and Erik Fritzell, the Associate Dean of the College of Agricultural Sciences (CAS), were present to hear the report. The review, which was held in conjunction with a CSREES review, took place October 22-25, 2001.

AREc continues to operate in its strong tradition and reputation for graduate and undergraduate education. It is one of the stronger departments in CAS as well as at OSU.

Since 1991, the number of faculty in AREc has dropped from 31 to 25. Additionally, a quarter of the current faculty is not based on the Corvallis campus, but are found in the OSU Agriculture Program located at Eastern Oregon University and at branches of the Agricultural Experiment Station in Newport, Portland, Hood River, Union Station, and Aurora. Thus, maintaining the critical mass of faculty required on the Corvallis campus to run a successful graduate program may become more difficult. Despite this challenge, the masters and undergraduate programs are strong. The faculty group has undergone a lot of turnover, resulting in a healthy mix of professors through the ranks.

The University Graduate Faculty in Economics (UGFE) was formed 12 years ago. It coordinates course offerings in economics across campus, including the AREc, Economics, and Forest Resources departments. The UGFE is crucial for the discipline of economics to maintain a viable Ph.D. program because it allows OSU to have more faculty members in economics than any one department can afford to maintain. The UGFE must be maintained and strengthened.

The review team recommended dropping one area of emphasis that has difficulty maintaining students: economics of development. The other two areas (resource and environmental economics and food market and trade) are strong, and AREc and Economics are working together to develop at least one additional area of emphasis as a joint program. The review team also recommends looking at the suggestion to offer a fifth year certificate program very critically, as faculty resources may not be adequate.

The review team recommended better guidelines for the minimum number of students in courses, and suggested that the departmental goal of a 50/50 domestic/foreign student ratio may need review so that more foreign students are accepted. The final recommendation of the review team is for the AREc administration to work with other departments and OSU administration to better define a mechanism for

attaining stable instructional support.

Nan Scott, the chair of the undergraduate portion of the review, briefly indicated that the undergraduate program was strong. AREc is attracting new students from the metro area with its new Environmental Law focus. Its major dilemma is trying to maintain parallel programs in Corvallis and La Grande.

Radosevich recommended accepting the report. Boggess commented that he believed the report to be "good and fair." He indicated that it is a complex department, particularly in terms of faculty FTE. He agreed with the final recommendation of the team, and indicated that the strategy they should take to maintain a quality level of instruction is unclear. Fritzell reiterated the challenges of coordinating a program with students in La Grande.

The guests departed, hearing no additional questions from the Council. A motion was made and seconded to accept the report as submitted. None opposed, and the motion passed.

3. Graduate Level Learning Actions

Nancy Rosenberger, Faculty Senate President, has asked the Graduate Council to forward a recommendation about slash courses to the Faculty Senate. In its last discussion, the Graduate Council left with the general idea that the slash course program can work if faculty are better informed about what they need to do to differentiate 400- from 500-level courses. Ideas included:

- Being more rigorous in asking if a slash course was really appropriate in all cases and providing stronger rationale for slash courses.
- Requiring written justification in terms of enrollment of graduates and undergraduates enrolled and in terms of how the 400 (undergraduate) and 500 (graduate) levels are different in order to retain a slash course. Some departments need to offer slash courses because they could not offer a graduate program without them. If no justification can be given, require the unit to decide between offering the course at the 400- or 500-level.
- Examining each course and syllabus to determine if and how levels are differentiated.
- Allowing a certain number of 400-level courses on a graduate program and eliminate slash courses. The Graduate Council would set the upper limit of 400-level credits permitted on a program of study, and the graduate committees would indicate which 400-level classes should be allowed on a program.

Sally Francis (Dean, Graduate School) reminded the Graduate Council of the history of the slash course issue and why it was being addressed. She created the task force after hearing strong complaints from graduate students during graduate program reviews. The task force survey did not reflect what she had heard, but Graduate School exit survey respondents have indicated that degree recipients were not satisfied with the quality of OSU's graduate instruction. The accreditation team last year recommended that OSU fix the slash course problem, and OSU must respond to that recommendation.

Concerns about eliminating slash courses included the real possibility that having too few 500-level courses could eliminate some graduate programs, or that undergraduates could be required to take graduate-level courses to get a bachelor's degree. It could also reduce the number of electives across campus for undergraduates.

Some concern was expressed that asking departments for written justification would be too work-intensive, and that it was not clear who would evaluate statements that were submitted.

Concern about allowing 400-level courses on a graduate program included limiting a student's ability to get a bachelor's and a master's degree from OSU in the same discipline because they have exhausted available coursework. Francis suggested that departments would take that into consideration when deciding whether a course should be 400- or 500-level.

The decision was made to inform the Faculty Senate President that the Graduate Council is seriously considering policy to allow a to-be-determined number of 400-level undergraduate courses on a graduate program of study, and eliminating slash courses. The task force report and the proposed policy will be posted on the Graduate School website. It will be noted that current discussion proposes between 9 and 18 credits of 400-level course work be allowed. Input from faculty will be welcome.

4. Continuous Enrollment

Steve Radosevich chairs a subcommittee that includes Vince Remcho, Martin Fisk, Andy Young, and Delores McNair. Deans Sally Francis, Ron Adams, Thayne Dutson, and Kay Schaffer are working with the

subcommittee representing the Dean's Council. The purpose of the subcommittee is to work through a new policy of requiring continuous enrollment of graduate students. The purpose of the policy is to encourage degree completion, minimize time to completion, require payment when resources used, provide intent when students break registration, and provide accurate count of students. The minimum registration required will be 3 credits, excluding summer quarters.

Under the current draft of the proposed policy, two types of Leaves of Absence will be allowed: regular (for sickness, family matters, financial situations, etc.) and planned (proposed by program and approved by the Graduate School). Breaking registration without a leave of absence will require paying tuition for time that student was not registered.

Radosevich updated the Council on the current status of discussion. Dean Francis reported that the Graduate Senate brought up two questions: Why couldn't a student apply for leave if she wasn't in good standing? Why should a doctoral student have to re-take prelims if s/he had a break in registration? Other issues include how leaves of absences and breaks in enrollment may affect residency status and adding a grace period of 2 weeks into the subsequent term after a final examination for a student to submit his or her library thesis copies.

Radosevich reported that many people want this policy to be implemented, and there is much interest/concern surrounding it. It could be a positive development if the policy is carefully and properly implemented to protect graduate student interests while ensuring that University goals are met. Informing graduate students in a timely manner will be critical.

5. Reminders: Follow-up Reports, Scholarships, and Graduate Re-design

Mary Prucha (Coordinator of Graduate Services) reminded Council members of assignments for the coming year, including follow-up reviews. Copies of review reports for follow-up reviews are available. Follow-up review teams are responsible for reading the original report and the Provost letter (if available), scheduling a 1-1.5 hour meeting with the department head and graduate advisor for the program, and preparing a 1-2 page summary of findings with respect to recommendations made. Prucha informed the scholarship committees that the evaluation and selection process will start soon scholarships and fellowships administered centrally by the Graduate School.

6. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, February 14th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, February 28th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, March 14th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, March 28th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 11th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 25th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 9th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 23rd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, June 13th	3:00-5:00pm	650 Kerr Admin. Bldg.

Graduate Council

December 6, 2001 Minutes

Present: Brauner, Caughey, Collins, McNair, Mishra, Prucha, Radosevich, Remcho, Rettig, Sanchez, Watrous

Absent: Cull, Ebbeck, Fisk, Francis, Markle, Niess

Guests: Leon Liegel, Forest Science; Peter List, Philosophy; Robert Frank, CLA

1. Category 1: Proposal for Creation of MA in Applied Ethics

Peter List, chair of the Department of Philosophy, presented a Category I proposal to create a Master of Arts degree in applied ethics. Council members, noting that liaison letters demonstrated substantial interest by faculty and outside OSU in providing educational programs for people with scientific background, asked whether an option for the MS degree had been considered. List replied that the department had not considered any other option and that expanding the scope of the proposal did not seem wise given the resource constraints facing the university at this time.

In response to questions about the interdisciplinary nature of the degree, List noted that ethics faculty in Philosophy have been recognized for their work on several issues of importance to OSU such as those raised by the handling of animals used in both research and education and, more recently, controversies about genetically modified organisms. Students in the current MAIS program have tended to study issues such as these, and the faculty expects students in the applied ethics program to continue to do so. With the flexibility provided by a minor, which can be either in another unit or can be integrated across several disciplines, students are likely to select classes that would provide greater depth in the particular issues the student wished to pursue. Council members observed that, since any major is an acceptable minor, there could be requests by many graduate programs for a minor in applied ethics.

In response to questions about the availability of resources, List observed that the courses are already available and that much of the program has been delivered using the Master of Arts in Interdisciplinary Studies. Associate Dean Frank (College of Liberal Arts) reaffirmed the commitment of Dean Schaffer to contribute \$4,700 for library costs for the first three years of the program. CLA is very supportive of this degree and the College commends the Philosophy Dept. for an outstanding job of analyzing the potential of this degree program.

Questioned about what appeared to be a ceiling on the number of students, List indicated that they had set a goal of 12 students in the first 5 years. Council members suggested that, if anything, the department may be underestimating the interest in this program.

In response to a question about the required internship, during which the students will "observe and participate," List says it will be changed to "participate" since that is always preferable. The word "observe" was intended to reflect the role of the student as an impartial analyst, and may have been misunderstood. The thesis will, in most if not all cases, be tied to the internship.

Questioned about money for assistantships, List said that Philosophy now employs 3 graduate teaching assistants and one graduate research assistant; all funding comes from private fund sources. Instead of the current practice of making term-by-term commitments, assistantships will be offered on academic year appointments. The department also expects to have greater success in raising outside funding to support student work on an MA in applied ethics than it has had for students in MAIS degree programs.

A motion was made and seconded to enthusiastically approve the creation of Master of Arts in Applied Ethics.

The motion passed unanimously.

2. Graduate Level Learning Report

The Council briefly discussed the graduate level learning report and its recommendations. Rettig (Graduate School) indicated that allowing 400-level courses to substitute for some of the courses taken at 500 and 600 level may have a fiscal impact. After discussion of this issue, the Council decided to focus solely on whether allowing 400 level courses on a program of study would enhance or harm the quality of graduate education at Oregon State University. When a recommendation is reached on these terms, the Council will seek input on fiscal ramifications prior to forwarding a final recommendation to the Faculty Senate.

Rettig also identified several issues that would need to be addressed, if the Council decided to allow some 400 level courses on student programs. These included whether 400 level courses should be (1) allowed on both majors and minors, (2) allowed to meet residency requirements, (3) monitored to determine when a program of study must be completed, (4) permitted to count toward the requirement of a minimum 36 credits of graduate courses on a PhD program of study, (5) transferable from undergraduate, post-baccalaureate, or non-degree-seeking enrollment status, and (6) transferable from other universities. The Council elected to carry this agenda item forward to its next meeting.

3. Continuous Enrollment

Following the last meeting of the Council on November 29, 2001, Vince Remcho (Chair, Science) acted to appoint an ad hoc committee to study continuous enrollment and report back to the Council. The committee consists of Delores McNair (Student member), Steve Radosevich (Forestry), Martin Fisk (Oceanic and Atmospheric Sciences), Sally Francis (Graduate School) as an ex-officio member, and Vince Remcho as an ex-officio member. Remcho will call the first meeting at which the committee will elect its own chair from the voting membership.

Graduate Council

November 29, 2001 Minutes

Present: Collins, Cull, Ebbeck, Fisk, Francis, Markle, McNair, Niess, Prucha, Remcho, Rettig, Sanchez, Watrous

Absent: Brauner, Mishra, Radosevich

Guests: Stevan Arnold, Chair - Zoology Department; Sherm Bloomer, Dean - College of Science; Jeff McCubbin, Interim Dean - College of Health and Human Performance; Clara Pratt, Interim Dean - College of Home Economics and Education.

1. Approval of Council Minutes

A motion was made and seconded to approve the minutes from the meeting on October 25, 2001. All voted in favor; the minutes were approved.

Vicki Ebbeck (Health and Human Performance) reported that she had Steve Radosevich's (Forestry) proxy vote for this meeting. Vince Remcho (Chair, Science) had Chandra Mishra's (Business) proxy vote.

2. Report of the Zoology Graduate Program Review

Vicki Ebbeck noted that the self-study prepared by the Zoology Department is a model for future program reviews. Of special interest is the way that the department distributed the responsibility to review and report on each aspect of the department among members of the department. Following this observation, she paraphrased the introduction to the report, which reads as follows:

"Consistent with the articulated goals of the leadership of Oregon State University, the Department of Zoology has already achieved the aspiration to be perceived as a top-tier university. It is the nationally highest-ranking program offered by the university and includes some of the most high profile research conducted on campus. These attributes are, of course, the result of the building, over time, of an exceptional group of faculty who attract the attention of funding agencies, the media, and the public-at-large. At present, it is the sense of the faculty that they have been steadily losing ground and are now at a crossroads in regard to their future prospects as a leading program. This echoes the situation heard around the campus, particularly programs within the College of Science. However, two key elements must be pointed out: this department, as so many in the College of Science, provides a basic foundation for a vast array of programs across colleges on campus; and, this department has already achieved a level of excellence to which the university, as a whole, aspires. To permit it to slip would not only impoverish the Zoology department, but it would also weaken the preparation students receive for many other majors at OSU and remove from the university an existing building block in the quest for top tier status nationally."

She then reviewed the primary recommendations of the review committee related to the graduate program:

- Prioritize new faculty hires across the department. Work with the Dean to implement a strategic plan that will increase the number of tenure-track positions in the department and replace retiring faculty in a timely fashion.
- Develop a teaching internship program for research associates that would allow them to gain experience and develop expertise in undergraduate teaching, something that many will need for their future professional careers. These research associates would teach part of the year and conduct research part of the year (the program should be linked with some actual training in college education). This might help alleviate the faculty shortage for undergraduate teaching, and avoid many of the problems associated with adjunct faculty who only teach. By identifying this as a competitive, teaching internship program, the department can demonstrate its commitment to teaching and enhance the

- possibility that the program will be funded through grants or private donors.
- Increase stipends for graduate assistants in the department.
- Conduct regular curriculum committee meetings with a liaison from each research cluster and a graduate student representative. Include the identification of relevant graduate courses offered by other campus units and inform Zoology students.
- Continue to press for adequate funding, both internally and externally in support of facilities as well as staffing and faculty hiring.

Stevan Arnold, chair of Zoology, thanked the committee and the Graduate School for help in conducting the program review. The report, which has been widely shared in the department, was described as both careful and thoughtful. Responding to the most urgent recommendation, the department has already raised stipends, bringing them into parity with peer programs across the country.

Sherm Bloomer, dean of the College of Science, agreed both with the committee's observation that the Zoology Department is excellent, and that the issues raised in the review report are appropriate and well stated. In response to a question about the use of faculty with 100% teaching responsibilities versus faculty with combined research and teaching appointments, he indicated that the current circumstances of the university make it hard to fund enough faculty with traditional appointments to meet all teaching demands. He encouraged the faculty to search for ways to be creative in types of appointments and to help all those working in the department succeed.

A motion was made and seconded to accept the report. All voted in favor. The report will be forwarded to the Provost.

3. Category I Proposal to Create a College of Health and Human Sciences

Clara Pratt, interim dean of Home Economics, and Jeff McCubbin, interim dean of Health and Human Performance presented a proposal to create a college of Health and Human Sciences. The proposal is available on the Internet at http://osu.orst.edu/dept/academic/aa/curric/cat1s/HHP_final.doc (MS Word version) or http://osu.orst.edu/dept/academic/aa/curric/cat1s/HHP_final.htm (html version). They summarized the separation of the School of Education from the College of Home Economics and Education and the extensive discussions between the remaining departments in that college and departments in the College of Health and Human Performance for a new, combined college.

In response to questions about the response by alumni of the College of Home Economics, Clara Pratt indicated that most are excited and that she has been able to address the concerns of others. Students and faculty, on the other hand, are highly enthusiastic, both about the name change, and the opportunity for even greater collaboration between member departments.

In response to questions about the enhanced faculty interaction, Pratt and McCubbin provided an example of new research proposals and shared equipment between the Department of Exercise and Sport Science and the Department of Nutrition and Food Management. Clara Pratt also responded to questions about Extension faculty by explaining how Extension faculty have been required to join the most appropriate academic department on campus for purposes of tenure and promotion. She anticipates many of them electing departments in the new college, and this allowing enhanced participation of Extension faculty in serving on student committees and helping identify internships.

A motion was made and seconded to approve the Category I proposal to create a College of Health and Human Sciences. With all voting in favor, the proposal was approved.

4. Continuous Enrollment Policy Update

Sally Francis (Interim Dean, Graduate School) provided the Council with a revised draft of the continuous enrollment policy and reviewed changes from the previous draft. Following extended discussion, the Council agreed to bring this agenda item back for further discussion at a future meeting. Concerns were raised regarding the additional administrative workload, minimum registration requirements and the penalty associated with a break in registration.

5. Graduate Level Learning Report

At its June 14, 2001 meeting, the Graduate Council reviewed a report from a Task Force on Graduate Level Learning, which had been appointed by Dean Francis the previous year. (See minutes at). Because the Council did not have time to act on the recommendation from the Task Force prior to the end of the 00-01 academic year, the report was carried forward to the 2001-2002 agenda. The meeting on November 29, 2001, began with an introduction of the report by Vicki Ebbeck, who had served on the Task Force. Because Council members had studied the report in advance, she moved quickly to the Task Force recommendations:

"The Task Force recommended modification of policy to redefine the course numbering system as:

400

Primarily for senior level undergraduate students. Graduate students may enroll and use the credit on a graduate program of study subject to approval by the student's graduate program committee.

500

Primarily for students in master's degree programs. Qualified junior or senior undergraduate students may enroll and use the credit to satisfy requirements for a bachelor's degree.

The total number of non-blanket 400 level credits allowed on a 45-hour graduate program of study should be limited and the Task Force recommends that it be somewhere in the range of 6 to 12 credit hours.

If the Graduate Council chooses to maintain dual-listed courses, the issue of faculty work load regarding the additional burden of teaching split course be addressed by adding a credit hour for the graduate 5xx course when an additional weekly meeting separate from undergraduate activities is conducted. Instructor surveys revealed that course instructors are unaware (5%) of or minimally (49%) familiar with the requirements for additional expectations identified in the Graduate Council differentiation policy. A minimum outcome from this work is the need for Graduate Faculty to be trained concerning the University expectations for graduate teaching."

Following Ebbeck's opening remarks, the Council discussed the recommendation, including several issues that had been identified in the report. Also discussed was a recommendation from the team that reviewed Oregon State University as part of the accreditation process including a recommendation that there be "compliance with the requirement that a minimum of 50% of a graduate student's program be genuine graduate-level experience."

The Council agreed to continue this agenda item at a future meeting, perhaps at the meeting scheduled on December 6, 2001, to consider a Category I proposal for a new graduate degree in applied ethics.

6. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, December 6th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, January 24th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, February 14th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, February 28th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, March 14th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, March 28th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 11th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 25th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 9th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 23rd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, June 13th	3:00-5:00pm	650 Kerr Admin. Bldg.

Graduate Council

October 25, 2001 Minutes

Remcho (chair); Brauner, Caughey, Collins, Cull, Ebbeck, Fisk, Francis, Markle, McNair, Mishra, Niess, Prucha, Rettig, Sanchez, Watrous

Absent: Radosevich

Guests: Deborah Healey, English Language Institute; Marybeth Trevino, Office of International Education; Rachel Powell, English Language Institute

1. Discussion of Committee Charge and Procedures

Vince Remcho (Graduate Council Chair, College of Science) called for any comments or concerns about the 2001-02 Graduate Council charge distributed prior to the Sept 27 meeting. None were heard.

Prior to the Oct 25 meeting, Remcho distributed suggestions concerning voting by proxy, voting by email, and what would constitute a quorum. Council first discussed the following proxy voting procedure: "Proxy votes must be in written or e-mail form with copies to the individual to whom proxy is being granted and to the chair of the Council. The copy submitted to the chair may be edited to remove opinion or specific vote if desired by the proxy grantor; the intent is that the chair be informed in advance that a proxy has been granted and to whom it was granted."

There was no discussion; a motion was made and seconded to adopt the procedure and it passed without opposition. After the motion had passed, it was clarified that the proxy must be a voting member of the council, and it was moved that that language be amended to state this explicitly. The motion was seconded; none opposed and the motion passed. The final procedural policy thus reads,

Proxy votes must be in written or e-mail form with copies to the individual, a voting member of the Graduate Council, to whom proxy is being granted and to the chair of the Council. The copy submitted to the chair may be edited to remove opinion or specific vote if desired by the proxy grantor; the intent is that the chair be informed in advance that a proxy has been granted and to whom it was granted.

The next item discussed was a possible email voting procedure, but the Council agreed not to adopt a formal procedure, and decided that email voting should be allowed only on an item by item basis, determined by whether discussion was finished before the vote was submitted. The Council felt that, since discussion may change an opinion, allowing an individual to vote without participating in all discussion would be unfair to the presenters of proposal.

Last, the Council discussed the following possible rule for determining a quorum. "An attendance of 50% of the voting members of the council will constitute a quorum; alternatively, a quorum may consist of 5 voting members of the Council in attendance with at least one proxy vote or e-mail vote in-hand to be cast at the meeting in question."

Because of the previous decision on email voting, "or e-mail vote" was removed from the language. Because there are currently 13 voting members, the number of votes required was changed to "seven" instead of "50%." It was also decided that a maximum of two proxy votes should be allowed. A motion was made and seconded to accept the following procedure, and it passed without opposition:

A quorum will consist of a total of at least seven votes, including a maximum of two proxy votes, at the meeting in question.

2a. Category I Proposal for Forest Products to rename of MS and PhD degrees in Forest Products to "Wood Science"

Bruce Rettig (Associate Dean, Graduate School) indicated that this proposal is assumed by the Curriculum office to be uncontroversial. A motion to approve the change was made, seconded, and none opposed.

2b. Category II Proposal to change one required course in the OMSE program to an elective course

According to a letter from Mike Quinn, Computer Science Department Head, the department "proposes to change the requirements for the Oregon Master of Software Engineering degree by changing OMSE 512, Understanding the Software Business, from a required course to an elective course." This would increase the number of elective courses from two to three, and the elective credits from six to nine.

Concerns about the proposal included the following:

- Delores McNair (Graduate Student) asked how students already in the program would be affected. Rettig said he anticipated it would allow more flexibility to students, and would not adversely impact any student. Sally Francis (Interim Dean, Graduate School) agreed, and said that students are entitled to the policies of the graduate catalog under which they enter graduate school. If a student desired, s/he could choose to use the new policy instead. Paul Cull (College of Engineering) pointed out that the OMSE program is only one year old, and no student is far enough along to be adversely affected by the change.
- Mary Prucha (Coordinator of Graduate Services) asked how the language in the graduate catalog would be affected. It was unclear where OMSE 512 falls in the breakdown of currently required courses. Cull indicated that OMSE 512 is a ♦program integration♦ course. Currently, students are required to take nine credits in that area, and this proposal would drop that requirement to six credits. David Brauner (College of Liberal Arts) suggested that parties making proposals submit sample catalog re-writes in the future to avoid such confusion.
- Marty Fisk (College of Oceanic and Atmospheric Sciences) felt unprepared to vote on this due to lack of knowledge about the degree. He would like a chance to ask questions and do background research before making a decision.

A motion was made and seconded to change the requirements for the OMSE degree. One abstained from the vote and none opposed. Thus the motion passed and the change was approved.

3. Conditional (English) Admission : Reclassification

Deborah Healey and Rachel Powell from the English Language Institute (ELI) and Marybeth Trevino from the Office of International Education (OIE) were invited to explain their proposal to officially recommend students admitted as English conditional out of conditional status. International students who meet OSU academic requirements but do not score at least 550 on the TOEFL are admitted conditionally. Officially, graduate students must score a 550 on the TOEFL to be released from conditional status. Unofficially, by recommendation of ELI and by exception granted by the Graduate School Associate Dean, students who successfully complete the ELI Level 6 program are released from conditional status without achieving a 550 on the TOEFL. These courses are believed to be a more authentic form of assessment of English skills needed to succeed in graduate school than is the TOEFL. The TOEFL tests passive proficiency of listening, English grammar, etc., but by the time a student finishes level 6 of ELI classes, s/he is able to write a research paper in English. Being able to make selective recommendations to remove conditional status in this manner better serves the students and the university. Moreover, no significant difference in GPA♦s exists between those students who tested out of conditional status and those who were recommended out, indicating that recommendation is at least as good as testing as a measure of English fluency. A handout that compared scores of students, as well as guidelines for recommending them out of ELI, was provided.

The following points were made to clarify how recommendations are made:

- Neither recommendations nor the TOEFL replaces the need for the SPEAK test for international GTAs.
- ELI works closely with the major advisor and with the student. Only the most exceptional are recommended out. In the last school year (2000-01), eight received such recommendations.
- Recommending out would be the equivalent of scoring a 550 on the TOEFL. Those students whose departments require higher than a 550 on the TOEFL will still have to test out. It is possible that in the future the recommendation program may be extended to include these students.

Questions/points of discussion from the Graduate Council included:

- Doug Markle (College of Agricultural Sciences): What ELI coursework is required of conditionally

admitted students? The student's current TOEFL score determines the number of ELI hours they are required to take. The lowest scores require 9 ELI credits and 3 OSU credits; the higher scores require 3 ELI credits and 9 OSU credits

- Fisk: What level coursework are ELI classes? All ELI classes are at one level, and they are non-credit-bearing courses.
- Watrous: Have there been any failures by students who have been recommended out of conditional English status? No.
- Markle: What kind of publicity would this change be given? The Graduate School would like to change the letter sent to students admitted as English conditional, but does not anticipate changing the catalog (the current official policy of requiring a 550 score does not appear in the catalog). ELI and the Graduate School could present an amended letter to the Council for approval, if the Council so desires. The question is whether the Council endorses the intent of the recommendation procedure, and the Council is not being asked to formally make new policy or lock in how the new procedures are implemented. Remcho indicated that the Council could charge the Associate Dean of the Graduate School with keeping the new procedure under review.

Alex Sanchez (School of Education) moved that the Council accept the new guidelines provided by ELI for recommending students out of English conditional status, and that the Associate Dean of the Graduate School work with OIE and ELI on appropriate procedures to implement the new guidelines. The motion was seconded, and all approved.

4. Continuous Enrollment/Re-admission

Interim Dean Francis introduced a proposal for continuous enrollment. The Graduate School is working on a continuous enrollment policy similar to one that has been in place at the U of O for almost 40 years. The proposed policy was taken to the last Deans' Council meeting, and will be re-visited at the next Deans' Council meeting.

A policy draft was given to the Council. Currently, if student does not register for more than 2 consecutive terms, s/he must apply to be readmitted to his/her program. The proposed policy would require students to enroll continuously from matriculation to the finish of a degree, beginning in Fall 2003. The delay in implementation would allow currently enrolled students to prepare for the change. However, Dean Francis noted that some of the deans suggested implementing it right away.

The policy would require a graduate student to register for 3 credits every fall, winter, and spring term until s/he has completed the degree. It would provide for regular and planned leave of absence. Planned leave is for students in programs not designed to be sequential, and would enable students in such programs to be tracked. A masters student would be allowed up to three terms of leave (not including summers), and a doctoral student would be allowed 3 terms of leave prior to advancing to candidacy and three terms of leave after advancing to candidacy (not including summers). Breaks in registration would require a student to apply for readmission and pay what s/he would have been charged for tuition had s/he stayed enrolled. Students could appeal the amount of back tuition they owe.

The policy would encourage timely degree completion and would also allow for tracking/counting of graduate students, which is currently impossible due to numerous inactive students. Additionally, it would allow for an accurate estimate of OSU's time to degree.

Included in the proposal was a financial work-up of the policy, which was based on an estimate of 200 students. This is a rough estimate, and and was meant to be illustrative. At any given time, there are approximately 1200 inactive students.

The Graduate Council was concerned about the policy (or aspects thereof) because

- it appeared at first glance as a way to help make up OSU's current deficit.
- it represented a significant increase in financial burden on students.
- it may have limited effectiveness because of common practices of students on 12-month GRA's who often pay no tuition in the summer but use substantial amounts of faculty time and other resources during the summer. Should these students be required to register for summer as well?
- it might reduce the completion rate by students, especially for computer science students who often take employment in firms and thus do not register for a long period of time. If this is advantageous to their degree, it could be considered planned leave. However, this kind of situation is never planned for computer science students. It happens suddenly and unpredictably. OMSE staff have expressed concerns about the U of O continuous registration policy for this very reason.

it should include recognition of need for leave based on sudden serious illness.

The Graduate Council supported the proposed policy based on

- frustration with students who disappear for years and then panic to meet the 7-year deadline.
- the belief that professors would feel less obligated to spend a lot of time with un-enrolled students. Students do take up faculty time, and thus should be registered.
- the idea that waiting two years to implement the degree would give adequate advance warning.
- the fact that it accommodates summers only students, such as those in Education.
- the fact that it would back up what the School of Education already requires of its Adult Ed and Community College Education students.

The Graduate Council had the following questions about the policy proposal:

- Would a student who is only making corrections to library copies need to register? Francis indicated that the policy would not require it, but a professor might, based on how much time is spent with the student.
- How are some students registered for one or two credits (listed on the financial summary of the policy) when current OSU policy requires any registered student to register for three credits? International students are allowed a one-time exception to the threecredit rule for the term in which they are defending to keep their student visas. Students registered for two credits are likely in their last term and are not dissuaded by the penalty of future registration blocks for not registering for three credits.
- Would an "Intent to Continue" form be a more positive way to frame the "Leave of Absence" idea? Several council members supported this idea.
- Who would approve the "Leave of Absence"/"Intent to Continue"? How would the program/department be involved? Francis indicated that, like other petitions, the student's committee and department head would have to sign off, with final approval coming from the Graduate School.
- How would the duties surrounding this policy be carried out? Rettig indicated that at the U of O, it required staffing of a 0.3 FTE position to administer.
- If the primary intent is for tracking purposes, what is the rationale for requiring three instead of one credit? Francis stated that three was the standard at peer institutions, and that the current required enrollment for graduate student status is three credits. One dean did suggest reducing the requirement to one credit after a doctoral student completes his/her oral prelims.

The Council will continue discussion on this policy, and members can contact Interim Dean Francis with any further questions or concerns.

5. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, November 8th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, November 29th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, January 24th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, February 14th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, February 28th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, March 14th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, March 28th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 11th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 25th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 9th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 23rd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, June 13th	3:00-5:00pm	650 Kerr Admin. Bldg.

6. Category II Proposals approved by Associate Dean Bruce Rettig during Summer 2001, on behalf of the Graduate Council:

- Art 595: Change the number of credits and course description is approved
- Art 529: Course drop is approved
- Health 530, Health Policy Analysis: Change in prerequisite is approved
- FW 527 and FW 528: change in course numbers, which corrects errors in selecting new course numbers and otherwise does not affect courses that were previously approved by the Graduate Council, is approved.

- 01-C310: FS 533X (3) Silviculture: New course approved
- 01-C221: CE519: Course drop is approved.
- 01-C278: H 588, Occupational Safety: New course approved
- 01-C293: CSS 585: Change the title from Environmental Applications of Soil Science to M/Environmental Applications of Soil Science, to change the number of credits from 4 to variable (1-3), and to change the course description (including its availability as a course that can be repeated for credit) is approved.
- 01-C303: BA 594: The request to change the title from Marketing and Technology to Marketing Channels, to change the prerequisite, and change the course description is approved.
- 01-C295: CSS 513X, Properties, Processes, and Functions of Soils: This experimental course is approved.
- 01-C-289: PHL 530X, History of Buddhist Philosophy: This experimental course is approved.
- 01-C-294: AREC 532, Environmental Law: change of prerequisite from Graduate standing to Graduate standing and AREC 260 is approved.

Graduate Council

June 14, 2001 Minutes

Present: Tornquist (Chair), Ayres, Cull, Ebbeck, Esbensen, Francis, Markle, Niess, Radosevich, Remcho, Rettig, Smith

Absent: Brandt, Mishra, Prucha, and Young

Guests: Jack Higginbotham, Sherman Bloomer, and Gordon Matzke

1. Approval of Minutes

Steve Esbensen (Oceanic and Atmospheric Sciences) chaired the committee for the first two agenda items, after which point Sue Tornquist (Chair, Veterinary Medicine) arrived at the meeting.

A motion to approve the Graduate Council minutes from May 24, 2001 was made and seconded. All voting members present approved.

2. Graduate Level Learning

Last year, Sally Francis (Interim Dean, Graduate School) formed a Task Force, chaired by Jack Higginbotham (Professor of Nuclear Engineering and past Associate Dean of the Graduate School) to investigate the effects of 400/500 "slash" courses on the graduate level learning experience at Oregon State University and to make recommendations about ways to lessen any negative effects such course offerings may cause. Jack Higginbotham joined the meeting to present the report of the Task Force.

The Task Force's recommendation would address the issue of graduate student expectation. Senior-level courses for undergraduate majors could be acknowledged as necessary for a graduate student, and a graduate student would not expect a graduate-level class.

Other items that Higginbotham pointed out included:

- A fairly extensive survey of graduate students gave no evidence of substantial dissatisfaction with slash courses, except for students in the MAIS program where some students have strong negative OR positive feelings about them.
- Surveys of instructors who teach courses in MAIS programs provide conclusions similar to the survey of students.
- Out of the 49% of the faculty at large that responded to surveys, just five percent were unaware that graduate students in slash courses should be doing more than undergraduates, while 49% were minimally familiar with this policy. If faculty are unaware, then graduate students are being disserved in slash courses. The group most aware of the requirement for differential treatment of 400 and 500 courses were the administrators responsible for curricular review.

Questions and items for clarification raised by Council members included:

- What were faculty responses by college? With a 49% response rate, it would be interesting to know if any major colleges were not well represented in the responses. Higginbotham responded that every college was represented, and the Task Force re-surveyed those who were not represented after the first survey. Higginbotham agreed to provide a table of faculty by college as part of an addendum to the report.
- Is the solution to create another policy (i.e., allowing 400-level courses on a graduate program)?

Another solution would be to educate faculty about the appropriate requirements for graduate students in slash courses. Such education would have to be repeated annually due to turnover of faculty.

- What is the rationale behind the recommended number of credits? The majority of the Task Force recommended 6-12, while peer institutions allow 9-27. One rationale was that the majority of courses were 4 credits, so the number should be divisible by 4. The amended recommendation is for 6-22, as explained above. Higginbotham did not think it was feasible, nor would it be informative, to include all of the discussion that led to the recommendation because the Task Force had very strong, disparate opinions.
- Could 400- and 500-level courses be offered simultaneously? Higginbotham said the committee thought that was a viable option. In such a case, graduate and undergraduate students would attend the same lecture, but the instructor would offer a separate seminar, for example for graduate students. The 500-level course would have more credits so that faculty would have additional credit for their teaching load.
- The report indicates that undergraduates do have concerns about slash courses. The report could have an impact on undergraduate education, and should be provided to the Curriculum Council.

The Council thanked Jack Higginbotham and the Task Force for their hard work in generating the report.

3. Geology/Geography Graduate Program Review

Sherman Bloomer (Dean, College of Science) and Gordon Matzke (Head, Geosciences) were present for the program review committee's presentation to the Council. Court Smith (Liberal Arts) began by giving the background of the review structure. It was a joint undergraduate and graduate review with two external reviewers.

The report included both commendations and recommendations by the review committee.

- Commendation 1: The 1989 marriage of geology and geography into Geosciences has been successful. The faculty has made the marriage work in a challenging environment amidst budgetary difficulties in the College of Science.
- Commendation 2: The department boasts a high quality of teaching, research, and grants.
- Commendation 3: Geosciences has an integrating presence across campus, being critical to the success of other programs and entities including the colleges of Oceanic and Atmospheric Sciences, Forestry, and Agriculture, the Earth Information and Technology minor, the Natural Resources program, the Environmental Sciences program, the EPA, and USGS.

The committee's recommendations are all tied to maintaining quality.

- The department needs more faculty FTE. Tenure-track FTE declined during 1990s, so the department may not be able to maintain the quality it has shown in the past. The department has roughly 7-8 FTE each in geology and geography (15 total) while their peer departments with similar national standings have about 25 FTE. The department has been hiring instructors whose position descriptions do not include a research focus, but these people do not have the time, and may not have the qualifications to support instruction and supervision of graduate students. Graduate students direct their frustration with class size and teaching load at the University, feeling that it is slighting their department.
- The departmental computer facility is not adequately staffed. An employee needs to be hired to coordinate the computer system, which is important for graduate and research activities. The position cannot be combined with an instructor position because of disparate pay scales between the two positions.
- The committee recommends the department continue to solidify the marriage of the two fields of geology and geography.
- Another minor recommendation is to increase graduate-level class opportunities for graduate students. The department suggested allowing more blanket courses, but the Graduate Council rejected that proposal at the May 7, 2001 meeting. One solution they have found to student concerns over lack of graduate level material in slash courses is to offer courses as 400-level one year and 500-level the next.

The review process raised questions about University priorities and the interaction between graduate programs. In the past decade, the Department of Science and Mathematics Education has increased its FTE while Geosciences FTE has declined. Another question concerned how to include distance education in program reviews.

Matzke responded to the report, saying it was an accurate representation of the department and program,

and Dean Bloomer is intimately familiar with the department, having chaired it in the past. The review team did a good job of understanding where the department is. Last fall, the department recruited 11 of its top 13 graduate student applicants, but lack of FTE will make continued successes more challenging. The age structure of the current tenure track faculty means the department needs to start hiring now to continue with excellence.

Dean Bloomer indicated that the report contained no surprises, and included issues that most departments in the College of Science could raise. Some unexpected retirements have had a hard impact on Geosciences. Discussions about priority are beginning, but hiring decisions have not been made with departmental priorities in mind. Administrators are currently trying to fix structural problems in the College.

The Council asked that Matzke clarify his request from earlier in the spring that the Council investigate dropping the blanket-level credit limit on graduate programs. He said that seminars and other activities often offered as blanket-level are the best forms of graduate education, but their extensive inclusion in graduate programs is forbidden by the rules. He feels that eliminating the limit on blanket courses would improve the quality of graduate education.

Paul Cull (Engineering) requested elaboration about the departmental computer facilities. The facility in question is a classroom for working with GIS spatial data. It was built as teaching lab and cannot be open for student use without an appropriate supervisor, and funds to support that person are not readily available. No one is employed to manage disk space, user accounts, or do all the things necessary to make it available at other hours. No one is there to fix it if it crashes, which is not unusual with such a delicate system and so much data. From students' points of view, it is frustrating to have such an excellent facility that cannot be used. COAS, Physics, and Mathematics have been identified as units that could make good use of the facility if it were available.

After Bloomer and Matzke were thanked for their contribution, they departed. Esbensen said he would like to see a formal proposal about blanket courses that makes Matzke's opinions more clear. He did not feel he was clear about what was being proposed when he voted on it at an earlier meeting. Ayres noted that such a proposal would essentially propose asking faculty to use their best judgement about the best way to educate graduate students instead of having rules to govern them.

A motion to accept the Geosciences review was made and seconded. All voting members present voted to approve the report.

4. Entomology Follow-up Review Report

Steve Radosevich (Forestry) presented the report, which was a follow-up from a review 3-5 years ago. Chandra Mishra (Business) and Radosevich met with Mike Burke to discuss the follow-up. Entomology is under considerable reorganization within Science and Agriculture. None of the recommendations from the review committee have been met because of the tenuous state of the department, which has much more serious problems to deal with first. Deans in Science and Agriculture are working to fix the problems. After the structural problems in the department are solved, the graduate program will have a chance to fall into place. Radosevich pointed out that the graduate program is functioning surprisingly well given shape of department.

The follow-up report generated further discussion about what was happening in the department. Bruce Rettig (Associate Dean, Graduate School) asked if a department head search was underway. The department is being divided into a new department, Insect Science, and into other existing departments. Radosevich noted that there was resistance to eliminating the department in agriculture. The current plan is to distribute certain faculty to other departments that will accept them. Agriculture does want an entomology department, but with major changes and restructuring. Currently, the deans of Science and Agriculture are administering the program.

The follow-up report offered to the Council raised several questions:

- What should be the recommendation for future action?

Tornquist noted that the report recommended another, more extensive follow-up be done at least after the department's probationary period of 3 years ends. This would commit the Graduate Council to conducting another review. By that time, it will be nearly time for another full review. How many years does a newly formed program need to be in operation before it can be reviewed?

- What are the responsibilities and duties of the Graduate Council?

Sally Francis (Interim Dean, Graduate School) noted that while communicating the finding would not be particularly informative since the department and college were well aware of their problems, it would make the Council appear sensitive to its own duties in conducting follow-up reviews. Smith felt that the College and Provost needed to be informed that the department was not in compliance. Jim Ayres (Pharmacy) agreed that the Council needed to bring the report to closure, but wondered what significance it would have that the department did not comply with the recommendations of the review committee. Francis suggested recommending that the recommendations from the last review be met by the next review, if those recommendations would still be relevant. Radosevich thought that a whole new review would need to be done. The Council came to the decision to add the following sentence to the follow-up report:

We recommend that in Fall 2002, the Graduate Council will conduct a follow-up review to determine the timing for a full review.

This sentence would replace the last paragraph of the submitted report.

A motion to approve the report with the amendment above was made and seconded. All voting members present approved the motion.

5. Program review committee membership

Rettig gave brief background information about past Council discussions on this topic. Council members received a proposed revised policy, which read:

The Graduate Review Committee. The Review Committee normally is to be comprised of two members of the Graduate Council, two additional members of the Graduate Faculty, and at least one disciplinary peer external to OSU. Additional participants may be desirable, especially external members. The Dean and Associate Dean of the Graduate School accompany the Review Committee during the site visit, but are not officially member of the Committee. Assignment of Graduate Council members to a Review Committee is the responsibility of the chair of the Graduate Council. (One of the Graduate Council members should have prior experience on a Review Committee, and is designated to chair the Committee). The Graduate Dean, having received recommendations from the department chair and the college dean regarding the external members, appoints the other members of the committee. On-campus members of the Committee should be from a college other than that of the program under review. The external reviewer should be a highly knowledgeable and reputable leader in the field under review (see Appendix 1). Whereas Committee members may vary in their familiarity with the subject matter of the program, all should be well versed in the practice of graduate education.

A move to accept the proposal was made and seconded. Six voting Council members approved, none opposed.

6. Approval of June 14 Minutes

The June 14 minutes will be distributed by email to Council members, who should direct comments to Tornquist. Tornquist will approve the minutes.

7. Enrollment Break Policy

Maggie Niess (Graduate Admissions Committee) requested review of the regulation that students must reapply if they want to re-enroll after an absence of more than two terms. Re-applying means that their acceptance is not guaranteed. This policy is particularly problematic for teachers who often attend graduate school in summers only. Some exceptions have been made if teachers are identified as summers only students, but this does not always solve the problem. The 7-year window for completing a degree at the master's level, coupled with this policy, causes further confusion. Niess suggested changing the policy, which is stated on page 9 of the Graduate Catalog, to allow up to 12 months of leave before having to re-enroll. This is the policy for undergraduates.

Cull pointed out that other institutions require students to apply for leave.

Any thoughts or comments about this issue should be forwarded to Rettig, Francis, or Tornquist.

8. Thesis Formatting Requirements

Court Smith brought up this issue, which was raised partly by a student. The main issues were:

1. The advertisement of the manuscript option.
2. The requirement that a student using the manuscript format had to place a paper for which they were not the first author in the appendix of the thesis instead of in the body.
3. Requirement that a paper must be published, accepted, or submitted versus requirement that there be

plans to submit the paper. There is ambiguity in the language.

Esbensen thought it reasonable to require that a paper be submitted by the time the library copy is due. The feedback given at the exam could result in a higher quality paper. Radosevich wondered if the manuscript option was simply a structural element of the thesis and that publishing was a separate act. The issue of publishing should be separate from thesis formatting issues.

9. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, October 11th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, October 25th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, November 8th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, November 29th	3:00-5:00pm	650 Kerr Admin. Bldg.

Graduate Council

May 24, 2001 Minutes

Present: Remcho (Acting Chair), Ayres, Cull, Ebbeck, Esbensen, Francis, Niess, Prucha, Radosevich, Rettig, Smith

Absent: Brandt, Mishra, Tornquist, Young

Guests: Clara Pratt (College of Home Economics), Cheryl Jordan (AIHM), Larry Enochs (Science and Mathematics Education)

1. Approval of Minutes

A motion to accept the May 10, 2001 minutes was made and seconded; all voted to approve

2. 2001-2002 Graduate Program Reviews

Mary Prucha (Coordinator of Graduate Services) distributed a two-year forecast and timeline for upcoming graduate reviews, some of which are combined with undergraduate reviews, and some of which are joint reviews with accrediting teams such as CSREES. Seven graduate program reviews and 5-8 follow-up program reviews are scheduled for next year. To adhere to 10-year review schedule, the Graduate Council may need to reconsider review committee structure and how program reviews are conducted.

Bruce Rettig (Associate Dean, Graduate School) suggested reducing the number of Graduate Council members on review teams from two to one, with the Graduate Council member always serving as chair. Next year there will be 10-12 Graduate Council members, including four or five new members. Continuing to use two Graduate Council members per review would mean that some members must participate in more than one review next year. If review team membership was reduced to one Graduate Council member, the remainder of the team could be composed of graduate faculty members at large. In addition, one Graduate Council member and one graduate faculty member (perhaps a member of the original review team) could conduct follow-up reviews.

The Graduate Council agreed that the chair of the review committee should always be a Graduate Council member. The Council also agreed with utilizing only one Graduate Council member on each follow-up review, but indicated that including a member of the graduate faculty who had previously served on a given review was not necessary. It was argued that a fresh look at a program may be more useful. The Graduate Council did not agree that systematically reducing the number of Graduate Council members on review teams would be a good way to reduce Graduate Council workload. The main concern, voiced by Steve Radosevich (College of Forestry), was that a veteran Council member should serve as chair of every review team, and that new 2001-02 Council members would need to participate in reviews to learn the process.

Associate Dean Rettig will research the issue of graduate program review committee composition to see if changing the make-up would be new policy. If so, then a proposal to change the composition of the follow-up team will be drafted for approval at the June 14 meeting.

Another suggestion to reduce the workload on Graduate Council members for reviews concerned combined reviews with CSREES and/or accrediting bodies. Radosevich suggested that one day be set aside during the reviews (which can last as many as 5 days) for graduate programs. While others stated that this model was the one currently in use, Radosevich maintained that strong connection between research programs and graduate education meant that reviews could be incomplete if they missed much of the research information.

3. Graduate Program Review Reports

AIHM

Paul Cull (College of Engineering) presented the findings of the Apparel, Interiors, Housing, and Merchandising (AIHM) graduate program review committee. He read the recommendations from the committee's report. Clara Pratt, Interim Dean of the College of Home Economics, commented on each recommendation to provide the perspective of the college. Dean Pratt pointed out that many of the concerns raised in the report are issues that require resolution at the University level, not the college or department level. Resource allocation, an overriding issue in the report, is not up to the dean of a college, nor is it up to a department. Slash courses have also been recognized as a University-wide issue, also tied up in resource and faculty availability. She spoke of the level of commitment of the AIHM faculty to each other and to the students, and reflected on the remarkable way in which the department has been able to accomplish much and establish a strong reputation in its field despite its limited resources. She questioned the practicality, but not the value, of exploring a professional master's degree with the current resource base, and she agreed that space for graduate students needed to be improved.

Overall, Dean Pratt felt that the program review produced a good report with strong recommendations. She thanked the review committee and assured the Council that AIHM will work toward meeting the recommendations as much as possible.

A final concern raised by Cheryl Jordan (Interim Head, AIHM department) was the issue of web-based courses. AIHM is encouraged to offer web-based courses that students from other universities can take, but OSU students are disadvantaged by OSU web-based courses because the credits involved in them cannot count toward the required 12 credit hours of state-supported instruction for tuition remission. This results in different pricing for the same course, dependent upon whether it is taken via the web or in a traditional format.

After Dean Pratt Cheryl Jordan left the meeting, the Graduate Council discussed the report. The prominence of resource allocation in Dean Pratt's comments and in the review led to Sally Francis (Interim Dean, Graduate School) informing the Graduate Council that a content analysis had been done on resource-related issues in the past 2 years of Graduate Council reviews. She intends to address this analysis to Provost Tim White. Dean Francis will send the analysis to the Graduate Council for their input, which will help communicate the issues to Provost White.

A motion to accept AIHM Review Committee Report was made and seconded. The eight voting members present voted to accept the report.

Science and Mathematics Education

Steve Esbensen (College of Oceanic and Atmospheric Sciences) presented the findings of the Science and Mathematics Education (SMED) graduate program review committee. He focused on the summary of the report, which included major findings and recommendations. Esbensen reported that the department was functioning at a high level and was delivering a strong program. National associations recognize the program for its outstanding scholars, and it ranks in the top ten such programs in Ph.D. production nationwide. The graduate students express happiness and optimism about their future job prospects.

A major issue facing SMED is the new education redesign initiative on campus. The review committee, the SMED faculty, and the dean of the College of Science strongly feel that SMED should remain in the College of Science. Compelling reasons for this opinion include College of Science investment in the program, budget expansion by SMED through externally funded research that has been made possible by their location in the College of Science, faculty focus on science content, and the student opinion that it makes the program more attractive. SMED could stay in the College of Science and still benefit from the education redesign initiative. The external reviewer pointed out courses in the education unit that could enhance the SMED program from other programs in the School of Education.

Improvements in the SMED program can be made in the areas of communication with graduate students, prioritization of objectives, and possible reorganization of decision-making. Ways that the College of Science and the University could help the program include hiring new faculty with expertise in college education, acquiring new state-of-the-art educational computing and audio-visual recording equipment, and new library resource materials.

Larry Enochs (head, SMED department) responded to the report, thanking the review committee for its effort. All SMED faculty members have seen the report and all agree with it. Enochs found no problems with any of

the recommendations, and agreed that communication has been a challenge. He fully endorsed the recommendation for new faculty to fill specific needs , and indicated that, since the report was developed, one faculty member has decided to leave the University. Some discussion arose about how the reduction of faculty from six to five would impact the program. Expansion of the teacher licensure program will be extremely difficult. Relying too heavily on clinical instructors (mentor teachers) could compromise program quality, but external funding is available for clinical instructors. The course load for faculty will likely be increased next year.

After Enochs departed, Esbensen noted some minor editorial revisions that should be incorporated into the final report. A portion of the report about teacher licensure also needed revision, and the revised text was presented to the Council. A motion was made and seconded to accept the report in amended form, and all voting members approved the motion.

4. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, June 14th 3:00-5:00pm 650 Kerr Admin. Bldg.

Graduate Council

May 10, 2001 Minutes

Present: Tornquist (Chair), Cull, Ebbeck, Esbensen, Francis, Markle, Niess, Prucha, Remcho, Rettig

Absent: Brandt, Mishra, Radosevich, Smith, Young

1. Approval of Minutes

A motion to approve the minutes from the April 26, 2001 Graduate Council meeting was made and seconded. All present voted to approve the minutes.

2. Program Review Issues

Associate Dean Bruce Rettig (Graduate School) introduced the topic of program reviews. During the summer, he, Interim Dean Sally Francis (Graduate School), Mary Prucha (Coordinator of Graduate Services), and Bob Burton (Assistant Vice Provost for Academic Affairs) will meet to discuss upcoming reviews. The discussions may include ways to restructure or fine-tune the process, although some Council members expressed concern that changing or complicating the procedure might hinder an efficient start early in 2001-02. Instead of discussing changes to the guidelines, which could increase the burden on fall reviewers, the discussions will include ways to simplify the process and reduce the burden on Graduate Council members and external reviewers. Associate Dean Rettig extended an invitation to Council members to join the meetings and provide input. Those interested would be alerted about meetings taking place during the summer.

As many as three program reviews could take place in Fall 2001, which is an unusually high number for the fall quarter. Thus, organization will be crucial early in the year. Ideally, reviews need to be scheduled before the spring to avoid a time crunch for getting the reports finished before the end of the academic year. Seven need to be done per year to keep up with a ten-year cycle, and seven are planned for 2001-02, with as many as three in the fall and four in the winter. Tentative preliminary assignments for the Fall 2001 review teams will be made by June 14.

3. Summer processing of Category II requests

Associate Dean Rettig reviewed the discussion from the last Graduate Council meeting about Category II proposals during the summer. Before 2000, a Category II subcommittee continued to function throughout the summer. Last summer, the responsibility was delegated to Associate Dean Jack Higginbotham. When he left his position, Interim Dean Francis reviewed Category II ♦s until Associate Dean Rettig was appointed. Only about ten or twelve proposals came through during the summer.

Associate Dean Rettig asked how the Council would like to handle Category II proposals this summer. Vince Remcho (College of Science) suggested using the same model as last year, with Associate Dean Rettig delegated to review and act on Category II proposals. He should have a designated Council member to consult in case of questions or additional needs for discussion. Current subcommittee members include Jeanette Brandt (Home Economics), who is retiring, Paul Cull (Engineering), who is unavailable during the summer, and Chandra Mishra (Business). If Dr. Mishra is unavailable during the summer, other volunteers for consultation will be identified at the June 14 meeting.

4. Graduate Program Review Follow-up Reports

The follow-up report from Entomology was provided to Council members, but Steve Radosevich (Forestry) and Dr. Mishra, who did the follow-up review, were not present. The Council will discuss the report at a later meeting. In short, it has been recommended by the dean of the College of Science that the Entomology department be changed significantly, so it is unlikely that the follow-up report will have more than a minimal impact. In two to three years, the Council should conduct another review to see if the changes have remedied

problems in the program. Council members should read over the report in preparation for a future meeting.

At the next meeting, a report on the AIHM review will take place. The review report draft for Science and Mathematics Education is ready, and the presentation of the report is expected on May 24 or June 14.

5. Graduate Certificate Implementation Issues

A revision of a previously approved policy statement about graduate certificate programs was provided to Graduate Council members. The earlier version had been passed by the Graduate Council, the Curriculum Council, and the Faculty Senate, and is waiting for action at the state level. However, upon reviewing the policy, admissions and registrar personnel saw need for change in the language to indicate that certificate students were credential-seeking graduate students instead of non-degree students. The reason for the change is that a non-degree student cannot, by definition, be certified with a credential after completing a program. The revised policy reads:

The Graduate Certificate Program at Oregon State University is a structured progression of graduate level courses that constitute a coherent body of study with a defined focus within a single discipline or a logical combination of disciplines. It is designed for a student who has completed a baccalaureate degree and is in pursuit of advanced-level learning. Graduate certificates reflect the educational mission of the University. All certificate programs require a minimum of twenty-four (24) graduate credits with a cumulative grade point average of 3.00 or greater. Students desiring a graduate certificate must be admitted to the University as a credential-seeking graduate student, but are not required to be on track for a specific degree. There is no formal committee requirement for graduate certificates. Certificate students are subject to all general policies governing the courses for the Master's Degree.

Under the revised policy, if a student enters the University as a non-degree student and then changes his or her status to certificate-seeking, he or she can transfer only eight credits of those taken as a non-degree student. He or she is required to earn 2/3, or 16, of the 24 required credits after declaring certificate-seeking status.

For admissions purposes, someone wishing to pursue a graduate certificate would apply for graduate status, but need not meet institutional requirements for graduate admission. There could be a quick-admit process without intensive evaluation. If certificate students later want to become degree-seeking graduate students, they would then require a more extensive evaluation process.

It was unclear how to amend the policy since it had already progressed to the Oregon University System. Dean Francis suggested simply channeling it through the normal process of Graduate Council, Curriculum Council, and Faculty Senate, and then sending it on to OUS. Approving the change will provide clear guidance to those who plan to propose certificate programs (Category I proposals).

A motion to approve changes to the policy for graduate certificates was made and seconded.

Douglas Markle (College of Agriculture) asked what impact the certificate program might have for K-12 teacher certification. It would not have any impact on licensure, which requires a master's degree, but may be considered continuing education or professional development.

All present voted to approve the changes.

6. Conditional Admission Requirements

The discussion from the last meeting about changing the requirements placed on conditionally admitted students was reviewed. The new, proposed language would state that a graduate student must maintain both a 3.00 cumulative grade point average on all work taken as a graduate student and a grade of B (3.0) or better in the first 18 hours of graded graduate credits. The old requirements stated that a conditionally-admitted student achieve a cumulative 3.25 or better on the first 18 credits of grade course work for which they registered. If approved, letters sent to conditionally admitted students would be modified to reflect the new guidelines.

One Council member asked about possible exceptions, for example, in a case where an otherwise successful graduate student achieved an F in an undergraduate activity course. Associate Dean Rettig explained that when students do not meet conditions, the Graduate School consults with the graduate program coordinator or department head/chair in the student's department. In such a case, the coordinator may request an exception. Another possible cause for consultation with the department would be if a student achieved a B- instead of a B in a course during his or her first 18 graduate credits.

Paul Cull asked if this issue was one of policy or procedure. Currently, nothing is written about this anywhere, and it has been considered operating procedure that the Graduate Admissions Committee (GAC) uses. The GAC has asked the Graduate Council to take formal action because they would prefer the policy to be codified.

A motion was made and seconded to adopt the proposed changes to conditional requirements.

Steve Esbensen (Science) suggested an amendment to the wording, making it read: "...and a grade of B (3.0) or better in each course of the first 18 hours of graduate credit."

The amendment was approved, and the six Council members present voted to pass the proposal; none opposed it. This policy will be implemented as soon as possible, and will also be retroactive. That is, as the Graduate School audits students conditionally admitted with the old requirement, they will be changed to regularly admitted (or provisionally admitted if relevant) when they meet either the old or the new criterion.

7. Posthumous degree criteria

A new proposed draft of the posthumous degree policy was offered:

Graduate degrees and certificates may be awarded posthumously in cases when the student would likely have completed the degree or certificate had it not been for the intervention of death. Generally, this means that all requirements would have been completed during the term when death occurred. Completion of degree requirements during the current term must be verified by the signature of the student's graduate advisory committee on the Report of Final Exam form.

Dean Francis provided a letter that she considered a model of how this policy might take effect. The letter was from a major professor of a graduate student who recently passed away. The new policy and the letter include key components, such as stating that the student would likely have completed the degree and that all requirements would have been met. The word "generally" reflects judgement and flexibility. Everyone on the student's committee supported the case in the model letter. In this case, the student's major professor compiled evidence, samples of work, and abstracts. The graduate committee met and agreed that the student had completed a sufficient amount of work to receive the degree. The letter reflects the intent of the Graduate School to first place the issue in a graduate committee's hands.

It was suggested that the last phrase indicating that committee members would sign the Report of Final Exam form be removed. A signed letter from committee members would be attached to the unsigned form.

A motion was made and seconded to accept the proposed language and policy, with the removal of the statement about the Report of Final Exam form. All six Council members present approved the motion; none opposed. The approved policy reads:

Graduate degrees and certificates may be awarded posthumously in cases when the student would likely have completed the degree or certificate had it not been for the intervention of death. Generally, this means that all requirements would have been completed during the term when death occurred. Completion of degree requirements during the current term must be verified by the signature of the student's graduate advisory committee.

8. Blanket-numbered course limits

Current policy, taken from the Graduate Catalog, states that,

No more than 6 credits of blanket-numbered courses, other than thesis (or research-in-lieu-of-thesis for non-thesis programs), may be applied toward the minimum 45-credit master's degree; and no more than 15 may be applied toward the minimum 108-credit doctoral program. No more than 3 credits of blanket-numbered courses in each field of study may be used in the MAIS program; thesis credits or research paper credits are exempt from this limitation. Blanket-numbered transfer courses will count toward these maxima.

At the recent Geosciences Program Review, the chair of Geosciences, Gordon Matzke, expressed dissatisfaction with the policy and requested that the Graduate Council consider increasing the limit. Blanket-numbered courses include projects, research, seminar, and reading and conference. In Geosciences there are often course opportunities that involve only a few numbers of students, not enough to make a course. Associate Dean Rettig interpreted Professor Matzke's request as a need for more flexibility for offering courses.

[Professor Matzke subsequently clarified his comment, indicating that his concern was for the lack of

opportunities for students to use the seminar format in place of structured courses, given the blanket number credit restriction.]

Dr. Cull suggested a solution to Geoscience's problem: Use a Selected Topics course number, which can have varying topics. Another option when courses don't have enough students registered is for the professor to attest that the blanket-numbered course had a syllabus, was structured, and had assigned coursework. In such a case, individual exemptions could be made to the limit on number of blanket-numbered credits.

Dean Francis wondered how effective the policy was if there were so many ways around it. Another concern was that no curriculum review exists for Special Topics courses. Are students really getting a significant number of real courses?

The Council did not feel that the issue needed to be debated further, and all members were generally in favor of current policy.

9. Other Business/Announcements

Dean Francis invited volunteers from the Council to help with double-checking the doctoral student line-up at the June 17 Commencement ceremony.

Future meetings of the Graduate Council are scheduled for:

Thursday, May 24th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, June 14th	3:00-5:00pm	650 Kerr Admin. Bldg.

Graduate Council

April 26, 2001 Minutes

Present: Tornquist (chair), Ayres, Cull, Ebbeck, Francis, Niess, Markle, Prucha, Radosevich, Rettig

Absent: Brandt, Esbensen, Mishra, Remcho, Smith, Young

1. Approval of Minutes

A motion to approve the minutes from March 8, 2001 and March 22, 2001 was made and seconded; all present approved.

2. Graduate Program Review Follow-up Reports

Sue Tornquist (Graduate Council Chair, Veterinary Medicine) presented the follow-up report for the Marine Resource Management (MRM) program review in the absence of review committee chair Jeanette Brandt (Home Economics and Education). The follow-up took place December 11, 2000. Jim Good (MRM), Laurie Jodice (MRM), Irma Delson (COAS), Dr. Brandt, and Dr. Tornquist were present at the follow-up. Dr. Good had prepared a document addressing the recommendations found in the program review. Dr. Tornquist went over the major points of the report, which is attached to these minutes in its approved form. She summarized the follow-up report by saying that the program has made an honest attempt to respond to the recommendations made at the program review. There are some recommendations that they are unable to meet (due to lack of resources for faculty research and the need to rely on courses in other departments, for example), but the program seems to be doing well; student numbers are up and financial support for graduate students is good.

The Graduate Council asked for a few points of clarification in the report. The statement that there were five new fisheries students reflects an increasing interest in policies to address public concerns about declining marine fisheries, especially interest in the development of marine reserves. Although the marine resource management program has a long history of work with fisheries, most students in recent years have been most interested in environmental management in the coastal zone, and have shown a special interest in developing skills with geographical information systems. Listing of two new courses designated MRM 525 was questioned until it was determined that they were both Special Topics. The numbers of current faculty members did not seem to add up-the total increase in number was 11, but the report claimed they hired 12 new faculty. It was explained that one faculty member had left during that time. Last, several typographical errors were detected.

A motion to approve the follow-up report, with corrections and clarification, was made and seconded. Six voted to approve, and none opposed.

3. Discussion of recent and upcoming agenda items and program reviews

Bruce Rettig (Associate Dean, Graduate School) provided a handout listing challenges to the Council concerning program reviews and other issues. The main concern is how to effectively wrap up major issues by the end of the current academic year. One category of upcoming agenda items is program reviews: three program reviews (AIHM, Geosciences, and Science and Math Education) have taken place, but the reports are in draft form. The reports may be available 24 May 2001 or 14 June 2001, or they may need to be moved to next year. Moving them to next year would not be desirable.

With the prospect of much business to finish this quarter, Associate Dean Rettig elicited thoughts on how to bring these issues to a close. He suggested polling Council members about their schedules in the last weeks of the term to be sure that there will be attendance at important meetings.

Jim Ayres (Pharmacy), who participated in the Science and Math Education program review, noted that no serious or controversial issues arose during that review. He suggested that presenting that report could be a lower priority, and thought that if other reviews also did not require immediate changes, then they, too, could be reported next year. However, Maggie Niess (Graduate Admissions Committee) noted that the education program is currently under review and revisioning, and that could seriously impact the Department of Science and Math Education. She emphasized that it would be important to have the Science and Math Education report to Provost Tim White in a timely manner. It was agreed that the Science and Math Education Program Review would need to be completed before the end of the Spring Quarter, but the other program reviews would not have highest priority among upcoming agenda items.

Discussion of upcoming reviews continued. The Agricultural and Resource Economics review has been rescheduled for Fall 2001. Two other reviews are also scheduled for Fall term. Thus, the first fall Council meeting may include planning for those program reviews. Any ideas for revising the review process and the guidance document should be considered before the first fall meeting. Some possible changes might include increasing membership on the review team of non-Graduate Council graduate faculty and giving clearer guidance to external reviewers. Dr. Tornquist stated that the current system was not working well, either because of the make-up of the review committee or because of the number of members. The fact that the Council is behind on reviews indicates that there is need for reform.

Mary Prucha indicated that implementing combined reviews (either including graduate and undergraduate programs or combining reviews with CSREES reviews and accreditation visits) makes reviews more complicated and also affects scheduling. The combined review approach sometimes results in confusion over who should be leading the review process. Steve Radosevich (Forestry) asserted that such reviews, e.g. those that are combined with accreditation, may take longer and be more complicated, but they often mean that more information is gathered.

Questions arose about the timing of reviews. Mary Prucha (Coordinator of Graduate Services) explained that there is a 10-year cycle, but the Council has fallen behind in keeping up with it. A two-year forecast is given to departments, many of which prefer to have their reviews in winter and spring. Delaying program review site visits to winter or spring often means waiting 6-9 months to get the results of the review to the Provost since Council action is not taken during the summer months. It was questioned whether fall reviews should be imposed upon departments.

Associate Dean Rettig will research how other schools do their reviews, and he suggested a subcommittee of the Council use time during the summer to look into the matter further.

The last program review issue concerned the Master of Arts in Interdisciplinary Studies review, which is scheduled for 2001/02. This review process is complicated by the fact that there is no MAIS department or director. The Graduate School administers the program. Associate Dean Rettig gave a brief history of the MAIS program and how it originated from a Master of Arts in General Studies. It currently requires three fields of study in at least two departments; one field must be in the College of Liberal Arts (CLA). The Graduate School began looking for leadership in this review in the College of Liberal Arts since that is the only college in which MAIS students are required to have one of their fields, but has been unsuccessful. CLA is the heaviest user of the program since many departments in CLA do not have their own graduate degrees. The last time MAIS was reviewed, the abbreviated self-study document was prepared by the Graduate School. It included mostly statistical and historical data, but did not include an in-depth analysis of the program. One suggestion was a partnership between Graduate School and CLA for the self-study document. Additionally, any department that participates could be asked to offer data on their students. It was concluded that the Graduate School will be heavily involved in the preparation of the self-study and will need to elicit a great deal of input from CLA, as well as some input from other departments who use the program.

Besides program reviews, another issue for the summer issues is whether a functioning subcommittee is needed to deal with Category II proposals. Summer 2000 was the first summer that approval of Category II proposals was delegated solely to the Dean of the Graduate School. It was suggested that Associate Dean Rettig assume that responsibility again, with the option of an ad hoc subcommittee in the event of a controversial proposal. The discussion was tabled until a meeting where more members are present.

4. Graduate Admissions *Narrative transcripts*

Dr. Niess introduced this topic, which was revisited from the 25 January 2001 meeting. The Graduate Admissions Committee (GAC) is still reviewing narrative transcripts and students who have narrative transcripts are still issued Advanced Notices of Rejection (ANRs) automatically. The GAC feels

inadequate to assess the quality of narrative transcripts. The GAC hopes the department supporting the student will provide evaluation. The GAC requests that departments provide formal review of narrative transcripts and be responsible for making an admit decision based on them. The GAC would make a qualitative rather than a quantitative evaluation of the transcript to assure standards for admission have been met.

If the supporting department is responsible for assessing the acceptability of the work on the non-graded transcript, then this, in effect, shifts responsibility for evaluating transcripts to the departments. One option is an addendum to the Departmental Action Form (DAF) that has space for indicating if the narrative transcript is acceptable or unacceptable, and space for comments.

The issuance of an ANR often sends a signal to applicants that is undesirable. It was suggested that the GAC could instead communicate that an admit decision was pending review of the transcript.

Mary Prucha sought to clarify catalog text she had drafted based on the 25 Jan 2001 minutes. Proposed catalog text reads, ♦Students whose baccalaureate degree is awarded by an accredited institution that issues non-graded transcripts will be considered for admission with the support of the department♦s written evaluation of the quality of the student transcript record.♦ The proposed text implies removal of the automatic ANR process. However, this has not been communicated to the Office of Admissions.

It was concluded that three forms need to be available to supporting departments: a DAF, ANR/DAF, and a Narrative Transcript DAF. Departments also will need to be instructed about new procedures. The matter was a procedural one at this point, given that the proposed catalog text accurately reflected the intent of the Council♦s 25 January 2001 action. Therefore, the GAC will no longer review narrative transcripts as a routine. The Office of Admissions will need formal evaluation from departments in case they are challenged on an admit decision. The issue is thus resolved as far as the Graduate Council is concerned.

Conditional admission requirement

The current requirement for conditionally admitted graduate students to become regular graduate students is that the student must receive a 3.25 in the first 18 graded graduate hours as an admitted graduate degree-seeking student. Some argue this practice is unfair in that it expects more of conditionally admitted students than of regularly admitted graduate students. Dr. Niess suggested a different requirement for consideration: a B grade (3.0) in each course they attempt until they have achieved 18 credits. According to Niess, the GAC♦s discussion did not distinguish between graduate and undergraduate credits; they were mostly concerned with changing the 3.25 requirement. A question arose concerning students possibly achieving less than a B (3.00) on undergraduate pre-requisites, if the conditions applied only to graduate credits. In this case, the student's cumulative GPA may be less than a 3.0. Requiring a 3.0 cumulative GPA might be more rigorous. Dr. Radosevich suggested changing the practice to require a 3.0 cumulative GPA on all work taken as a graduate student and a B (3.0) or better in the first 18 hours of graded graduate credits. This suggestion will be revisited at the next meeting in which there is a quorum present to make it policy, if approved.

5. Graduate Admissions Task Force Update

Associate Dean Rettig provided part of a draft report of recommendations from the Graduate Admissions Task Force. The draft was dated early March 2001. The Task Force identified three possible options for revising the admission process: A. Keep the current procedure; B. Move to a procedure in which admissions materials are "forwarded directly to departments who have the responsibility to follow up on incomplete applications and make the first decision;" or C. Offer option B to departments "who require more central support" and also offer a more "department-centric procedure that turns all of the time-critical steps completely over to the department and is appropriate for departments needing the greatest possible competitive advantage." The Task Force, along with Sally Francis (Dean, Graduate School) and Bob Bontrager (, Assistant Provost for Enrollment Services, will meet with each college in May or June to explain the three options and identify the preferred method for each academic unit. Bontrager and Francis will use information gathered from these meetings for decisions about changing the process. A revised draft of the entire report will be available before the meetings begin. Dean Francis noted that the email inviting departments to meet incorrectly indicated that option B was favored by the Task Force. In reality, the Task Force remains impartial on the matter.

6. OSU Accreditation Recommendation

Associate Dean Rettig distributed an article from OSU This Week on the report from the April 18-20 accreditation visit of the Northwest Association of Schools and Colleges. The article lists major commendations and touches on recommendations. One recommendation was reducing reliance on 400/500

"slash" courses. The evaluation team reported that graduate students do NOT think they are getting graduate level learning in these slash courses. But some Council members have gotten a more favorable impression from graduate students. The Graduate Learning Group has been initiated to address the issue, and Jack Higginbotham (Engineering) will share the report of this group on May 24. Another issue raised by the report concerns assessment. In the future, every graduate program may need to identify intended outcomes of graduate programs, and then perform a check to see if those outcomes were met. The Council should expect these issues to come up at future meetings.

7. Other Business/Announcements

Future meetings of the Graduate Council are scheduled for:

Thursday, May 10th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 24th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, June 14th	3:00-5:00pm	650 Kerr Admin. Bldg.

The following Category II proposals have been approved by the Council:

01-C138

CSS 598

This new course is approved.

PS 500

This course, formerly taught as PS 300, is approved as a graduate course.

01-C120

PS 511

This course, formerly taught as PS 311, is approved as a graduate course.

01-C122

PS 546

This course, formerly taught as PS 346, is approved as a graduate course.

01-C125

PS 556

This course, formerly taught as PS 351, is approved as a graduate course.

01-C126

PS 513

This course, formerly taught as PS 313, is approved as a graduate course.

01-C127

PS 574

The change in title and course description for PS 574 is approved.

01-C171

PS 589

The proposal to drop PS 589 is approved.

01-C170

PS 524

The proposal to change the prerequisites for PS 524 is approved.

01-C129

FW 515X

This proposal to offer FW 515X as an experimental course is approved.

01-C156

AREC 612

The proposal to change the number of credits for AREC 612 from 3 to 4 is approved.

01-C157

AREC 613

The proposal to change the number of credits for AREC 613 from 3 to 4 is approved.

01-C140

AREC 541

The proposal to drop AREC 541 is approved.

01-C142

AREC 553

The proposal to change the prerequisite for AREC 553 is approved.

**Appendix:
GRADUATE COUNCIL FOLLOWUP REVIEW OF
MARINE RESOURCE MANAGEMENT
GRADUATE PROGRAM OF THE
COLLEGE OF OCEANIC AND ATMOSPHERIC SCIENCES (COAS)
December 11, 2000**

On December 11, 2000 a follow-up review of the Marine Resource Management Graduate Program was held. Jim Good, Director, Laurie Jodice, Assistant Director of MRM and Irma Delson, Director of Student Services represented COAS. Jeanette Brandt and Susan Tornquist represented the Graduate Council. Jim had prepared a document, ♦ Marine Resource Management Graduate Council Review, December 11, 2000 Followup, ♦ that listed each of the recommendations made in 1997 under which work thus far was discussed. From Jim♦s document and our discussion we found MRM is making formidable progress in meeting the recommendations. Specific points are as follows:

1. Need for additional faculty with an MRM focus and resources to provide relevant research opportunities for students and too much dependence on the director, Jim Good.
 - There is a continued lack of resources for faculty FTE in COAS
 - There has been discussion about hiring a Fisheries Oceanographer and a Coastal GIS specialist, indicating other disciplines are becoming more aware of the need for faculty FTE in MRM
 - There has been discussion about moving to co-directors
 - There were five new fisheries students this fall, all of whom should have some funding through fisheries management faculty
2. COAS central administration should explore collaborative research opportunities with faculty from other colleges who are members of the MRM faculty.
 - No activity
3. Program should find funding for top students
 - For 2000-2001, there are 13 new graduates students. Five have Oregon Laurels scholarships, 4 are receiving tuition assistance through a GRA, one students is on a Fullbright Scholarship, 4 of 7 second year students have a GRA or GTA.
4. MRM program should develop a seminar series using speakers from outside the University
 - The program has added a non-credit lunch speaker series. It includes speakers from OSU and outside. First year students are required to attend.
 - There have been more outside speakers in the MRM orientation seminar
 - In the summer of 2000, COAS administration supported lodging for 10 students to attend The Coastal Society Conference in Portland, OR. MRM had a strong presence at this meeting and organized an Alumni/Student gathering to enhance interaction between students and potential employers.
5. Many courses attractive to MRM students are offered during Spring Term.
 - This is difficult to solve because COAS has no control over what other departments offer and when the classes are scheduled.
 - MRM offered and Estuarine Science and Management course in winter, 2000 and will offer Marine Reserves for Winter, 2001.
6. New faculty advisors are needed for MRM students
 - The number of MRM faculty has increased from 20 in 1997 to 31 in 2000. Of the 12 added faculty, 5 are courtesy, 5 are adjunct and 2 are COAS faculty. A few other faculty have been added for one time appointments to work with individual students. Another faculty member will be added soon.
7. New research faculty are needed for the MRM program
 - Answered in #1

8. MRM curriculum should be assessed on a regular basis to serve the professional needs of students.
 - MRM 525 Estuarine Science and Management and MRM 525 Marine Reserves have been added.
9. The core curriculum should include graduate level management-type courses.
 - Jim Good teaches Coastal Resources Management. Although this is not a required course, about 80% of students take the course.
 - All students learn management concepts within courses that they take.

Additional comments:

Increased recognition of MRM faculty within COAS has been achieved by adding them to the COAS faculty directory

The MRM's 25th anniversary in 1999 was marked by recognition of alumni and donations to the program have increased since then.

Jim Good, program director, feels that all faculty in the MRM program contribute to the program and that there is an atmosphere of congeniality.

Graduate Council

March 22, 2001 Minutes

Present: Cull, Francis, Markle, Mishra, Niess, Prucha, Radosevich, Remcho, Rettig, Smith, Tornquist

Absent: Ayres, Brandt, Ebbeck, Esbensen, Young

Guests: Charles Neyhart and Fran Saveriano from College of Business

1. MBA Program Design:

Charles Neyhart (College of Business) presented the Category I proposal for restructuring the Master of Business Administration (MBA) program. The restructuring responds both to a recent graduate program review conducted by the Graduate Council and an accreditation site visit, which presented similar comments about missing program direction.

A general purpose MBA has been offered since 1965. Although the new design continues to permit a general purpose degree, it adds a strategic thrust of technology. New aspects of the program include a curriculum guaranteed to be more advanced than the undergraduate level through the elimination of "slash" courses (class sections with both undergraduates and graduate students enrolled). The new program provides expanded graduate education partnership with other colleges on campus, including engineering, science, and agriculture, which may find the program a good 5th year of study. Targeting such groups may help increase enrollment in the program. Dr. Neyhart pointed out a diagram on page 3 of the proposal that illustrates the basic pyramid structure of the program: Foundation courses form its base, and integrative projects are at the apex. He also pointed out considerations used in course design, including technology, contemporary business issues, student interactions with business, innovation, soft assets, deadline experiences, interface with other courses, international aspects, and contribution to the integrative project. The curriculum is designed for a 1-year, 15-hr/term curriculum. Efforts have been made to accommodate part time students as well. Oral examinations are tied to the integrative project.

The Graduate Council asked for clarification on some points, and Dr. Neyhart added the following information:

- With the integrative project, all the credits are applied in the spring term when it is finished, but students work on it throughout the year. All courses provide input for the plan. Faculty members will monitor progress on each student's project throughout the year.
- Part time students may work independently, or arrangements may be made for them to form teams with other part time students. They will get the same material through their courses as full time students.
- Students in certificate programs would be eligible to take 500-level courses.
- For students who want a business degree in addition to another degree they are pursuing, a minor would be the best option. It would not be practical in most cases to do both this MBA program and another due to time constraints and workload. However, this program will not be any more difficult to combine with another than the former MBA program.

After Dr. Neyhart and F. Saveriano departed, the Graduate Council had time for discussion; there was none. A motion to approve the new MBA program design was made and seconded. All present voted to approve; none opposed. The motion passed.

2. Posthumous Awards of Graduate Degrees

Interim Dean Sally Francis (Graduate School) opened discussion by stressing the importance of having a

policy in place, and making sure that it is clear about what constitutes ♦sufficient progress♦ for a deceased student to be awarded a posthumous degree. ♦Substantially completed♦ is too vague. More specific criteria would be that current coursework would have completed the degree or that the student could have completed and defended the thesis in the current term. Operational language would minimize judgement needed when cases arise, while recognizing that there would be exceptions.

Two drafts submitted for discussion read as follows:

- 1. Graduate degrees may be awarded posthumously in cases when the student would likely have completed the degree had it not been for the intervention of death or debilitating illness. Generally, all course work, comprehensive examination, and thesis draft (where applicable) should have been completed.*
- 2. Upon learning that a graduate student has died, the Dean of the Graduate School will consult with the major department or program to determine whether the student is eligible for a posthumous degree. The Dean of the Graduate School shall inquire of the major department whether the student, upon satisfactory completion of current course enrollment(s), would have satisfied requirements for the degree, and whether a thesis or dissertation would have been required for graduation. If a thesis or dissertation would have been required, the Dean of the Graduate School shall consult with the chair and members of the thesis or dissertation committee to determine whether the student could have completed and defended the thesis or dissertation during the current term. If the student possessed appropriate academic credential sat the time of death, the Dean of the Graduate School shall recommend that the University President authorize the posthumous issuance of the appropriate degree.*

During discussion, the following issues were raised:

- The University President does not need to authorize the degree. At the June meeting of the Faculty Senate, a posthumous degree would be authorized in the same manner as all other degrees.
 - A combination of the two discussion drafts would be ideal. The first part would confirm that OSU does grant posthumous degrees; the second part would specify requirements for issuance.
 - Some concern was expressed about the "current term" stipulation since a graduate degree is more product-oriented than time-oriented. Steve Radosevich (Forestry) suggested changing it to "current year," saying the "current term" was too restrictive. Associate Dean Bruce Rettig (Graduate School) asked how that would work with 1-year degrees. Dr. Radosevich suggested an alternative in which the requirement would indicate which steps of the graduate program (such as program meeting, preliminary exam, etc.) had been completed.
 - Court Smith (Liberal Arts) stated that a student♦s graduate committee should decide whether the degree should be granted, not the graduate school dean. The committee or advisor should be asked if they would have signed the form if the person had not died. Using such language as "possessed enough academic credentials at the time of death" or "academic progress" could be used. No reference to time for completion need be made, and committee members could consult with the Dean of the Graduate School if they have questions about how to determine what is considered "substantial." Moving the responsibility to the committee would solve the problem of differences in disciplines, and would give committees freedom to be compassionate. Dean Francis stated that the line in the discussion draft about consulting with major department or program could be changed to advisor or committee. Dean Francis requested further guidelines for committee members that are not sure how to answer the question
- /ul>

Dean Francis will revise the discussion draft for a Graduate Council meeting in the near future.

3. Graduate Program Review Follow-up Reports

Jeanette Brandt (Home Economics and Education) and Susan Tornquist (Veterinary Medicine) will present the Marine Resources Management follow-up report for the next meeting. Dr. Radosevich will work on the follow-up study of the Entomology program on the 30th, but because Entomology does not have a department head, he will meet with Mike Burke, Associate Dean of the College of Agricultural Sciences.

4. Other Business/Assignments

Dr. Tornquist is on a committee whose mission is to streamline Category I proposals. The committee was formed in anticipation of a large number of Category I proposals expected to be submitted in the next two years, including several related to the new branch campus in Bend. The Graduate Council has not been given a charge yet, but may eventually be asked to move Category I proposals through more

quickly.

Accreditation site visit by the Northwest Association of Schools and Colleges takes place on April 18-20. An evaluator needs to meet with Graduate Council, so members were asked to keep these dates open on their schedules.

Future meetings of the Graduate Council are scheduled for:

Thursday, April 12th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 26th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 10th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, May 24th	3:00-5:00pm	650 Kerr Admin. Bldg.

The following Category II proposals have been acted upon:

BA 528: This course proposal is approved.
BA 540: This course is approved.
BA 543: This course is approved.
BA 560: This course is approved.
BA 561: This course is approved.
BA 562: This course is approved.
BA 568: This course is approved.
BA 572: This course is approved.
BA 591: This course is approved.
01-C072
BA 511: The proposal to drop BA 511 is approved.
01-C073
BA 513: The proposal to drop BA 513 is approved.
01-C074
BA 521: The proposal to drop BA 521 is approved.
01-C075
BA 522: The proposal to drop BA 522 is approved.
01-C076
BA 530: The proposal to drop BA 530 is approved.
01-C077
BA 531: The proposal to drop BA 531 is approved.
BA 540: The proposal to change the current course BA 440/540 to BA 440 is approved. The new BA 540 is discussed in a separate message.
01-C078
BA 547: The proposal to drop BA 547 is approved.
BA 550: The proposal to change the title, credits, description and prerequisites for BA 550 is approved.
01-C079
BA554: The proposal to drop BA 554 is approved.
BA 555: The proposal to change the title, credits, description and prerequisites for BA 555 is approved.
01-C080
BA 556: The proposal to drop BA 556 is approved.
BA 560: The proposal to change the current course BA 460/560 to BA 460 is approved. The new BA 560 is discussed in a separate message.B
BA 562: The proposal to change the current course BA 462/562 to BA 462 is approved. The new BA 562 is discussed in a separate message.
BA 569: The proposal to change the title, credits, description and prerequisites for BA 569 is approved.
BA 571: The proposal to change the credits and description for BA 571 is approved.
BA 590: The proposal to change the title, credits, description and prerequisites for BA 590 is approved.

Graduate Council

March 8, 2001 Minutes

Present: Esbensen (Acting Chair), Ayres, Brandt, Cull, Ebbeck, Francis, Markle, Mishra, Prucha, Radosevich, Remcho, Rettig, Smith, Young

Absent: Tornquist (Chair), Niess, Remcho

1. MBA Program Design:

Because Graduate Council members did not receive materials for this discussion in time for review before the meeting, this agenda item was postponed until the March 22, 2001 meeting. Chandra Mishra (College of Business) suggested that in reading the material, Council members note that the revised program is more flexible and adaptive than the old one, having a design that connects different schools across campus.

2. Graduate Program Review Follow-up Reports:

The only two outstanding reports are those for Marine Resource Management and Entomology. Jeanette Brandt (Home Economics and Education) reported that the MRM report will be submitted shortly, and Steve Radosevich (Forestry) indicated the same for the Entomology report.

3. Approval to Proceed with Thesis Examination:

While discussion at previous Council meetings focused on the ♦Approval to Proceed♦ form, Dean Sally Francis (Graduate School) suggested that the Council take action on the issue as a policy instead of just approving a new form. If approved, this policy would be implemented by changing the language on the form. The proposed policy stated:

All members of the student♦s graduate committee must approve the scheduling of the final exam. In doing so, each committee member also must indicate in writing that he/she has received an examination copy of the thesis.

The only item of discussion was whether ♦in writing♦ included email; it was determined that email was not excluded by this language.

Paul Cull (Engineering) moved to accept the policy, with a second by Doug Markle (Agriculture). The Council voted unanimously in favor of the motion.

4. Posthumous award of graduate degrees:

Dean Francis opened discussion about forming guidelines for the awarding of posthumous degrees. No currently stated policy exists for undergraduates or graduate students. The Oregon State University Registrar has awarded ♦Certificates of Accomplishment♦ if an undergraduate student was too far away from completion of a degree at the time of death to be awarded the degree posthumously. The Curriculum Council is planning to take up the issue of undergraduate posthumous degrees in the near future. A graduate level ♦Certificate of Accomplishment♦ may be one award option for deceased graduate students.

Dean Francis stressed that the issue at hand was the awarding of academic degrees, as opposed to honorary degrees. As such, considerations of academic integrity are appropriate. She also emphasized the moral, ethical, and emotional aspects of this issue.

Other universities have policies that state that students must have ♦substantially met degree

requirements, but the definition of substantial was vague. Examples from University of Oregon and University of Virginia were provided to Council members. The University of Virginia's policy states,

Upon the recommendation of the faculty of the appropriate school, the general faculty of the University may make a posthumous award of the degree or degrees the student was pursuing if all requirements were likely to have been completed during the final year for which the student was registered had it not been for the intervention of death or debilitating illness. It shall be the responsibility of the Vice President for Student Affairs to assure that appropriate procedures to implement this policy are established in the various schools of the University. The policy shall be retroactive.

The University of Oregon's policy states,

Upon learning that a student has died, the Dean of Students will consult with the Registrar, the major department, and, where appropriate, the Dean of the Graduate School to determine if the student is eligible for a posthumous degree. If the student possessed appropriate academic credentials at the time of death, and the family wishes, the Dean of Students shall recommend that the University President authorize the posthumous issuance of the appropriate degree.

The procedural section of the University of Oregon's treatment of the issue states that the student would need to have satisfied requirements for the degree upon satisfactory completion of current course enrollment(s), and, if a thesis or dissertation was required, the student would need to have completed it during the current term or semester to be awarded the degree.

During the discussion the major points raised were the following:

- The definition of "substantially completed."
Some favored a statement that required the student to be able to finish in a term rather than a year, while others thought that was too restrictive. The timeframe needed to predict a student's completion of a program varies with department and program. Simply using the language "substantially completed" could get around this problem, and leave it up to the student's committee to decide, but should a percentage of required credit hours be specified to quantify "substantial?"
- The distinction between policy and procedure
- The appropriate person or group to testify to the criteria.
To what extent would the student's graduate advisory committee be involved in this decision? Steve Esbensen (Acting Chair, Science) strongly believed they should be involved in making the decision to award the degree. Court Smith (Liberal Arts) agreed that the faculty should lobby for the degree since they know the student's academic situation best. The major professor would be the most appropriate person.
- The frequency of the occurrence.
Mary Prucha (Coordinator of Graduate Services) noted that one posthumous graduate degree has been awarded in the past 10 years.
- The mechanism for informing interested parties that posthumous degrees are a possibility in the event of death.
Should the process be automatically triggered when a student dies? How? Who is the person or group most likely to be informed of a student's death? Concerns were raised about whether faculty members or the student's family would be adequately aware of the possibility of a posthumous degree, and whether the nature of the relationship between the student and his or her major professor could influence the possibility of the professor pursuing the possibility.
- The issue of academic integrity.
Some concern was raised that there would be no distinction between a posthumous degree and a regular degree. The Council generally agreed that, given the rarity of the situation, the possibility of diluting the integrity of Oregon State University's graduate degrees was remote.
- The possibility of announcing posthumous degrees separately at Commencement to increase awareness.

Dr. Esbensen suggested starting with the University of Oregon statement and modifying it, deleting the timeframe. Wording such as requirements substantially completed and student would likely have completed degree if it had not been for intervention of death would be appropriate. Also appropriate would be including language indicating that the major professor or committee (or department for programs without a thesis requirement) would be involved in the decision. Associate Dean Bruce Rettig will craft new language for consideration.

5. Relationship between Graduate Credits and Student Work Commitments

Associate Dean Rettig introduced this issue, which concerns the expectations that go along with thesis hours. In essence, how much work is expected of a graduate student for each credit of graduate thesis they take? The need from this discussion arose from various cases, including some in which professors and graduate students disagreed about how much work was expected of them and how that work would be measured (i.e. by hours in the lab or by accomplishments), and also from cases in which graduate students register for thesis hours for the quarter that they complete their thesis but have little work left to do on it.

It was suggested that the former case indicated a broken relationship between a student and his or her major professor. Another point was that the idea of physical presence in a lab is not reflective of what is involved in completing a thesis, so hours would not be an appropriate measure of work.

It was suggested that the latter case arises when students are required to sign up for many more hours than are required for their degree. In this instance, the real cause is over-enrollment of thesis hours, leading to the credits being misused. This problem would be difficult to remedy in a superficial way such as assigning a number of hours required per credit.

In response to the question of what would be an appropriate measure of work, Associate Dean Rettig gave his impression. The question should be: Is the student making progress? The measure should be outcome-based, not hours-based. For a rare number of incidents, a policy would be helpful; on the other hand it might be detrimental to form a policy in most cases. He agreed that problems originate at the faculty-student level. Communicating with faculty may be the best remedy.

An issue was raised concerning the requirement for graduate assistants to maintain enrollment at a minimum of 12 credits. Of particular concern involves students in non-thesis master's programs in which enrollment in non-graded thesis hours is inappropriate. Mary Prucha suggested one recommendation: to create a pass/no pass section for project hours (XX506) to be used in situations where additional enrollment is required, but for which A-F grading is inappropriate. These project hours could then be utilized much like thesis hours to fill out a student's registration. Another idea would be to use non-graded reading/conference hours or a non-graded colloquium. These recommendations were viewed as less than ideal because many faculty feel uncomfortable assigning even a pass/no pass grade when a student has not done any work that can be evaluated.

Dr. Ayres suggested that Associate Dean Rettig continue to mediate problem circumstances, but that the Graduate Council should not make a policy on this matter.

6. Other Business/Assignments

Future meetings of the Graduate Council are scheduled for:

Thursday, March 22nd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 12th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 26th	3:00-5:00pm	650 Kerr Admin. Bldg.

The following Category II proposals have been reviewed by Associate Dean Rettig on behalf of the Graduate Council:

01-C112

ST 565

This request to change the course title is approved.

01-C113

GEO 522

This request to change the course description is approved

01-C114

ST 553

This request to change the course description is approved.

ANS 515

This new course is approved.

The addition of an alternative prerequisite for ANTH 551, ANTH 552, and ANTH 587 has been approved.

Graduate Council

February 22, 2001 Minutes

Present: Remcho (Acting Chair), Brandt, Cull, Ebbeck, Esbensen, Francis, Markle, Prucha, Remcho, Rettig, and Young

Absent: Ayres, Mishra, Niess, Radosevich, Smith, and Tornquist

Guests: Jack Higginbotham from Nuclear Engineering and Joan Gross from Anthropology

1. Introductions. Upcoming Agenda Items. Operational Issues

The Council had no comments on or amendments to the minutes from the last meeting (February 8, 2001).

2. PhD Residency Requirement

Bruce Rettig shared information on PhD residency requirements at selected peer institutions and Paul Cull (College of Engineering) added information about additional universities in the PAC-10 Conference. Several Council members concluded that OSU requirements were reasonable and consistent with peer programs.

Doug Markle (College of Agricultural Sciences) suggested that the language in the current requirement that "The student must spend at least three terms of full-time graduate academic work (at least 9 credits/term) on site at the Corvallis campus or at an off-campus site approved by the Graduate School" did not clearly identify work at the Hatfield Marine Science Center as an approved site. It was moved and seconded to change the wording in the Graduate Catalog from "on site at the Corvallis campus" to "on campus." The motion passed unanimously.

3. Fisheries and Wildlife Follow-up Report

Dr. Paul Cull and Dr. Vicki Ebbeck presented the follow-up report on the Graduate Council Program Review of the program in the Department of Fisheries and Wildlife (see attached report). They visited with Interim Department Head Dan Edge regarding topics identified as points of concern in the 1996 graduate program review. The areas of concern were (1) space, (2) teaching FTE, (3) computing resources, and a revision of the graduate (and undergraduate instructional programs). Professors Cull and Ebbeck concluded that, "There has been progress in the Fisheries and Wildlife department since the 1996 review. The undergraduate program has been revised and there has been a large increase in research funding. Unfortunately, the graduate program is still a cause for concern. The graduate instructional program needs revision. More space for graduate students is necessary. Funding mechanisms which allow graduate students to complete their degrees in a timely manner need to be put in place."

A motion to approve the review and forward it to Provost White was made and seconded. All were in favor.

4. Graduate Faculty Status

At the Graduate Council meeting on February 8, 2001, the Graduate Council agreed to add a provision requiring that a department chair or head who proposed a reduction in graduate faculty responsibilities first communicate this to that faculty member before contacting the Graduate School. At this Council meeting, a motion was made to so amend the language and to further edit the language in the Faculty Handbook. The motion was seconded and approved. The revised statement on graduate faculty status is attached to the end of these minutes.

5. Conditional Admission Requirements

Following general discussion of the use of conditional admission status, the Council agreed to table this issue until after the release of the report of a special Task Force examining graduate admission procedures at

Oregon State. Dean Rettig indicated that a report should be submitted to Dean Francis and Admissions and Orientation Director Bontrager by March 1, 2001.

6. Task Force on Graduate Level Learning

Jack Higginbotham (Nuclear Engineering and former Associate Dean of the Graduate School), reported on the work of the Task Force on Graduate Level Learning, which he has been chairing. This group, created by Dean Francis in April 2000, was asked to 1) analyze the extent to which the 4XX/5XX format comprises graduate curricula at OSU, 2) determine the effectiveness of graduate courses that are offered in the 4XX/5XX format in providing a compelling and meaningful graduate level experience, 3) identify any variable that might influence the effectiveness of 4XX/5XX courses in regard to graduate level learning, 4) compile approaches used at OSU to respond to current Graduate Council policy regarding the teaching of 4XX/5XX courses, and 5) develop specific recommendations to ensure a graduate level learning experience in every graduate course, including graduate courses that are offered in the 4XX/5XX format, suggest the process for implementing each recommendation and estimate the resources required for implementing each recommendation.

Although the Task Force has been very active and has compiled much information, Dr. Higginbotham indicated that the report will not be completed until an analysis of data collected from students enrolled in 4XX/5XX courses Fall 2000 has been completed. Dr. Higginbotham was reluctant to draw many conclusions at this time. He did indicate that the Task Force hopes to finish its work in the next few weeks.

7. Thesis Issues

Carl Schreck (Department of Fisheries and Wildlife) forwarded questions from students in his department about the Graduate School thesis requirement which states, "The bibliography (references) should be in the same form for the entire thesis and presented as a single comprehensive reference section." Although many Council members strongly supported the current requirements for master's and doctoral theses, they were willing to entertain a request for an alternate format, such as one that would include references at the end of each chapter. Dean Rettig agreed to contact Fisheries and Wildlife to encourage that department to submit a proposal for an alternate format that fully meets requirements for doctoral dissertations while reflecting representing publication styles in the discipline.

8. Other Business/Assignments

Future meetings of the Graduate Council are scheduled for:

Thursday, March 8th	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, March 22nd	3:00-5:00pm	650 Kerr Admin. Bldg.
Thursday, April 12th	3:00-5:00pm	650 Kerr Admin. Bldg.

Attachment A. Fisheries and Wildlife Follow-up Review

On February 1, Paul Cull and Vicki Ebbeck, from the Graduate Council, met with Dan Edge, interim chairman of the Fisheries and Wildlife Department to discuss the outcomes of the Graduate Council's 1996 review of the graduate programs of the department. The review actually dealt with both the graduate and undergraduate programs, but we tried to focus our discussion on the graduate programs. We discussed the areas of concern given in the review and we will deal with each in turn.

The areas of concern were:

- Space
- Teaching FTE
- Computing Resources
- Revision of the Graduate (and Undergraduate) Instructional Programs
- Collaboration with Other Departments

SPACE:

As with many departments on campus, sufficient space for instruction and research was (and is) a cause for concern in the Fisheries and Wildlife Department. According to the interim chair, in the five years since the review, the department has not been given any additional space, and a space audit shows that the department has less than half the space it needs. The department has been able to reallocate some space internally. For example, they converted a constant temperature lab into 8 graduate student offices. They have sufficient space for a teaching laboratory. They will need more research lab space for new faculty. Most of the present space is in Nash Hall, but there is more space several blocks away at Weniger Hall. Because of

the distance from the rest of the department, the Weniger space is considered to be less desirable. Although not an area of concern to the department chair, faculty would probably prefer to have more classrooms in Nash or nearby, because at the moment most classes are taught at rooms distributed across campus. In conclusion, space continues to be a major area for concern. In particular, lack of space impacts graduate education because few of the approximately 80 enrolled graduate students have work or office space.

TEACHING FTE:

Teaching FTE was listed as a cause for concern in the review. Since the review, one FTE for teaching has been added. According to the interim chair, the FTE is spread over a number of people who each do a small amount of teaching. The department makes heavy use of and the graduate program depends upon using part-time faculty and faculty whose major responsibility is not teaching. The department is recruiting for 3 faculty positions, but 2 of these are retirement replacements. Surprisingly, there is no college funded FTE assigned for teaching assistants.

In conclusion, it seems that teaching FTE is still a cause for concern.

COMPUTING RESOURCES:

According to the interim chair, this is no longer a matter of concern. All faculty members have one or two machines and research grants provide machines for graduate research projects. Some high end printing and imaging devices would be nice, but access to this equipment can be obtained with a little effort at other locations on campus. Further, in the present most (many) students have their own computers, so this issue is not a cause for concern.

REVISION OF GRADUATE INSTRUCTION PROGRAM: Since the review, the department has revised its undergraduate programs and as far as we can tell, the revision has been successful. It seems that no action has been taken with regard to the graduate program. Most of the graduate offerings by regular faculty are 400/500 courses. Most of the 500 and above courses are taught by courtesy faculty. It seems that a large part of each graduate student's program consists of courses offered by other departments. For example, all, or almost all graduate students take at least three graduate courses in statistics. Most graduate students are accepted with a research assistantship. These generally run for two years and there does not seem to be a mechanism to fund students after the end of these assistantships. As a result, the interim chair estimated that there are currently about 40 students who have not completed their degrees and who are not currently enrolled. In conclusion, we think that the graduate program is a cause for concern. The three issues that needed to be addressed are:

- over reliance on 400/500 courses
- few regular 500 course offerings
- students being left unsupported and not finishing their degrees in a timely fashion.

COLLABORATION WITH OTHER DEPARTMENTS:

The Fisheries and Wildlife Department has been very successful in attracting research grants. According to the interim chair, they had \$6 million in grants last year and are planning on 8 to 9 million for next year. Many of these grants have been inter-disciplinary and inter-institutional collaborating, for example, with the College of Forestry at OSU and the Landscape Department at U of O.

As we mentioned above, graduate students take many of their courses outside the F & W department. In a sense, this is a collaboration with other departments. We noticed one anomaly. There seems to be little or no collaboration either in research or teaching with other departments in the College of Agricultural Science. Perhaps, Fisheries and Wildlife should be relocated to a unit which includes departments with which it does collaborate.

CONCLUSION:

There has been progress in the Fisheries and Wildlife department since the 1996 review. The undergraduate program has been revised and there has been a large increase in research funding. Unfortunately, the graduate program is still a cause for concern. The graduate instructional program needs revision. More space for graduate students is necessary. Funding mechanisms which allow graduate students to complete their degrees in a timely manner need to be put in place.

Attachment B. Graduate Faculty Status

Membership on the Graduate Faculty

(as approved by Graduate Council on February 22, 2001)

The graduate faculty is selected from the University faculty on the basis of academic training, experience, demonstrated potential for creative work and scholarly research, and evidence of the ability and competency essential to directing and supervising graduate students in their pursuit of advanced knowledge.

Faculty members are nominated to graduate faculty status by the head or chair of the academic unit and the academic dean of that college or school. The Graduate Council gives final review and approval. Each graduate faculty member is authorized for specific graduate activities within a particular academic unit. These activities may include: (a) teaching graduate courses, (b) directing non-thesis students, (c) serving on thesis committees, (d) directing master's theses and, (e) directing doctoral theses. In some cases, a faculty member's activities are limited to a specific student's committee.

The same process for nomination to Graduate Faculty will be used for the removal or reduction in responsibility of Graduate Faculty Status when the Graduate Faculty member's status initially provided for continuing research or teaching duties. Before a regular faculty member's graduate faculty activities are reduced, the head or chair of the academic unit will write a letter to that faculty member, notifying him or her of the intent to change responsibilities. Cases in which the faculty member was hired for a fixed term/assignment, retired, died, moved or became inactive will be exempt from the removal process.

Graduate faculty members with the appropriate authorized activities will be called upon, on occasion, to act as a Graduate Council Representative (GCR). A GCR is required on the committees of master's degree students who are writing a thesis, on Master of Arts in Interdisciplinary Studies committees, and on all doctoral committees. As the title suggests, a GCR is the representative of the Graduate Council on a graduate student's committee and interprets institutional policy concerning graduate degree requirements.
